LABOR JOURNALISM

Over the past 200 years, the role of labor journalism has evolved with ebbs and flows of the labor movement, both in the United States and throughout the developed world. Coverage of labor issues in the media, which peaked in the early and mid-20th century, has been in decline in the past several decades. Although increased attention has been paid to union-related stories since the mid-2010s, labor coverage faces an uncertain future, according to media scholars.

The decline of private-sector unions and staffing cuts at news organizations since the 1980s have resulted in the near extinction of the labor beat in American journalism. In recent years, according to communications scholar Jon Bekken (2020), most mainstream media coverage of labor issues has focused on local teacher strikes for greater pay and benefits. And this coverage tends to focus on the health of local public education, with less focus on workers themselves. Greater media coverage is given to the financial health of employers in the public and private sector.

Labor journalism first came into its own early in the 19th century. Its emergence was due to the rise of factory employment in the United States, which resulted in class distinctions not apparent at the founding of the country. Also, substandard working conditions led to discontent, which needed a media outlet. Although expression of some of this discontent was reflected in the coverage of the working class in the mid-19th-century

penny press, a ready market also existed for serious investigative journalism geared specifically for workers and their political allies. After briefly reviewing the various types of labor publications, this entry discusses the emergence and development of labor journalism.

Types

Throughout their history in the United States, three types of labor publications have dominated. The first is trade union periodicals. These periodicals are published by individual unions, with union money, and circulated mainly to union members. They serve as mouthpieces for labor unions and their officials. They also dispense information to other media, which can lead to wider coverage. Publications within this category are *Solidarity*, the national magazine of the United Auto Workers; *UMW Journal*, a bimonthly publication of the United Mine Workers of America; and *American Educator*, published by the American Federation of Teachers.

The second is party papers, published by political parties and intended to promote a social agenda connected with progressive politics. These publications were strongest in the early 20th century, when political parties advocated for worker reforms often influenced by world events.

The third type of publication is independent labor newspapers unaffiliated with any political party and dependent on subscriptions for their survival. However, the close connection between worker rights and political activism has often

blurred distinctions between the second and third types of labor publications. Today, independent labor newspapers, which rely on ideological fervor but depend on subscriptions and advertising for a profit, still survive, but not at the local level. Although local independent labor newspapers thrived for a time in the 19th and early 20th centuries, they eventually disappeared due to lack of advertising support and the co-optation of many of their issues by the mainstream press.

Development

Labor journalism in the United States began with the rise of publications concerned with reform in working conditions that depended on subscriptions and donations for their survival. Perhaps because of this content-advertising dichotomy, many of these publications proved short-lived. During the 1820s and 1830s, approximately 50 labor weeklies appeared, most of them in the rapidly industrializing northeastern United States. These publications not only advocated for better working conditions but also expanded to social commentary on topics such as the need for universal education. The *Mechanic's Free Press*, founded in 1828, in Philadelphia, was the first labor newspaper. It folded after 3 years, though it did reach a circulation of 2,000. Other early papers included the *Free Enquirer*, published in New York from 1828 to 1835, and *The Working Man's Advocate*, published in New York from 1829 to 1849. The *Advocate* supported a 10-hour working day, universal suffrage, and improved public education. The paper also was critical of mainstream media, which it said had grown "fat" by oppressing the working class.

These papers served not only as a form of early labor solidarity but also as a way of encouraging political activism. In 1828, the *Mechanic's Free Press* became the official organ of the Working Men's Party, which that year elected 21 candidates to public office in Philadelphia and surrounding communities. The party expanded its efforts into other areas of Pennsylvania. In New York, the *Free Enquirer* and *The Working Man's Advocate* advocated political action as well. In 1830, the entire labor ticket won in Syracuse, and all but one labor candidate was victorious in Troy and Albany. The labor political movement, supported

by labor media, also gained a foothold in this period in local and state offices in Delaware, New Hampshire, and Connecticut. In the 1830s, responding to the threat by this potential national third party, the two major political parties, the Whigs and Democrats, adopted many of the suggested reforms into their party platforms.

Independent labor newspapers continued their expansion throughout the middle and latter part of the 19th century. In Canada, the labor press movement also thrived between 1870 and 1900 due to a perceived need to rein in unbridled capitalism. During this period, Canadian trade unionists founded more than 100 journals, mainly in Ontario and Quebec. Canadian labor journalism was hostile to both the Protestant and Catholic Churches, which tended to side with capitalistic interests rather than workers. The first major Canadian labor journal, *The Ontario Workman*, published from 1872 to 1874, arose out of a dispute following a strike at the *Toronto Globe*. The *Workman* was published with financial assistance from the federal Conservative Party, which believed it to be in its own interest to harness support from the growing ranks of industrialized labor.

In the United States, relations between labor and government did not proceed quite so smoothly. The Haymarket Affair (also known as the Haymarket Riot) in Chicago in 1886, proved to be a temporary setback for the labor press. As the police were dispersing a labor protest, an unknown person threw a bomb, which resulted in the death of seven police officers and a number of civilians. The Haymarket Affair came to symbolize an anarchistic labor movement threatening American capitalism.

A New Era

Following the Haymarket Affair, a new era of labor journalism emerged, with a stronger tie to political parties and worldwide working concerns. This era was dominated by papers published by political parties and intended to promote a social agenda connected with progressive politics. An example of this type of journalism was the "Wobbly" papers, published by the Industrial Workers of the World (IWW), beginning in 1905. They shared disgust with the American Federation

of Labor's conservative domination of trade unionism, and many saw their publications as a vanguard of a Socialist revolution. Among the Wobbly papers were the *Industrial Union Bulletin*, published in Chicago from 1907 to 1909; *The Syndicalist*, published in Lakebay, Washington, and Chicago in 1913; *One Big Union Monthly*, published in Chicago from 1919 to 1921; *The Industrial Pioneer*, published in Chicago from 1921 to 1926; and *Industrial Unionist*, published in Portland, Oregon, from 1925 to 1926.

Mainstream media also spoke with a more progressive labor voice during this same period. At the end of the 19th and beginning of the 20th centuries, newspaper publisher Joseph Pulitzer championed the cause of working men and women in his papers, *New York World* and *St. Louis Dispatch*. Pulitzer's New York newspaper war with rival publisher William Randolph Hearst added to this focus on the working-class reader's interests.

The turn of the 20th century saw the emergence in mainstream journalism of Eva Valesh, a prominent voice of progressive labor journalism. Recruited in 1887 to write for the *St. Paul Globe*, Valesh (writing under the pseudonym Eva Gay) got herself hired as a working girl in various shops in order to illustrate the life of the working poor. Valesh went on to become an advocate for labor rights and other causes.

The early 20th century proved a high watermark for socialist labor journalism, coinciding with muckraking journalism by reformers such as Ida Tarbell, Lincoln Steffens, and Upton Sinclair. Between 1905 and 1919, the IWW published more than 70 newspapers and periodicals. The Socialist weekly *Appeal to Reason* had more than 760,000 readers in 1913. Daily labor newspapers before World War I included the *Cleveland* (Ohio) *Citizen*, *The New York Call*, and *The Milwaukee* (Wisconsin) *Leader*.

Labor in the Age of Bolshevism

After 1920 came a decline in the socialist labor press, as it became identified by the American public with the rise of Bolshevism. Indeed, the Communist, Socialist, and Communist Labor parties all competed through the labor press for predominance. The intensity of this struggle was reflected in postwar journalism when Bolsheviks

seeking violent overthrow of capitalist regimes withdrew from the Socialist Party. *The Class Struggle*, a left-wing socialist publication published in New York from 1917 to 1919, was a pre-Bolshevik publication that argued that socialism could not be achieved through reform or at the polls. *The Class Struggle* called for the victory of the proletariat over the capitalist bourgeoisie and regularly published articles by leaders of the Russian Communist Revolution, such as Vladimir Lenin and Leon Trotsky. Other worker-oriented political publications of the Bolshevik Revolution era included the *New York Communist*, published in 1919; *The Revolutionary Age*, published in Boston and New York in 1918 and 1919; *The Socialist*, published in New York in 1919; and *The New Justice*, published in Los Angeles in 1919 and 1920. Growing American anti-Red fears drove many of these papers either underground or out of business.

After the expulsion of Communists from its ranks in 1919, socialism went into a gradual decline after World War I, though the socialist movement did recover for a time during the Depression of the 1930s as new worker-oriented papers spread that served as voices for reform. Socialist publications of this period included *New Day*, published in Chicago and Milwaukee between 1920 and 1922; *Socialist World*, published in Chicago between 1920 and 1926; and *American Appeal*, published in Chicago from 1926 to 1927. Three New York-based publications of the period included *American Socialist Quarterly* (1932–1935), *American Socialist Monthly* (1935–1937), and *Socialist Review* (1937–1940). By the 1940s, the Socialist labor press was in a weakened state, though *Challenge!*, the periodical of the Young People's Socialist League, managed to publish between 1943 and 1946 in New York. This publication had an influential role in shaping post-World War II sentiment through shaping the postwar generation's attitudes toward international and social issues. The Young People's Socialist League members who read *Challenge!*, with its virulent anti-Hitlerism, its promotion of peace "strikes" on college campuses, and its support for labor demands would go on to become some of the nation's leading liberals, intellectuals, and trade union leaders. For

this reason, the League was probably more influential in this period than the Socialist Party itself.

In the New Deal and World War II years, the Communist workers press also served to promote labor rights. In an era when support for the Soviet Union fit American foreign policy aims, publications such as *Communist International*, published in New York from 1919 to 1940, and *The Daily Worker*, published in Chicago and New York from 1924 to 1958, had influence in labor and left-wing political circles.

Labor Broadcasting

Organized labor's attempts to get involved directly in broadcasting during the 1920s and 1930s met with mixed results. Organized labor attempted to establish and operate radio stations but gained little headway. One exception was WLCF in Chicago, owned and operated by the Chicago Federation of Labor, which began in the 1920s and continued to operate as a voice of labor until 1979. In the 1940s and 1950s, the American Federation of Labor, later the AFL-CIO, sponsored evening newscasts and aired public service announcements made possible by Federal Communications Commission guidelines. In the 1950s, the AFL-CIO attempted to get into television broadcasting, but high production costs thwarted these efforts.

Modern Labor Press

The independent labor newspapers that launched labor journalism early in the 19th century survived into the early 21st century, but in a much diminished state. Although they thrived from the 19th and, in some cases, into the middle of the 20th century, local labor publications eventually disappeared due to lack of advertising support and the cooptation of many of their issues by the mainstream press. In contrast, their progeny at a national level, including the *Union Democracy Review*, published since 1972, a bimonthly publication of the Association for Union Democracy; and *Labor Notes*, published since 1979, a monthly magazine published by the nonprofit organization with the same name, still promote workplace and grassroots democracy. Both publications have

websites and continue to rely on contributions and subscriptions for their survival.

With the decline in the independent labor press, covering organized labor has fallen to mainstream media. While some communities with a strong union tradition (such as Detroit and Chicago) have media that incorporate labor coverage into their news agenda, this is the exception. Network television in its heyday in the 1960s and 1970s exposed few viewers to people who worked in factories, and this situation has not improved much since.

In the early 21st century, because of cutbacks in reporting staffs and ownership consolidation, few newspapers or television stations assigned reporters to a labor beat. What coverage did exist tended to focus on strikes or potential strikes. Covering labor became a matter of refocusing and filtering labor news and trends into a broader news context. As a result, each medium tended to focus on labor union stereotypes, such as the movies' frequent focus on connections between organized crime and labor. Television, in turn, tended to portray the union bargaining goals as petty or foolish, with good local labor leaders led astray by their national unions.

However, events throughout the previous decade have contributed to increased attention to union-related stories in the news. According to Harvard researcher Hannah Finnie, since June 2015, when news site Gawker initiated a wave of unionization, at least 80 media organizations in the United States, United Kingdom, and Canada followed with unionization. Moreover, the 2018 teachers' strikes in the United States raised the profile of the topic in general. Journalists at the same time have developed an increased interest in the subject of unions, as journalists who may have worked in unionized organizations have relocated and brought unionized influences to nonunionized jobs. As a result, previous unionization movements have at least increased the effectiveness of reporters to describe labor issues.

Throughout its evolution and development, labor journalism has played an important role in promoting progressive change. Labor publications have championed reforms such as child labor laws, workplace safety, improved public education, and universal suffrage.

LABOR UNIONS IN MEDIA

Media workers encompass employees, freelance and contract contributors, interns, and apprentices in journalism, including newsroom workers—reporters, editors, photographers, and videographers—and workers in the production, printing, advertising, and circulation departments. A labor union is a collective organization that workers form to protect their interests and rights in the workplace. A craft union is a model of unionism in which workers organize around a particular trade, such as reporters or print workers, while an industrial union represents workers across an industry regardless of trade or skill. Media workers in the United States, Canada, and the United Kingdom have long organized labor unions to improve their pay rates, benefits, working conditions, and training programs; defend their rights in the workplace; and respond to technological change. They have also promoted social justice around diversity, equity, and professionalism in media industries. While media workers initially launched trade unions in the 18th century, they have increasingly established big industrial unions since the mid-20th century. This entry examines the history of labor unions in the media, some notable labor unions in the print and broadcast media fields, labor union

organizing in an era of digital media, and the increasing unionization of freelance journalists.

The Early History of Labor Unions in Print Media

Before print media workers created ongoing trade unions, they established temporary printers' associations, dealing with workplace grievances as they arose. Journeymen printers started one such association in New York City in 1776. The printers united, demanding higher wages, and when their employers begrudgingly granted them a wage increase, the printers' association disbanded. Ten years later, 26 printers in Philadelphia launched the first strike of workers across a single trade in the United States. When the printers won a six-dollar-a-week wage increase, they, too, dissolved their association shortly after. Around this time, a society of compositors also negotiated a piece-work scale of wages in London, England, in 1785.

Throughout the next century, printers launched longer-lasting unions. Initially, these unions included the New York-based Typographical Society (1795–1798), the Franklin Typographical Society of Journeyman Printers of New York (1799–1804), the New York Typographical Society (1809–1826), and the Philadelphia Typographical Society (1802–1831). Sixty-six printers in Quebec City organized the first such ongoing union of printers in Canada in 1827. In 1836, the pioneering National Typographical Society (becoming the National Typographical Association in 1837) was formed in Washington, D.C. bringing together many union locals known as *chapels*. However, the association dissolved within 3 years due to struggles during the 1834–1837 Depression. Yet the printers regrouped, starting the National Typographical Union in May 1852. The union adopted a new constitution in 1869, accepting Canadian members and becoming the International Typographical Union (ITU). As print media companies introduced new technology into the workplace at that time, other craft workers, such as stereotypers, bookbinders, and pressmen organized, initially joining ITU. By 1882, though, some craft workers asserted their own identity: the International Brotherhood of Bookbinders and the Lithographers and Photoengravers of

America were formed, while the International Printing Pressmen's Union was founded in 1887.

In the 19th century, ITU took a progressive stance compared to other unions regarding gender and racial diversity and equity issues. While ITU vigorously opposed the Women's Typographical Union No. 1 of New York City for 15 years, it finally chartered the union in 1869. Although ITU revoked part of its constitution in 1873 that permitted female members, its 1885 General Laws noted that the union should not refuse women members based on sex. Three years later, ITU instructed its locals to organize female workers and pay equal wages for the same work regardless of sex. ITU had also declared in 1869 that union locals had discretion to admit Black workers.

The Evolution of Editorial Workers' Unions

Labor unions have advocated for higher wages and better working conditions for editorial workers since 1891. A wage disparity between the unorganized editorial workers and the organized newspaper workers in production departments became an issue around which the former mobilized in the United States, initially in Pittsburgh, Denver, Sacramento, and New York. The movement to organize news writers spread to Canada between 1902 and 1904, when three ITU locals were established. ITU chartered the first Canadian news writers' local in Ottawa, but like its counterparts in the United States, it was short lived, suspended in 1903 as a result of nonpayment of membership dues. Around this time in the United Kingdom, the National Union of Journalists (NUJ) was founded in 1907, and by 2020, it had more than 30,000 members. Yet ITU news writers' locals continued to struggle until 1923, when ITU relinquished jurisdiction of news writers to the American Federation of Labor.

By 1933, American editorial workers realized that they needed their own parent union to represent them. Led by Heywood Broun, they established the American Newspaper Guild (ANG), mobilizing mainly around higher pay. Broun also led the organizing efforts of his local union, the Newspaper Guild of New York in 1934 (now the NewsGuild of New York). In 1937, workers in

the commercial departments of print publications started joining ANG. Continuing to expand its membership, ANG chartered the Wire Service Guild (now the News Media Guild) as an autonomous union local in March 1958, initially including members from the three wire services at the time—International News Service, United Press, and Associated Press.

From the outset, ANG organized editorial workers in Canada, initially in Toronto and Montreal in September 1936. A small group of editorial workers at Toronto newspapers, many of whom were women, aimed to unionize the city's four daily newspapers, and the Toronto Newspaper Guild (TTNG), Local 87 of ANG, was born (now Unifor 87-M). Some newspaper workers in British Columbia organized and obtained collective agreements with autonomous unions: Workers at the *Vancouver Sun* started the Vancouver Newspaper Guild in 1941 and won a contract in 1942, with wage increases, severance pay, and overtime provisions, while the Victoria Island Newspaper Guild (VING) was founded in 1945, securing a contract in 1946. By the end of the decade, ANG won its first collective agreement in Canada at the *Toronto Star* in 1949, resulting in a monumental pay increase for reporters and photographers with at least 5 years of experience. That year, the Canadian Wire Service Guild was also formed (now the Canadian Media Guild/CMG).

As ANG's membership continued to grow outside of the United States as well as include more people of color and women members, the union's members sought special recognition. In 1951, Canada was established as a "region" in the union. During the 1960s, VING played an instrumental role in mobilizing ANG members to remove "American" from the union's name to reflect that it had Canadian members. In 1971, ANG became The Newspaper Guild (TNG). Soon after, the union committed to opening a Canadian office and appointing a Canadian director. In the midst of the Civil Rights Movement of the 1960s, TNG also combated racial discrimination in the news industry in hiring and promotion. In the 1970s, TNG addressed sex discrimination in the news workplace. By 2015, the union changed its name to The NewsGuild (TNG), recognizing that it represented more than newspaper workers.

Entertainment Media Workers Unionize

As editorial workers organized in the 1930s, entertainment media workers followed suit. The Screen Actors Guild (SAG) was formed in Los Angeles as a self-governing organization of film actors and, later, background actors and extras in 1933. Four years later, SAG obtained its first contract with producers, the same year that the American Federation of Radio Artists (AFRA) was founded. AFRA negotiated its first national-level collective agreement with NBC and CBS in 1938. In these formative years, union members discussed plans to merge these performers' guild into one big union, but by 1940, they had failed to make progress on this front. In the 1940s, background actors and extras strived for more autonomy, leaving SAG to start the Screen Players Union in 1945. At the time, diversity was a central concern of SAG: The union adopted a resolution in 1946 to oppose discrimination against Black people in the film industry. As television was introduced, the Television Authority of the Associated Actors and Artistes of America was formed in 1949 to represent television actors until joining AFRA in 1952, becoming the American Federation of Television and Radio Artists (AFTRA). Yet that was not the only union merger. In 1954, the Screen Writers Guild united with the TV Writers Guild and the Radio Writers Guild to launch the Writers Guild of America (WGA). Later that year, AFTRA adopted a no discrimination clause for its 1952–1954 television Network Code, stating that producers shall not discriminate against any person due to race, sex, creed, color, or national origin.

Journalism Workers' Unions Converge Across Media Industries

Newspaper unions adopted a strategy of labor convergence that can be traced back to the 1950s. At the time, media chains had grown and become more powerful, adopting a strategy of corporate convergence, so newspaper unions considered merging with other media and communication workers' unions, consolidating their contract negotiations to strengthen their collective bargaining power. Unions such as TNG, ITU, and the

Communications Workers of America (CWA) discussed plans to merge and organize workers across the print, telecommunications, and broadcasting industries, among others. Their newspaper members came from both editorial and production departments in the United States and Canada.

In the 1960s and 1970s, the unions became more concerned with technological change. ITU was a craft union that had been losing members due to the introduction of computerized typesetting. Automation was streamlining the production process and deskilling newspaper workers' labor. After years of internal debate, ITU members finally voted to merge with CWA in 1986, joining the union's more than 600,000 members, most of whom were telephone and telecommunications workers. Recognizing the distinct nature of these members' work, CWA established a Publishing and Media Workers Sector in 1987.

Left on its own, TNG spent the next decade exploring merger options. In 1995, TNG, representing about 40,000 members, voted to endorse a merger with CWA. The merger agreement recognized that TNG could retain its autonomy and benefit from the expertise and enhanced power of a bigger union, which had become vital due to technological and corporate convergence. TNG also granted its Canadian members special recognition, founding TNG Canada, which could still access the international TNG benefits, among them the union's defense fund. TNG officially became part of CWA's media sector in 1997, while TNG Canada became TNG Canada/CWA. TNG Canada/CWA was officially recognized as autonomous within CWA in 2007, changing its name to CWA Canada.

In addition, the Communications, Energy, and Paperworkers Union (CEP) was formed in Canada in 1992 when three unions merged: the Communications and Electrical Workers of Canada, the Energy and Chemical Workers Union, and the Canadian Paperworkers Union. After the merger, CEP had 15,000 members in its media section. A major outcome of such labor convergence was that TTNG left the international TNG in 1994 and affiliated with CEP (now Unifor). The newspaper unions had shifted from craft-based to cross-industrial-type collective organizations.

Media Workers Unite in the Digital Era

Online employees at newspapers, such as *The New York Times*, started joining TNG locals like the NewsGuild of New York as far back as 1995, soon after the Web became commercialized. Likewise, TNG secured a collective agreement in 2001 between the *San Francisco Chronicle* and its online editorial and advertising employees. In the early 21st century, workers at new media companies also began organizing unions. For instance, NUJ won union recognition at AOL UK in 2005. In the United States, workers at *Truthout*, a non-profit outlet, became the first online-only news organization to join a labor union—the St. Louis Newspaper Guild (now United Media Guild) in 2009. In Canada, about 15 staff members at *Canoe.ca* joined Unifor 87-M in 2015, becoming the first group of workers at a stand-alone online news outlet to unionize in the country.

In June 2015, employees at *Gawker.com*, an online-only media news site, joined WGA, East, leading workers at more than 60 digital-only and legacy news media organizations to unionize with WGA, East or TNG. By November 2019, over 2,600 workers formed 23 unions with WGA, East, covering 64 media outlets, including VICE, HuffPost, Vox Media, and Hearst Media. Workers at *BuzzFeed* and legacy media outlets, such as the *Los Angeles Times*, *Chicago Tribune*, and *The New Yorker*, had joined TNG. While these workers have typically organized around long-standing issues, such as decent pay, benefits, and more editorial control, they have also emphasized efforts to improve racial, ethnic, and gender diversity in the media workforce and in media content.

This movement to unionize workers at digital media outlets spread to Canada when VICE Canada employees formed a bargaining unit within CWA Canada local CMG in late 2015. *BuzzFeed Canada* and *The National Observer* workers joined CWA Canada in 2019 and 2020, respectively. VICE UK workers also organized, but management thwarted their unionization efforts in 2016, opting instead to launch an internal staff council. Yet the VICE UK NUJ chapel achieved official union recognition with the company in 2019. The VICE Canada and VICE UK workers said that the organizing efforts in the United States inspired them to organize.

Freelance Contributors and Student Interns Join Media Unions

Freelance writers have also united with media employees. In the United Kingdom, freelance journalists have been able to join NUJ since it was founded in 1907. The union created a special freelance branch in 1951, and by 1973, the union had secured agreements with some publishers that standardized rates for freelance contributors. In the 2000s, NUJ secured agreements, including for casual workers on employers' premises and an agreement with the Guardian Media Group in 2000 that lays out standard rates for freelance contributors. In Canada, CMG started a freelance branch in 1998. The CMG Freelance Branch united with the Professional Writers Association of Canada in 2020, forming the Canadian Freelance Guild within parent union CWA Canada. In addition, the Canadian Freelance Union was established in 2009 as a CEP local (now Unifor) to represent independent media workers. In the United States, the National Writers Union (NWU) was created in 1981 to represent writers in all genres, including journalism, advocating for better pay and treatment of workers. NWU has negotiated voluntary freelance contributors' agreements with media outlets including *The Nation*, *Jacobin*, and *In These Times* that set standards for rates, payment, and grievance procedures. In 2009, TNG local Pacific Media Workers Guild launched a special unit called *Guild Freelancers*, while the Chicago News Guild, another TNG local, started the bargaining unit Working Journalists for freelance media professionals in 2013.

In addition, labor unions have established programs to protect journalism student interns. NUJ has a special category of student associate membership that is open to journalism students or those who work in student media over the age of 16. Membership costs £30 for the duration of a student's studies. In 2011, CWA Canada launched a free associate members program to advocate for as well as provide student journalists and recent graduates with access to paid internship programs (such as the Canadian Press newswire service), mentoring opportunities, and professional development events. Unions have also advocated for language in collective agreements and in labor legislation that supports paid internships with an

educational value. *VICE Canada* is an example of a media outlet that incorporated such intern language in its first collective agreement in 2016. By representing freelance contributors and interns, media workers' collective organizations have further become big industrial unions.

LATINO NEWS MEDIA

Latino news is a product of bilingual journalism practices that require bicultural competencies to gather, assess, present, and disseminate news and information about, or relevant to, Latino communities. Offered in Spanish, English, or bilingually, it engages with the understanding of current affairs, but also the history, economics, politics, and culture of diverse groups, whether U.S.-born or immigrants, as well as their global liaisons with countries where they trace their origins.

Throughout more than 200 years, Latino news media have evolved from the transformations of the communities they serve. The landscape has been broad and heterogeneous in its patterns of production, distribution, and consumption. Its nature is related to the history, politics, and economics of U.S.-Latin American relations, the U.S. and Latin American news media industries, and how they have intertwined over the past two centuries.

While Latinos' needs of information and self-representation have remained constant, the ways they consume their news have been changing. Throughout the years, and more specifically in the last two decades, technological and economic forces have transformed general news media, and the fragmentation of ethnic media—which historically played a significant role in the development of immigrant communities—presents challenges and opportunities for bilingual news.

Latino news outlets' editorial profile has ranged from politically conservative to liberal and reflected the status of their audiences as exiles, refugees, immigrants, or U.S.-born Latinos. Ownership has varied from private to noncommercial, from subsidized enterprises to community-based projects, from U.S. Latino initiatives to Latin American foreign investment ventures. Latino news coverage has ranged from local to regional, national, international, transnational, and even translocal. An advocate for immigrants marginalized by discriminatory political, linguistic, and cultural policies in their beginnings, Latino news media today serve growing communities of Latino people born in the United States and abroad, educated in English, and speaking Spanish at home.

This entry addresses first the lack of representation of Latinos in general American news media compared to the U.S. population as a whole, then looks at the evolution of Latino print and broadcast news media. The entry ends with a review of Latino news media in the digital era.

The Latino News Media Gap

According to the U.S. Census and Pew Hispanic Center reports, in 2018, Latinos accounted for 18% of the U.S. population and will make up 24% in 2065. Two-thirds were Mexicans. Puerto Ricans comprised the second group (10%), followed by Salvadorans (4%), Cubans (4%), and Dominicans (3.4%), with the remainder from Central America, South America, and Spain. Three-quarters live in the West (41%) or the South (36%), followed by the Northeast (14%) and the Midwest (9%). One-third are immigrants, nearly 80% are U.S. citizens, and 1 million enter adulthood each year. In 2017, 70% of Latinos spoke English proficiently, and a majority of English-speaking Hispanics were bilingual. In 2018, their potential spending power was estimated as \$1.5 trillion, and, for the first time in history, more Latinos than Black Americans were eligible to vote in the 2020 presidential election.

Despite their rising proportion of the U.S. population, in the early 21st century, Latinos continued to have low participation in general English-language news media, and, when becoming visible, they tended to be portrayed through stereotypes as criminals, law enforcers, cheap labor, or hypersexualized beings. In a 2014 report, the National Association of Latino Independent Producers (NALIP) addressed this media gap: As Latino consumer power grew, relative Latino media presence shrunk. Stories about Latinos constituted less than 1% of mainstream news media coverage, and the majority of these stories featured them as lawbreakers. The NALIP survey of 19 primetime shows in 2013 revealed that there were no Latino anchors or executive producers in any of the nation's top news programs, and only 1.8% of news producers were Latinos.

Diversity surveys conducted by the American Society of News Editors in 2019 and 2020 revealed that Hispanics comprised less than 7% of

the workforce in newsrooms. These studies confirmed the trend noted by previous reports produced by the National Association of Hispanic Journalists (NAHJ). In 2005, the organization found that out of an estimated 12,600 stories aired by ABC, CBS, and NBC, only 105, or 0.83%, were exclusively about Latinos or Latino-related issues, a slight increase from 2004 when Latino stories comprised 0.72% of coverage.

The lack of representation of Latinos in mainstream media and the specific information needs of bilingual audiences stimulated the creation of Latino news. The interplay among diverse variables including demographic changes, news media industry dynamics, and technological innovation led to the heterogeneous participation of Latinos and Latino media in the general American news media landscape. The first attempts were print publications, later on broadcast media, and more recently in digital platforms.

Latino Press

In its early years, print news media were led by entrepreneurs or intellectuals seeking to inform about Latino affairs. While the first Spanish-language newspaper, *El Mississipi*, was founded in 1808 in New Orleans, it was with *El Habanero*, founded in 1824, the first newspaper in the Northeast, when Latino journalism started to flourish. The Mexican territories annexed to the United States in 1848 brought dozens of Spanish-language newspapers. They reported Latino affairs, local or international, and denounced human rights violations. One prominent figure of these times was Francisco P. Ramírez, who in 1855 founded the newspaper *El Clamor Público* (The Public Outcry) as a champion of the Mexican people and an organ of resistance.

Of almost 400 Spanish-language newspapers published between the mid-19th and mid-20th centuries, more than a hundred were founded before 1900. *El Tecolote* (1875) or *La Voz de México* (1862) stand out in the Southwest. In New York, Cuban Cirilo Villaverde founded *La Verdad* (1848), and José Martí, a revolutionary journalist, poet, and independence advocate, launched *La Patria* (1892). In Tampa, Florida, newspapers such as *La Traducción-Prensa* (1901)

or *La Gaceta* (1922) were launched to serve the settlement of Cuban groups in the area.

Around 200 newspapers were launched by the time a million Mexicans crossed the border. Most of them were established in the Southwest, such as *El Heraldo de México* (1916) or *Regeneración*, started by Ricardo Flores Magón, a Mexican journalist and social reform activist. Ignacio E. Lozano founded *La Prensa* in San Antonio (1913), a weekly newspaper directed at the educated-middle class Mexicans who were living in exile. Lozano developed an editorial company and, following Mexican immigrants who settled in Los Angeles, founded *La Opinión* in 1926. As of 2020, *La Opinión* was the largest Spanish-language newspaper in the United States.

By the end of the 19th century, more than 10,000 Cubans settled in Key West, Tampa, and New Orleans. They were also attracted to New York City and joined the groups of Puerto Ricans who arrived in the United States after the annexation of the island in 1898. Hispanic, Caribbean, and Central American immigrant and exiled groups promoted cultural projects in the East Coast and launched several newspapers such as *Gráfico* (1902), founded by the Spanish José Campubrí; *El Diario de Nueva York* (1948), by Dominican Porfirio Domenici; and *Diario de las Américas* (1953), launched in Miami by Nicaraguan Horacio Aguirre.

During the Great Depression, over half a million Mexicans were deported, and journalism production fell considerably along with reduced job opportunities. Later, the establishment of the Bracero Program in 1943 stimulated a new flux of Mexican immigrants. One notable journalist of these years was Ignacio L. López, who founded *El Espectador* (1933) in California to document the life of Mexican Americans and defend their rights through his editorials, essays, and investigative reporting.

Throughout the decades, producing bilingual journalism spurred networking synergies among Hispanic journalists, college students, activists, and organizations. Several free Latino community newspapers were launched during the 1970s, including *El Tecolote*, a weekly bilingual newspaper founded in San Francisco and one of the few publications from those years still being published

in 2020. *Prensa Asociada Hispano-Americana*, formed in 1891, defended the use of Spanish language and cultural customs by Latino communities. Almost a century later, California News Media Association, founded in 1972, and the NAHJ, formed in 1984, were established to promote more participation of Latinos in newsrooms and empower the next generation of bilingual journalists. The Arizona Latino Media Association was founded in 1977 to promote diversity initiatives that deepen the scope, coverage, and understanding of Latino communities. After years of advocating for more Latinos in newsrooms, on June 6, 2020, NAHJ created Palabra, a multimedia platform by freelance members with the objective of create new opportunities for long-form journalism for and by Latinos.

While the growth of Spanish-language audiences during the second half of the 20th century increased local and regional Hispanic newspaper production, their English-language counterparts also launched publications in Spanish, though some of these publications have been short-lived. In 2019, *The New York Times* shut down its Spanish-language site (launched in 2016), BuzzFeed and Huffington Post closed their offices in Mexico, and *Hoy*, the Spanish-language publication of the *Chicago Tribune*, closed after 16 years in operation. Meanwhile, also in 2019, *The Washington Post's* new Spanish-language opinion section was inaugurated, and *USA Today* launched “Hecho en USA” or “Made in America,” a new series to tell the stories of Latino communities in both languages.

With the change of the century, some projects disappeared, while others were acquired by newly formed conglomerates. By 2012, Latino print news media ownership was concentrated in few groups: Impremedia (*El Diario-La Prensa*, *El Mensajero*, *La Opinión*, *La Prensa*, *La Raza*, and *La Vibra*); Tribune Inc. (*El Sentinel*-Orlando, *El Sentinel*-Fort Lauderdale, *Hoy Chicago*, and *Hoy Los Angeles*); McClatchy Company (*El Nuevo Herald*); The Washington Post (*El Tiempo Latino*); and El New York Daily (*La Hora Hispana*).

Although media outlets serving Spanish-speaking populations proliferated, they did not necessarily increase new local reporting capacity. In many communities, the loss of accountability

from dwindling local reporting was becoming evident. The long-term effects of the 2008 economic recession impacted bilingual print newsrooms, particularly evident in the late 2010s with the decline of advertising, the advent of digital and social media, and the sociodemographic transformation of their readership. The digital era became challenging for most bilingual news media ventures.

Latino Radio News

Spanish-language broadcasting in the United States has been closely related to the entertainment and music industries. Latinos listen to more radio than any other ethnic group. In 2017, Nielsen found that 95% of Hispanic consumers tuned into the radio in an average week. Yet it is worth noting that news/talk was the preferred format of only 7% of English-speaking Hispanics and in 2013, Arbitron found that 3.3% of Spanish-language audiences choose news/talk/information + talk/personality formats.

Many Latino music stations offered some news content, sometimes through local reporting, using the news departments of their owners, or through news service companies. News feeds have been offered by a variety of sources including Spanish Information Service, United Press International, and Radio Centro Group. In addition to accessing entertainment and getting informed, Latinos have used radio to maintain their culture since the early years. In the 1920s, San Antonio's KONO and Los Angeles's KFWB started the brokerage system that later expanded to audiences in the Southwest, South, and Northeast. By the 1940s, these broadcasts provided 264 hours of music, including some news, talk, and dramas. Between music, anchor-audience interactions, and news capsules, Latino airwaves have been building hybrid spaces for information and self-representation for a century now. One of the early examples of this trend is the work of Pedro J. Gonzalez and his program *Los Madrugadores* (The Early Risers). During the years he went on air, Gonzalez not only programmed music and entertainment but also alerted listeners to impending raids by federal authorities during a massive deportation wave in the mid-1930s. Almost a century later, Spanish-language personalities such as Los Angeles-based Eddie

Sotelo, known as *El Piolín (Tweety Bird)*, were seen as community leaders and conveyers of communal sentiments. In his radio show with an entertainment format, Sotelo included useful information about immigration, politics, and culture and promoted participation in the series of immigrant rallies throughout the United States during the spring of 2006.

Paradoxically, despite the negative political sentiment and the increase of anti-immigrant or anti-Latino public discourses during these years, some entrepreneurs found commercial opportunities during the early 20th century. It is worth noting the fluidity of the airwaves in the U.S.-Mexico border. In the 1920s, Raoul Cortez founded KCOR in San Antonio and broadcast content made its way to the United States from Mexican stations. In the 1950s, while most foreign language radio declined, Spanish-language weekly hours doubled. Around two-thirds of all foreign broadcasts were Hispanic, and by 1966, more than 300 radio stations were broadcasting in Spanish. During the 1970s and 1980s, the broker system changed into improved marketing and programming strategies.

Public and community Latino radio played an important role not only informing their audiences but also in activism against discrimination, racism, and exploitation. They were led by Spanish-language and bilingual community radio projects founded in urban but also in rural areas with majority presence of Latino workers, such as KBBF-FM, the first bilingual community radio station founded in 1973 and operated by Chicanos, KDNA-FM in Yakima, Washington, in 1979, and KSJV-FM in Fresno, California, in 1980. Several Spanish-language or bilingual projects remain serving information needs, such as *Noticiero Latino* by Radio Bilingüe, or *Enfoque Latino* in KPFK.

Spanish-language programming is still a relevant component of the American airwaves. In 2018, the Pew Research Center identified 31 stations with primarily Spanish news format in the United States. Around a third of them were located in Florida, with six in Miami-Dade County alone. As Latino radio and TV flourished in the latter half of the 20th century, they became profitable enterprises when advertisers reacted to the “Hispanic booms” documented by the U.S.

Census. The pan-ethnic labeling used by the U.S. administration became a culture-specific market niche blurring differences by homogenizing these heterogeneous groups into the “Latino media audience.” Although, in some cases, marketing campaigns would address subethnic niches such as Mexicans in Los Angeles, Cubans in Miami, or Puerto Ricans in New York.

Latino TV News

Hispanic television has undergone a profound transformation from its origins as ethnic media to its competitive niche in the general U.S. TV market today. While programming mainly entertainment, it has offered news content in various formats throughout more than 60 years. In 1955, Raúl Cortez founded KCOR-TV in San Antonio, selling it later to Emilio Nicolás and Emilio Azcárraga. They bought KMEX in Los Angeles and WXTV in New Jersey, creating the Spanish International Network (SIN). Licenses were purchased for San Antonio, Los Angeles, New York, Miami, and Fresno, California, forming the Spanish International Communications Corporation (SICC), which relied on Televisa for importing Mexican telenovelas, movies, sports, and the flagship newscast *24 Horas*.

Telemundo, a prominent producer of *telenovelas* in Puerto Rico, started growing in the U.S. mainland during the 1980s. The Federal Communications Commission forced SIN/SICC to sell the monopoly, and a partnership between Hallmark Cards and Televisa acquired the consortium, changing the name to Univision. The network began broadcasting nationwide, including *Noticiero Univisión*, and Telemundo began a national newscast produced by CNN in Atlanta: *Noticiero Telemundo CNN*. During those years, CNN, BBC, and Reuters launched 24-hour Spanish-language news services.

With the development of two national and several local, regional, and transnational Latino-oriented networks, producing Latino TV news expanded the horizons. For-profit operations relied on entertainment to attract and conserve their audiences while seeking to maintain professionalism and credibility. As Hispanic TV became a strong player within the American news media landscape, so did their anchors and reporters. In

the beginning, broadcast journalists were mainly trained in or had professional experience in Latin America.

The news media mechanism behind Latino TV became a bridge between Latinos and Latin Americans as news offerings served Spanish-language dominant immigrants interested in local, national, and domestic affairs, but also news from their countries of origin. Between the 1980s and the 1990s, news production services expanded as media conglomerates consolidated. CNN launched its Spanish-language 24-hour news channel in 1997 and, in 2011, incorporated a new slogan: *CNN, vive la noticia* (live the news). In 1995, Telemundo opened its first studio on the West Coast, later acquired by Liberty Media and Sony Pictures Entertainment. The network founded the first news division in 1999.

Between the 2000s and the 2010s, restructuring continued with the participation of domestic and Latin American investors. Azteca America launched KAZA in Los Angeles; Fox International and RCN network (Colombia) founded MundoFox; Liberman launched Estrella TV in California; Comcast acquired NBC Universal Telemundo; Univision was acquired by Broadcasting Media Partners and later on announced the launch of Fusion in a joint venture with ABC News.

In recent decades, Latino TV news media production, dissemination, and consumption became increasingly complex in terms of geographical concentration and dispersion, language usage, generational, and technical gaps. There were several attempts to create new models catering to Latinos' information needs with a wide range of results. Since 2010, English-language news organizations have tried to increase their Spanish-language offerings in a number of ways. CNN and Fox News both launched Spanish-language projects covering Latino issues on their websites. CNN Latino ended in 2014 after barely 1 year, Fox News Latino, launched in 2010, shut down in 2016. NBC Latino was launched in 2012 and lasted only a year. Fusion's premier news offering, America with Jorge Ramos, was hosted by Noticiero Univision's anchor, but this daily show was scaled back to weekly in 2014.

The concept of news diversity is often equated with providing an alternative to the mainstream narrative. But many of these TV outlets function

as other profit-oriented U.S. mainstream media, with similar corporate structures and expansion patterns, and do not always meet the expectation of alternative programming. Despite these challenges, many bilingual reporters, anchors, and editors continue to strive to offer information to the communities they serve. Over the years, new generations of bilingual journalists, some of them born in the United States, have been joining the Latino news media production arena and helping news organizations respond to ever-changing bilingual and bicultural audiences.

The Digital Era

According to Pew Research, readership of Latino print publications has been decreasing since 2011. The daily circulation for most newspapers was no larger than 35,000. Average per-paper circulation for the top 20 Hispanic weekly and semiweekly newspapers in 2018 remained above 90,000. A map produced by the Craig Newmark Graduate School of Journalism at the City University of New York (CUNY) in 2019 found 244 newspapers and 32 magazines. All print publications were independently owned with small newsrooms or no newsrooms at all. Many do not produce original content. The largest groups were Impremedia (with publications in New York, Los Angeles, Chicago, and Longwood, Florida), Mundo Hispánico (an Atlanta-based regional network of one local newspaper and several digital publications), and 22 Spanish-language newspapers owned by English-language newspaper companies. The map produced by CUNY in 2019 found hundreds of Spanish-language radio stations, but the majority with no news content at all. Only 37 radio stations offered some kind of news. Most of them were small and owned by Latino community members. Among them are HITN (New York), KBBF (California), Latino Public Radio (Rhode Island), Lexington Community Radio (Kentucky), and Radio Bilingüe (California). There are also Latino-led radio and audio productions that have been distributed nationally. *Latino USA* started in 1992 as an English-language radio show; as of October 2020, it was produced by the nonprofit Futuro Media and distributed by PRX as a public radio show and podcast. *Radio Ambulante* is a narrative podcast that covers Latin American

stories in Spanish and since 2016 has been distributed by NPR.

Latino news media keep offering news to immigrants and Spanish speakers, and to bilingual and English-dominant Latino groups. Television remains the most viewed platform among older generations, and news production is still dominated by Univision and Telemundo, followed by other outlets, such as Estrella TV and Azteca America. The growing presence of digital native Latino-oriented outlets reflects the evolving use of news media among U.S. Latinos and, more specifically, among younger generations. Recent years have seen the growth of diverse digital native bilingual projects for Hispanic millennials including Latino Rebels, Remezcla, We are Mi Tú, Flama, Pero Like, El Tímpano, El Migrante, Boyle Heights Beat, News Taco, Proyecto Pulso, Latinext, and Latino LA, to name a few of a growing number of ventures.

According to Pew Research, in 2006, the Internet was the fourth most-used source of news, behind television, radio, and newspapers; 10 years later, it became the most-used news source for Latino audiences. Behind this trend lie significant divides across generations, language use, and immigrant status among Latinos. In the post-broadcast era and with the advent of social media, Latino news production, dissemination, and consumption are transnational and bilingual. It goes beyond reporting in two languages but understanding linguistic and cultural diversity as well as innovative ways of storytelling in the digital age.

LEE, IVY LEDBETTER

Ivy Ledbetter Lee (1877–1934) was one of the fathers of professional public relations as understood in the 21st century. Promotion has been practiced since antiquity, but public relations was born in America in the late 19th or early 20th century. (Historians do not agree on the precise date of the profession's birth.) Lee is largely credited with influencing the development of the profession by setting the ethical standards and philosophical underpinnings of how practitioners ought to work. An 1898 graduate of Princeton University, he reported for three New York newspapers before he left journalism in 1903 for the

promise of public relations. At first, he worked piecemeal or freelance jobs until George Parker, formerly press agent for President Grover Cleveland, secured Lee a position with the 1904 Democratic presidential campaign. After the campaign, they established a public relations firm, Parker and Lee, in 1904. The firm adopted the slogan "Accuracy, Authenticity, and Interest."

Lee developed his philosophy further and issued a Declaration of Principles. He was concerned with the common practice of many press agents, who lied or exaggerated to promote clients, causes, and events. Those press agents were often associated with P. T. Barnum-like circus antics. Lee saw the new field as something different. His public relations philosophy and principles molded and shaped 20th-century public relations and beyond.

Lee's Declaration of Principles

Because many press agents were disreputable, Lee wanted to ensure that the public, including reporters, knew he would aspire to higher ethical standards. He sometimes failed to meet his own expectations, leading to criticism, but he pivoted from the common practice of press agency. In doing so, he took public relations with him. Most press agents of the day communicated with the public to persuade them or pique their attention, but they were not interested in hearing from the public. The communication cut in only one direction. In his Declaration of Principles, Lee established communication that traveled both ways, declaring that he would be transparent, accurate, and accessible to the press. His declaration was truly the antithesis of press agency tactics in the early 1900s. Instead of a press agent, he saw his role as that of *publicity counselor*, and Lee is considered the first of those, even though he was not the first one to use the phrase. Lee was creating philosophies that did not yet have a nomenclature.

Lee began practicing public relations in the Progressive Era (early 1900s) when muckrakers were investigating and exposing corrupt business practices of the businessmen who became known as the *robber barons*. As a former Wall Street reporter, he advised his corporate clients to open their businesses to scrutiny and invite the public to understand their operations. If their practices

were unethical, he recommended that they adopt new operating methods and then tout the changes to the world. In short, Lee would practice a type of public relations that involved transparency and facts; the profession followed his lead.

Lee and the Railroad Industry

After establishing his firm, Lee landed the Pennsylvania Railroad as a client in 1906, and he began to apply his revolutionary principles. Lee was the first to issue a press release, and Lee was one of the first practitioners to have a seat at the management table. Lee thought it was important for public relations counselors to work as managers, and the Pennsylvania Railroad afforded him that opportunity. In 1908, Lee left his public relations agency for a job with the railroads, leading to a management position in 1912.

In 1913–1914, Lee helped the Pennsylvania Railroad win a battle to increase freight rates by 5%. Lee's advocacy for the railroad demonstrated that public relations has a role in influencing public opinion and American democracy. Lee helped the railroad with a campaign directed at both the public and government officials, specifically the Interstate Commerce Commission (ICC), advocating that the railroad needed the rate increase. The ICC relented and allowed higher rates. Lee's influence in persuading government officials to side with his client was an important victory. His reputation grew, and multiple railroads hired Lee to handle their publicity.

Lee and the Rockefellers

John D. Rockefeller, Jr. was Lee's most notable client. The investigative reporter ("muckraker") Ida Tarbell exposed poor business practices of Standard Oil—owned by the Rockefellers—and the family was vilified as insensitive and corrupt. Additionally, the government ruled that Standard Oil was a monopoly and dismantled the company. As a result, the public disdained the Rockefellers. In this context, the Rockefellers hired Lee to repair its image following the Ludlow Massacre in Colorado. The Rockefellers were stockholders in Colorado Fuel & Iron Company (CF&I), which became embroiled in a dispute with workers. On April 20, 1914, coal miners were striking when

men were sent to make the strikers work again. Gunfire was exchanged, and several people were killed, including women and children. Lee managed the crisis through an outpouring of information from the coal mining company's perspective. His publicity campaign is noted for its successful tactics and for Lee's departure from his own principles.

Lee counseled coal company officials to talk to the press and distribute their side of the story through bulletins, titled "The Struggle in Colorado for Industrial Freedom." Lee's publicity machine churned out nearly 20 bulletins, distributing facts from the coal company's perspective. Critics called the veracity of the bulletins into question, and they were quick to note that Lee was peddling falsehoods. The bulletins were flawed, and Lee was operating against his stated principles. In 1915, Lee testified before a government commission that he did not verify the facts in the bulletins, but rather, he distributed what his client gave him. He was merely the conduit of the facts, not the authenticator of them. His critics suggested that distributing a client's account of the facts without first checking them fell short of the accuracy he had spoken of in the Declaration of Principles. Although he was able to help the Rockefellers and CF&I, Lee's own reputation took a hit. His tactics and strategies used in the campaign were effective, but his apparent disregard for the veracity of what he was disseminating cost him credibility.

Lee had a long-standing relationship with the Rockefellers, working with them for two decades. Lee worked on press relations, influencing the Rockefellers' coverage. Lee did this through several tactics and strategies. For instance, he encouraged and facilitated Rockefeller's accessibility to the press, persuading John D. Rockefeller, Jr. to speak with reporters and to treat them equally. Lee was able to rehabilitate the Rockefeller name through rigorous press relations.

Lee, the Red Cross, and World War I

World War I provided the burgeoning public relations profession an international platform to showcase its persuasive powers. President Woodrow Wilson (Lee's former professor at Princeton) knew he needed to sell America's participation in World

War I. To that end, he created the Committee on Public Information (CPI) and appointed George Creel, a journalist and politician from Missouri, to head it. It became known as the *Creel Committee*, and it is largely considered one of the most successful government public relations campaigns in U.S. history. Lee often engaged in public relations on behalf of corporations and captains of industry, but during World War I, he directed publicity efforts for the Red Cross. Lee overhauled the publicity program for the Red Cross, making the organization itself a part of the Allied cause. As publicity director of the Red Cross, Lee cooperated with the war communication effort of CPI to promote the humanitarian organization. When the war ended, Lee remained a volunteer with the Red Cross and provided help when the organization needed it.

Criticisms of Lee

Lee's hypocrisy regarding facts and truth during the Ludlow Massacre opened him to criticism; some of his critics even called him *Poison Ivy*. But it was not the only time controversy engulfed him. In 1927, he went to the Soviet Union and communicated what he saw. This made many people uncomfortable because American-Soviet relations were dicey during this period. He wanted the two countries to communicate with each other in order to find grounds for some semblance of peace. Additionally, Lee took on a client, the German Dye Trust, I. G. Farben. In 1934, its leaders were concerned that the National Socialist (Nazi) Party leader Adolf Hitler's recent rise to the head of government as Chancellor would negatively impact business with Americans. Lee said he never advanced Nazi propaganda, but rather, he just gave the German company some advice. Nonetheless, Lee's providing advice to the German company caused people to question his patriotism. Later, during the post-World War II trials in Nuremberg for war crimes, Lee's name was mentioned in connection with this client. Lee said he had advised I. G. Farben as he would any client; in other words, he recommended policy changes in the German government and advised that the government should then tell the people what they had done to make the country better. Even so, many people criticized him for having

had anything to do with Germany at this time in history. Lee's international public relations activities hurt him, and he had to testify before the House Committee on Un-American Activities in 1934. Lee was cleared by the government, but his reputation was damaged. He died of a brain tumor later that year.

A Question of Paternity

Many consider Ivy Ledbetter Lee to be the father of modern public relations, but another public relations pioneer, Edward Bernays (1891–1995), offered a rival claim to that distinction. Bernays had promoted the profession, and he had a strong influence over its acceptance. Indeed, the profession is so rich and broad that undoubtedly more than one person helped to found it. In any case, Lee was surely among the pioneers; his bona fides have been described above in terms of his groundbreaking philosophy and techniques. In addition to Parker and Lee, he also founded the public relations firms, Ivy L. & Associates, and Lee, Harris, and Lee. His list of clients included a veritable who's who among American corporations, and he innovated many public relations strategies and tactics. On a macro level, he persuaded industrialists previously viewed as robber barons to change the way they conducted business—he got them to open their doors and explain their operations to the public. Lee sometimes fell short of his own standards, but he transformed a profession, and in the process, he influenced the history of the United States and many of its institutions.

LETTERS TO THE EDITOR

For centuries, the dominant form of audience feedback has been the "letter to the editor," or LTE, and examples of LTEs can be found as early as the newsbooks of the mid-17th century. The standard form is that of a personal opinion or observation that is intended for publication—thus, an LTE is an "open letter" to the reading public rather than a private note to a publication's editor. The LTE format was so common in print newspapers and magazines by the 20th century that the form was adapted to electronic media, such as call-in radio shows, "talkback" features on TV news shows, and online comment forums (including social media feeds) tied to digital

media. This entry discusses LTEs dating back to the 1600s, the formalization of newspapers' LTE practices, journalists' attitudes toward LTEs, and academic research on LTEs.

Early LTEs

The earliest examples of LTEs can be found in European newsbooks published in the mid-1600s, and for some of those newsbooks, LTEs were a primary form of content (a notable example was a London-based newsbook from the 1640s titled *Packets of Letters*). As that was an era of widespread censorship and enforcement of criminal libel, most LTEs of the era were "signed" with pseudonyms or the writers' initials. Although a primary goal of such quasi-anonymity was to evade retribution for espousing antigovernment opinions, it also served an Enlightenment-era custom for opinions to be judged on their own merits, irrespective of attitudes toward the author. By the mid-1700s, the publication of "anonymous" LTEs was widespread among newspapers in Europe and European colonies, with signatures such as "A Citizen" or "A Farmer" quite common.

Some of the most influential anticensorship and pro-democracy essays of the 18th century were published in the form of pseudonymous LTEs: "Cato's letters" in the *London Journal*, "Letters from a Farmer in Pennsylvania" in newspapers of colonial America, and the "Federalist Papers," a series of essays written to promote the ratification of the U.S. Constitution written by "Publius." The identities of those writers were not revealed until years later, sometimes posthumously (e.g., "Cato" was only revealed as a collaboration by Thomas Gordon and John Trenchard after Trenchard's death, and the collaborators behind the Federalist Papers' "Publius"—James Madison, Alexander Hamilton, and John Jay—were not revealed until after Hamilton's death).

The publication of LTEs is inextricably tied to the concept of "freedom of the press" and not just because arguments against censorship were published as LTEs. The famous 1735 libel trial against New York printer John Peter Zenger originated with the publication of essays formatted as LTEs in *The New York Weekly Journal* that were critical of colonial governor William Cosby. Cosby used antilibel laws to attempt to force Zenger to reveal

the identity of the anonymous writers; the case resulted in a number of legal precedents in favor of a free press, including the rights of editors to publish opinions (including anonymous LTEs) that are critical of government officials. A similar case in England later that century—the trial of the editor of *The Public Advertiser* for publication of the "Letters of Junius"—resulted in a verdict of "guilty of printing and publishing only," which was essentially an acquittal.

Although many LTEs published in the 1700s were written by common people focused on more mundane local topics, it was not until the mid-19th century that LTE forums became more akin to the idealized "voice of the people." A notable example was in the *New York Herald*, in which editor James Gordon Bennett created a special space for LTEs titled "Our Complaint Book," which required signed letters that were often printed with rejoinders from Bennett (some historians also suggest that Bennett would sometimes publish letters of praise that he, himself, had written under various pseudonyms). By the early 20th century, many newspapers also created stand-alone sections for LTEs (in 1908, *The Chicago Tribune* launched its section, "The Voice of the People," and in 1931, *The New York Times* launched its section titled, simply, "Letters to the Editor"). Since then, it has become common practice for news media to group LTEs into a single section within a newspaper (usually in the opinion section) or a print magazine (usually in the front section). Digital publications generally provide specific sections for LTEs and other forms of audience feedback.

Formalization of LTE Practices

The formal packaging of LTEs in the early 20th century coincided with the professionalization of journalism, and the latter led to a gradual erosion of the more egalitarian aspects of earlier LTEs. In the United States, the 1947 report of the Commission on Freedom of the Press, also known as *the Hutchins Commission*, called for news media to renew their commitment to providing space for people to share opinions and ideas. Many news professionals editorialized against the ideas in the Hutchins Commission report, but the social responsibility model of professional ethics

eventually influenced many news outlets to expand their accountability practices, including more attention to LTEs. Editorial practices involving LTEs became much more formalized by the mid-20th century. LTEs by then were considered a part of a publication's "accountability" portfolio, which also included publication of longer op-ed essays, editor's columns, ombudsman/"public editor" positions, and direct communications between editors and audience members.

By the late 20th century, the practice of soliciting, selecting, and editing LTEs was considered a primary task of editorial-page editors at larger publications (some even hired dedicated "letters-to-the-editor editors"); at small publications with small staffs, the task was usually handled by the top editor or editor/publishers. Specific protocols varied from publication to publication, but common were "must sign" requirements, length limits (commonly 250 words or fewer), limited frequency for "regulars" (typically only one LTE per month), prohibitions on personal attacks or potentially libelous claims, and taboo topics or forms ("no poetry," "no commercial pitches," "no religious proselytizing"). Some publications were more libertarian and would publish letters on any topic; others were more restrictive and would only publish letters responding to articles or opinion essays published in earlier editions. Many editors were also on guard against organized LTE campaigns in which people would sign their names to prewritten letters developed by advocacy groups and political campaigns, a practice derided as "astroturf" (or "fake grassroots").

Many newspapers and magazines received more LTEs than they could fit into the confines of devoted sections, and selection criteria were instituted that privileged letters based on the quality of writing and the sophistication of the opinions expressed. Large-circulation newspapers often would publish only a dozen or so LTEs from the scores or hundreds of daily submissions, while the more numerous community newspapers would publish almost every acceptable letter received. In the magazine sector, the practice was to only publish letters responding to content in the previous issue, making magazine LTE sections essentially fan mail forums.

Attitudes Toward LTEs

Scholarly studies of the demographics of published letter writers have found an editorial bias toward LTEs from the educated middle class. Meanwhile, editors began to more routinely reject (and eventually discard automatically) LTEs that did not bear the names of the writers, which created a chilling effect for participation from would-be writers from vulnerable populations. Many journalists also developed a cultural disdain toward those who submitted anonymous/pseudonymous LTEs, and many journalists considered LTE writers in general to be eccentrics, fanatics, or crackpots (what media scholar Karin Wahl-Jorgensen dubbed "the idiom of insanity").

The onset and eventual dominance of electronic media through the 20th century resulted in a number of adaptations and innovations concerning LTEs. Radio and, later, television news programs would sometimes read from letters sent to their stations, such as the "World Have Your Say" segments on BBC *NewsHour*, "Listener's Letters" on Australia's *By Design* radio show, and "letters from viewers" segment on the CBS news magazine *60 Minutes*. Telephone voicemail technology also allowed some newspapers to develop anonymous call-in versions of LTEs, often packaged separately from LTEs. In general, the items in the anonymous call-in lines were more egalitarian and less sophisticated than signed LTEs. A number of industry leaders and academics denounced such forums as unethical and coarse, but proponents noted that the forums were popular and provided a channel for expression to citizens who were essentially locked out of LTE forums by the rigorous gate-keeping procedures adopted earlier in the century. Scholarly studies of the features found that the topics discussed in the anonymous call-in forums were substantively different and more locally focused than those discussed in LTE forums, and thus expanded the "forum function" of local newspapers in meaningful ways.

In the early 21st century, the shift to digital publishing resulted in another adaptation of LTEs—the online discussion forum. As with the anonymous call-in forums of the later 20th century, online discussion forums were a source of professional disagreement, as proponents heralded the expansion of public discourse via those

forums and critics denounced the coarseness of online rhetoric (often conflating that coarseness with anonymity). Some news organizations shut down their online forums out of frustration with coarse rhetoric and a lack of personal accountability; many simply shifted the discussions onto social media channels as a way to distance the news outlet from the rhetorical free-for-all of online discourse. A few news outlets shifted to moderated online forums, using automated technology, user-flagging tools, and staff moderators to screen and block inappropriate posts. As online discussion forums expanded in popularity, participation in more traditional LTEs declined at many newspapers and magazines, although the forums continued to draw some submissions.

Research on LTEs

As a topic of scholarly research, LTEs have received some attention. Major histories of the press rarely mention LTEs, if at all, although there are several peer-reviewed journal articles that use LTEs to analyze historical moments or social movements of the past. There have been a few edited volumes of compiled LTEs, such as a series of collections of letters to *The Times* of London and a compilation of LTEs published in Soviet Union newspapers during the perestroika period. An interesting use of LTEs as source material was a stage play by the Bloomsburg Theatre Ensemble in central Pennsylvania, which used scores of LTEs from across two centuries to construct a historical overview of Bloomsburg and neighboring towns. Mostly, LTE studies have been in the form of research articles, conference papers, and practical essays.

A handful of studies from the late 20th century tried to determine the demographics of LTE writers, but were limited by only contacting the authors of published letters (and thus could not discern the demographics of LTE writers whose letters were not published). Some ethnographic studies have provided insights into the professional practices and attitudes of journalists toward LTEs and their writers. Professional organizations would occasionally conduct workshops or publish practical essays about LTE issues (*The Masthead*, which was published by the National Conference of Editorial Writers, had a few special issues in the

1950s and 1960s devoted to LTE management). Some studies compared the content of published LTEs against public opinion surveys and found little correlation—perhaps due to the subjective selection practices of editors. A significant number of theses and dissertations have analyzed LTEs to better understand social movements and minority subcultures, from environmental activists to feminists to the Amish. Even as scholars focus much more attention on digital forums, especially social media networks, the role of LTEs in society remains a rich source of historical and contemporary data about “the voice of the people.”

LGBTQ ISSUES, COVERAGE OF

Coverage of issues related to lesbian, gay, bisexual, transgender-identified, and queer (LGBTQ) individuals has a very mixed history, both in terms

of the amount of coverage and tone. This entry provides a brief examination of journalistic coverage of LGBTQ people and issues in the United States and points out the roles played by both mainstream and alternative journalistic sources in this reporting.

The basic trajectory of the coverage of LGBTQ people and issues can be best understood by examining key moments in LGBTQ history as lenses through which to view journalism's interest in the subject. Eight defining eras in LGBTQ news coverage can be broadly described in the following ways: indifference/sensationalism, stigmatization, the movement toward rights, pride, AIDS backlash, the inclusion of bisexuals and transgender individuals, the gaining of rights, and the monetization and commodification of LGBTQ culture. Each of these terms is explained in the following sections of this entry. Major changes can be seen in both the content of stories and the importance that news organizations placed on covering the community through these different eras, and each helps us understand public opinion of LGBTQ people, as well as the media's role in helping or hindering the community's social and political progress.

The abbreviation LGBTQ came about through its use by several major activist groups in the late 1990s. The concern of these organizations was that the then-common use of *gay* as an umbrella term had lost its usefulness for describing a very diverse community, and that a new term was needed that represented a more fluid understanding of sexuality. While the first four letters in the abbreviation are self-explanatory, the "Q" is a more recent addition, one that has two possible meanings. The most associated meaning is "queer," representing the reclaiming of a once offensive and pejorative term used to deride anyone who deviated from heteronormative sexuality. It is a broad term, in that anyone identifying as lesbian, gay, bisexual, or transgender can also claim it. Many in the community see the reappropriation of the term as an expression of power. The second meaning associated with the "Q"—though not used as broadly—is *questioning*, a term some activists say shows the inclusivity of the community as a safe space for those whose sexual identity is still forming.

Indifference/Sensationalism

For much of history, homosexuality was not considered a defining feature of one's life—not even of one's sexuality. Some societies endorsed it, some tolerated it, and many considered it as simply a variation of human sexuality. The word *homosexuality* was not even used before the 19th century when psychologists adopted a medicalization of deviance approach to studying what was considered aberrant behavior. This authority provided by psychologists and social scientists provided legitimacy to the tenor of most news coverage.

While late 19th- and early 20th-century newspaper and magazine coverage of any issue related to homosexuality was practically nonexistent, editors did make the exception for sensational reporting of events. The obscenity trials of Oscar Wilde, and the controversial research on sexual "inverts" from scholars such as Havelock Ellis and Magnus Hirschfeld, whose writings were among the first to describe homosexuality as a normal variation of human sexuality, did attract press attention. Aside from the sensational and the provocative, stories about homosexuals simply did not exist. Long considered unspeakable in polite society, newspapers and magazines remained loath to consider the community and its concerns newsworthy.

This era also represented a change in approach to covering stories by newspapers, many viewing their roles as defenders of the public interest, especially on issues concerning morality. Exposés and investigative reporting began to appear in the nation's metropolitan newspapers and magazines. They most often described homosexuals as deviants, morally corrupt and needing to be controlled. They embraced stereotypes and used terms such as *unnatural*, *sinful*, and *diseased* in their descriptions of homosexuals and their place in society. It was very clear from mainstream coverage that the journalistic establishment saw its role as one of protecting wholesome society from the homosexual.

Any positive portrayals of gay life were found in the often poorly funded and narrowly distributed newsletters written by gays for a gay audience. Some exceptions, reaching relatively large readerships, did exist. *One Magazine*, targeted primarily to gay men, and the defendant in a

government lawsuit aimed at stopping its publication on grounds of obscenity, and *The Ladder*, its counterpart marketed to lesbians, appeared in the early 1950s and were the first publications to reach a national audience, albeit covered in an unmarked wrapper. Their content, while groundbreaking for the time, more often than not resembled the publication's packaging—a keen awareness of the homosexual's place in broader society. Their call was for toleration and assimilation, not liberation.

Stigmatization

The paternalistic attitude of the mainstream press continued throughout the mid-20th century in the United States. Coverage by news organizations often took the form of lurid stories that gave readers a purported insider's view of gay bars and other hangouts. Reporters often cooperated with law enforcement in undercover sting operations and mass arrests. Advice columns, usually citing medical professionals to provide authority, appeared in general interest magazines with instructions on how to spot the homosexual in public, and in cautionary tales warning parents of the early signs of homosexuality, and what they should do to stop it in their children. News organizations gave credibility to doctors promoting "cures" for sexual deviance. News coverage, on the whole, was not to promote an understanding or even tolerance of homosexuality, but to warn the public of its presence and its dangers.

The Movement Toward Rights

Even news organizations known for their progressive editorial stances and strong reporting on the civil rights movement were not ready or willing to extend the same considerations to the nascent beginnings of a gay and lesbian rights movement that coincided with the 1969 Stonewall Inn uprising in New York City. Even in covering the event—the first time that the patrons of a gay bar fought back against a police raid—newspapers clung to their stereotypical descriptions of the protesters' clothing and mannerisms, even mocking their resistance with language that questioned their ability to fight back as "real" men would. Homophobic attitudes were widespread in the

male-dominated media world of the time, with some publishers even giving direct orders to limit any positive coverage of the community.

Pride

The 1970s represented a time of steady and significant political and social growth for the gay community. While slow to develop, mainstream news coverage of gay life and issues began to increase as well. On June 28, 1970, the world's first Gay Pride event—then called the *Christopher Street Liberation Day March*—was held in New York to commemorate the 1-year anniversary of the Stonewall rebellion. And while relegated to the bottom right corner, it was still front-page news in the following day's *The New York Times*. Gone was the name-calling and reliance upon stereotypes to describe the marchers. And while condescending descriptions of the community and its causes has never fully disappeared from news coverage, the nation's newspaper of record managed that day to humanize the marchers, providing serious coverage of their demands for justice.

In 1973, members of the American Psychiatric Association voted to remove homosexuality from its diagnostic manual as a mental illness. As would be expected, news organizations gave considerable coverage to the decision, but in an apparent nod to objectivity, gave significant space and airtime to those who opposed the decision. One article quoted a dissenting psychiatrist who compared homosexuality with diseases like polio.

Press attention to the gay and lesbian community continued to increase throughout the decade, with much of it dealing with the increased political strength that the community had obtained in some of the nation's major metropolitan areas. Mainstream press attention to issues important to the community was, in large measure, the result of lesbians and gay men—some out, some not—working in the nation's newsrooms and pushing their organizations to provide more stories on the community. Often, these journalists had made contacts with gay and lesbian political leaders, both professionally and personally, who not only fed them story ideas, but who advocated for their coverage. While some publishers and news directors did not grasp the importance of covering gay and lesbian issues, others simply did not see them

as a major part of their audience, or not of large concern to it. The leaders of some news organizations even appeared hostile to stylistic changes, such as replacing the term *homosexual* (long eschewed by community leaders as being too clinical and stigmatized) with the more popular *gay*. *The New York Times* resisted using the word *gay* until 1987, and it took the Associated Press until 2006 to change its stylebook to restrict the use of the word *homosexual*.

If the mainstream media were still hesitant to acknowledge the massive political and cultural changes occurring in gay and lesbian life during the 1970s, alternative publications, mostly gay owned, were eager to fill the void for their audiences. Magazines and newspapers that began in the late 1960s were coming into their own and oftentimes scooping the major press with stories on the community. Publications such as *The Advocate*, a national publication, and metropolitan newspapers such as Chicago's *Gay Life*, and the *Washington Blade*, serving the National Capital Region, grew both their readership and influence. Their content was political, and unlike earlier publications, they called for gay rights, not mainstream tolerance.

AIDS Backlash

From the moment that *The New York Times* ran its 1981 story of a new and fatal disease affecting mostly gay men, the association between AIDS and homosexual behavior was indelibly imprinted on the public consciousness. Before the medical community settled on the HIV/AIDS label for the virus and its related diseases, early newspaper accounts referred to it as *G.R.I.D.*, standing for gay-related immune deficiency. Some mainstream news organizations even used the words *gay cancer* and *gay plague* in describing a disease that also was contracted by heterosexuals, including but not limited to IV-drug users and blood transfusion recipients.

In the decade following Stonewall, social and political progress of lesbians and gay men was slow but steady, helped along with the decision of the American Psychiatric Association to change its diagnostic manual, the passing of state laws and city ordinances that for the first time provided a semblance of protection for their gay citizens, and even the first openly gay elected officials.

Large-scale polls began to indicate less overall hostility toward the gay and lesbian community, as well as more support for their basic civil rights.

Some conservatives and members of the "religious right" who had long opposed any legal recognition for gays and lesbians used the media-perpetuated association of the community with AIDS to create a backlash against hard-fought for rights. Some—including well-known figures—publicly called AIDS the *perfect* disease because of the kinds of people it was targeting. AIDS hysteria became a prominent theme of news and television coverage, and the voices of former allies of the community fell silent. Ronald Reagan, who became U.S. president in 1981, first mentioned the word AIDS publicly in 1985, 4 years after its first mention in the press. By then, known deaths in the United States from AIDS neared 6,000. News coverage began to follow public opinion polls showing a reversal in public opinion on gay rights, and the public's growing perception of AIDS as a gay problem. More stories on crimes against gays, the so-called "gay bashings" appeared. More than one network news organization ran stories explicitly about the decline in gay cultural clout.

"B" and "T" Join the Alliance

The term *LGBT* was being used as early as the 1990s in the United States, promoted by activists who wanted to avoid the limitations embodied by the binary terms *gay* and *lesbian*, limitations that they saw as being as problematic as the male/female definitions of gender in a heteronormative understanding of human sexuality. It was not until the mid-1990s that gay pride parade organizers in San Francisco decided to include bisexual and transgender as part of the official event title. That same year, *The New York Times* published an article that explained to its readers the rationale, as well as the fraught history of the addition of the additional monikers.

While bisexuals were known to have been at Stonewall and other major events for the LGBT community, their presence was not particularly noted by either the mainstream press—or by gays and lesbians. Generations of bisexual women and men never found full acceptance within the gay and lesbian movement. When AIDS struck, mainstream news organizations painted bisexuals as

the most dangerous of individuals, easily capable of spreading the “gay” disease into the heterosexual population. A *Time* magazine cover story at the time referred to bisexuals as the *true pariahs* of the AIDS crisis. Even today, stories about LGBT victories or tragedies rarely make any special note of bisexuals, or of their role in the community.

Transgender is a term used to identify people whose gender identities are different from what they were assigned at birth. The Associated Press Stylebook, *The New York Times*, and Reuters have all in the past few years added guidelines on how to properly identify transgender individuals. The concern that these news organizations now show is far removed from the time when the press would lump anyone whose dress or behavior was out of line with the normative expectations of their gender, as transvestites. This term was used in both pejorative and obviously inaccurate ways.

When drug “cocktails” were developed in the mid-1990s, and as HIV/AIDS became considered more of a chronic illness, rather than a death sentence, news coverage slowed. Even while the illness continued to kill hundreds of thousands around the world—particularly in poorer countries and on the African continent—the attention of U.S. media to the LGBT community changed direction.

A Seismic Shift

The past decade has presented itself as nothing short of a transformation in terms of public opinion about, and media coverage of, the LGBT community’s presence within the life of this, and many other nations. Activists—many involved in civil rights activities on behalf of other marginalized groups—have referred to the pace of LGBT progress over this time as stunning in its speed and far-reaching impact. From the 2015 U.S. Supreme Court decision in *Obergefell v. Hodges*, which confirmed same-sex marriage as a Constitutional right, journalists have documented legal victories and cultural triumphs for the LGBT community. While there have been moments of backlash both in the United States and abroad, mostly fueled by political rhetoric, and of which journalists have covered, the 21st-century news story of LGBT people and communities has been one of unimaginable progress.

Monetized Marginalization

While the news stories of LGBT progress have been welcomed by most all members of the community, some have pointed out the losses that have accompanied the cultural mainstreaming of LGBT people. The loss of “gay culture,” including traditional meeting places and specialized publications, has been lamented by some members of the community. The rise of “gay chic” and its open discussion in mainstream news stories, as well as in hyper-targeted advertisements to a once-ignored market, have all been issues covered by the mainstream press. Some members of the community believe that mainstream media, especially advertising, have taken new and enthusiastic interest in them because they see them as consumers. Some argue that “straight” media have appropriated authentic LGBT culture for its monetary value. Stories have appeared in both the mainstream and alternative presses about the potential loss of LGBT history and have even discussed whether being mainstreamed—such as in the legalization of same-sex marriage—serves to assimilate LGBT people at the cost of a unique and important culture.

LGBTQ JOURNALISM

For many individuals who identify as lesbian, gay, bisexual, transgender, or queer, the mainstream news media have historically been viewed with distrust and a belief that interest in their lives fell well beyond the concern of most reporters and editors. This perception was not without grounding. Until the late 20th century, news coverage was often restricted to sensationalized stories focused on salacious details about marginalized lives and illegal sexual behavior. News workers, for many years, were actively discouraged from reporting on the LGBTQ community apart from the occasional crime story, and in many cases, they were outright forbidden to provide coverage that would lend any sense of legitimacy to the community.

While still strained, the relationship between news organizations and members of the LGBTQ community has evolved along with changing legal and cultural standards. In many instances, an increase in coverage has followed major events, such as the decriminalization of gay sex and the later recognition of same-sex marriage. In others, journalists and their organizations have been on the front lines, working to advance the interests of LGBTQ-identified people through more nuanced and affirmative coverage. When they did fail by ignoring, misrepresenting, or falling behind the curve of LGBTQ progress, the alternative gay press has stepped in to provide an important service to the community, as well as driving increased attention by the mainstream press.

This entry examines the history of LGBTQ journalism, debates and controversies about LGBTQ journalism, and its evolution from self-funded and community-based endeavors to its integration into mainstream and for-profit publishing venues.

The Beginnings of the Gay Press

It was from a dearth of serious reporting—along with the societal and cultural changes brought

about by World War II—that the early gay press was born. The war, which brought thousands of people together in large cities to either train for military service or work for industries serving the war effort, meant that gay men and lesbians suddenly found that they were not alone in the world. Communities—often secretive—began to form, along with the need for a way to communicate and connect their members.

The first recorded attempt at a gay publication came in 1947 with the production of a handful of copies of *Vice Versa*, whose title was a play on words of the then “crime” of homosexuality, and the publisher’s recognition that the newsletter was intended strictly for people who went against society’s expectations. Its creator both handed out the newsletter and recruited writers for it, at known lesbian hangouts in Los Angeles. Resembling what some scholars of LGBTQ history have described as more of a college term paper than a magazine, it contained far more fiction, personal short stories, letters to the editor, and information about community events than anything resembling hard news. Its publisher insisted that it contain no vulgarity or sexualized content in order to protect it from obscenity charges by the U.S. Postal Service and to protect its contributors from the city’s vice laws that forbade any forum promoting homosexuality. *Vice Versa* only published nine issues, but it served as an important bridge to the sleeker, more daring gay and lesbian journalism that appeared in the 1950s and beyond.

An Argument Over Direction

The 1950s saw the establishment of draconian laws passed at all levels of government aimed at obliterating the public presence of anyone or any establishment seen as contrary to American values. While the decade is probably most famous for its “Red Scare” attack on anyone suspected of communist leanings, homosexuals fared no better. The administration of President Dwight Eisenhower moved to purge all known or suspected homosexuals from all government and military service. Simply serving a drink to a known homosexual was enough in many states for a bar to lose its liquor license, and for the patron to be arrested. Congregating with other homosexuals—even in private homes—often resulted in raids by vice

police. Yet, it was in this most hostile of environments that gay and lesbian journalists—many of whom who had worked in mainstream news—founded some of the most important early publications for the community.

One, a publication targeted to gay men, and *The Ladder*, its equivalent for a lesbian audience, symbolized the new direction that 1950s gay journalism would take: more hard news about the community, bolder editorials pushing for acceptance and assimilation, the use of more sexualized (though not pornographic) images to draw in readers, and the push for nationwide distribution. *One* was started by members of the Mattachine Society, one of the earliest gay and lesbian rights groups in the United States. Some members deemed the publication too political and too reactionary, and 2 years later published their own magazine, the more conservative *Mattachine Review*. Its articles and opinion pieces focused on being tolerated by society and placed much of the responsibility for doing so on its readers, advising them to behave and dress in a manner more fitting with mainstream—read heterosexual—culture.

One and *The Ladder*, however, often pushed the limits of 1950s' propriety, particularly in their calls for equality over mere tolerance. All three publications became regular targets of FBI and local law enforcement attention. While these publications gave lesbian and gay subscribers the opportunity to read about topics related to their lives, topics never discussed in the mainstream press, disagreements among their editorial staffs over just how explicit or "radical" their content should be had two major repercussions. First, they ensured that the three publications would not survive the political and societal upheavals of the coming decade. Second, the winners of the editorial arguments became well positioned to lead a new generation of publications that would be in keeping with the civil rights demands and cultural changes that were to become the hallmark of the 1960s.

News and Advocacy With a Side of Titillation

While *One*, and the *Mattachine Review* continued publishing until 1967, and *The Ladder* until 1970, new, glossier, and more bold publications

made their debut throughout the decade. Gay and lesbian periodicals of the 1960s distinguished themselves from earlier publications by their willingness to be more political (especially concerning equal rights), and more concerned with covering events by the community, such as the protests and picketing that occurred in front of government buildings (including the White House), as hard news worthy of reporting. Publications with names like *Drum*, *Vector*, and the *Homosexual Citizen* emerged during this time, their editors and reporters calling what they were doing "advocacy journalism." While distributed nationally, these were city-centered publications, which made advertising revenue possible from the local bars and clubs. Many, including New York City's GAY, never shied away from including some "beefcake" photos of naked or near-naked men to draw in the reader, hoping that they would stay for the articles.

Though there were many attempts to gain rights, or at least toleration, by early lesbian and gay leaders, it was the 1969 Stonewall Uprising that is seen by many LGBTQ historians as the beginning of the modern gay rights movement. The Stonewall Inn (now a National Monument, the first ever dedicated to LGBTQ rights and history) was at the time a small bar in New York's Greenwich Village known for its lively dance floor and drag shows. It was also known among its clientele for the regular raids that the NYPD vice squad would make, often arresting the same people over and over again. The bar made national news when in the early morning of June 28, the bar's patrons began to fight back. Coverage by the mainstream press, notably *The New York Times* and CBS News, was filled with stereotypical, homophobic, and stigmatizing language. The tenor of the coverage was light-hearted and included demeaning jokes, even though police officers were injured and many bar patrons were hospitalized.

In the aftermath of the uprising, some publications, including New York's *Come Out!* demanded of their readers a revolutionary fervor—as well as direct action—in securing legal rights for gay and lesbian people. The editors and reporters were unapologetically radical, not only discarding the norms of objective journalism but also calling for the total dismantling of heteronormative cultural

and political institutions—even advocating for the overthrow of the U.S. government.

A New Type of Journalism for a New Type of Community

The 1970s saw the proliferation of newspapers and magazines targeting the lesbian and gay reader. With names like *Gay Flames*, *Gay Liberator*, and *Killer Dyke*, some of the new journalism reflected what their editors saw as their natural place in the footsteps of the civil rights and anti-Vietnam War activities of the preceding decade. They were unapologetic in their embrace of systemic cultural change and for making the type of demands associated with the earlier movements. In what might appear the opposite approach to the often radical stances taken by some of these publications, the decade also saw the growth—and rebranding—of *The Los Angeles Advocate* into *The Advocate*, arguably the most prominent magazine targeted to gay men and lesbians—and by far the largest. By the end of the decade, it had a biweekly circulation of nearly 100,000 and was available in mainstream bookstores and magazine stands. *The Advocate* represented the first true national newsmagazine for the lesbian and gay community, departing from most other lesbian and gay publications, and their often-exclusive concentration on matters of community advocacy, political activism, or sexuality. *The Advocate* offered it all, becoming to its readers the gay *Time* or *Newsweek*. While not alone, *The Advocate* was preeminent among magazines for the lesbian and gay reader to adopt the principles and norms of professional journalism. Serious coverage of wide-ranging topics became the focus of the magazine's coverage. Even an adherence to objectivity—a hard sell to a readership used to being ignored or vilified by most media—resulted in serious reporting, some of it even picked up by the mainstream press.

A “Shared” Tragedy

The professional standards put in place at *The Advocate* and other publications for gay and lesbian readers were perfectly timed for the arrival of the most important story since the push for gay

rights hit the front pages—AIDS. While the first mainstream coverage of what would become the AIDS epidemic appeared in a 1981 article in *The New York Times* titled “Rare Cancer Seen in 41 Homosexuals,” the first article to report on cases appeared several months earlier in the gay publication, *The New York Native*. While news coverage of the AIDS crisis developed along with the numbers of infections, much mainstream media coverage focused on it being a “gay” illness, filling the papers and TV coverage with stories that stigmatized and judged gay sexual behavior, as well as intravenous drug users, sometimes conflating the two. For opponents of the achievements of the gay community over the previous decades, this news coverage provided the perfect ammunition. Some called it the *perfect* disease, one that was killing society's undesirables—homosexuals and drug addicts. And while mainstream media might not have reverted to the overt demonization of gay people seen in previous decades, their coverage impacted both public opinion and public policy in ways often detrimental to the gay community. Fears that AIDS could be transmitted through mosquito bites or toilet seats made their way into news accounts, and calls for quarantining those with AIDS, banning positive children from schools, and even tattooing people with AIDS so that they could be identified made their way into public consciousness and discussion. Though most mainstream reporting was far more responsible as a whole, it was often the gay press that led the way in covering the virus and its impact on gay life and culture. One magazine in particular, *POZ*, which launched in 1994, was targeted specifically to the HIV-positive and AIDS community. With its mixture of hard news, features, and lifestyle stories, it was regarded by many in the community as one of the most important sources of information during the height of the crisis.

From Marginalized to Monetized

The 2000s and beyond have seen a proliferation of media that are hypertargeted to segments of the LGBTQ market—*Curve* and *LMag* for lesbians, *Original Plumbing* for the trans male community, *Bi Community News* for bisexuals—all following the economic strategies of mainstream media by

providing specialized content and on-demand access. Major mainstream news organizations, including *The New York Times*, CNN, MSNBC, and the *Los Angeles Times*, now assign regular beat reporters for LGBTQ issues, many covered by out members of the community. While much of early 21st-century coverage has been positive and far less stigmatized than previous reporting, the reason may be as much because of the discovered monetary value of reaching LGBTQ-identified people as in genuine social progress or changes in journalistic norms. And while major social change, such as the legalization of same-sex marriage and the inclusion of LGBTQ characters and storylines in mainstream entertainment, has certainly driven much recent journalistic coverage, the journalism of the future is perhaps as dependent on the ability to make profits by covering the community as from any sense of journalistic responsibility. Inherent in this concern is that LGBTQ-identified people may once again be viewed as one dimensional, only this time not as sexual deviants or threats to the social order, but as an untapped source of income.

LIBEL

Libel is a legal term for a published statement that is false and harms the reputation of its subject. Such statements that are spoken, not published, are called *slander*. In legal parlance, the term *defamation* is used interchangeably with libel and slander. American law generally treats libel and slander the same, though libel has traditionally been considered more harmful than slander, because printed matter can travel farther and last longer than spoken words.

Knowledge of libel law is key to understanding the role of journalism and public commentary in a democratic society. Not only are libel suits among the most common legal threats journalists and commentators encounter, libel law is the central legal mechanism by which societies regulate the bounds of permissible criticism in the public sphere. Libel law is subject to evolving social and cultural norms and is impacted by the use of new communication technology, therefore it reflects the complexities of these dynamics. Landmark American libel cases have been a wellspring of fundamental First Amendment principles and doctrine. This entry discusses the development of libel law in the United States, the elements of libel, defenses against libel claims, damages awarded when a plaintiff wins a libel suit, and issues in libel law that have arisen as a result of digital media.

Development

Libel is an ancient concept, tied to basic elements of society like public communication, reputation, and community standing. Defamation was a punishable crime under Roman law and was considered a sin by the Christian church. Libel law was partly developed as a civilized alternative to violence—like duels—for people seeking to avenge an injury to their honor. English law was especially concerned with seditious libel—publications that threatened government sovereignty or power. Such pernicious printed matter could come in the form of criticism of the government, its laws, or its leaders, so criminal prosecutions and civil lawsuits were used to limit libel and its presumptive “bad

tendency” to sow dissent and discord among common people.

Libel law in the United States developed out of English common law principles of the colonial era, but the Americans also deviated in key ways. Perhaps the most important split was colonists’ insistence that the truth of a statement should be a defense in a libel suit. Traditionally, because a libelous statement was presumed to undermine public order—particularly in the context of criticizing official authority—its truthfulness was considered irrelevant, if not an exacerbating factor. “The greater the truth, the greater the libel,” was a common understanding of the legal standard, under which a judge determined whether a statement was libelous before submitting the case to a jury to decide simply whether the accused was responsible for its publication. But libertarian minded colonists, most notably in the 1735 acquittal of John Peter Zenger for seditious libel, argued that whether a statement was true or not, and therefore libelous or not, was a factual question for a jury to consider, especially in cases of political criticism. Subsequently, in the early republic, courts recognized a narrow privilege for truth plus “good motives and justifiable ends,” which could include commentary about the official conduct of elected leaders, based in the democratic value of a well-informed public. However, lawmakers were reluctant to altogether abandon prosecution for criticizing the government, and laws against sedition were enacted, selectively enforced, and retracted off and on amid national security crises from the late 1700s to the 1940s.

American libel law has mostly developed through civil law, wherein individuals sue publishers claiming damages for false and harmful statements. Throughout most of the 19th century, libel doctrine was rooted in protecting the political and commercial reputations of society’s “best men” from harm, with narrow exceptions for truthful or otherwise justified publications. Near the turn of the 20th century, a more pervasive and intrusive news media and an urbanizing and socially mobile public that was increasingly concerned with personal reputation prompted more libel suits involving a broader range of classes of plaintiffs. In particular, such suits offered an increasingly viable legal toehold for women engaged in the public sphere for the first time, though they remained

more likely to win cases prompted by libelous references to domestic virtue than professional competence. Meanwhile, the politically powerful commercial press achieved some success in lobbying for more lenient standards for libelous errors committed amid a media landscape of industrialized speed and national reach, such as precursors to the wire service defense and single publication rule.

Libel doctrine remained overall plaintiff-friendly into the 20th century, a fact which public officials and community leaders in segregated Southern states exploited in using libel suits to silence and scare off proponents of African American civil rights, from local movement leaders to national press outlets. The case that changed this dynamic, and American libel law itself, was *New York Times v. Sullivan*, in 1964. In that case, involving an advertisement accusing Alabama law enforcement officials of harassing and mistreating activists, the U.S. Supreme Court reasoned that libel suits by public officials could undermine the democratic value of a free press, and therefore ruled that any state’s libel law must account for the “profound national commitment,” enshrined in the First Amendment, “that debate on public issues should be uninhibited, robust, and wide-open.” The Court established a new constitutional standard under which public officials must show not only that a statement was false and harmful to their reputation, but that it was published with “actual malice”—knowledge that it was false or reckless disregard for whether it was true or false. In subsequent rulings, including *Curtis Publishing v. Butts* (1967), *St. Amant v. Thompson* (1968), and *Gertz v. Robert Welch, Inc.* (1974), the Supreme Court sought to clarify the precise legal meaning of actual malice and extended the standard to cases involving public figures as well as officials.

Courts’ broad interpretation and application of the *Sullivan* standard in the latter decades of the 20th century created a more speech-protective libel landscape. Nevertheless, some scholars declared a “libel crisis” in the 1980s and 1990s, having gathered empirical research that found neither plaintiffs nor defendants were satisfied with how they were served by the process. Calls for reform saw limited success amid battles over trade libel—suits corporations filed over claims

about their products—and emerging uncertainty created by the widespread use of new digital publishing platforms.

Legal Definition

In order to be considered libelous, a statement must be both false and harmful to its subject's reputation. An absence of either element, that is, a true statement that is harmful, or a false statement that is not harmful, means the statement is not libelous. (Massachusetts is the only jurisdiction to have held otherwise—allowing a true statement made about a private person in reference to a private matter to be grounds for a libel suit in *Noonan v. Staples* [2010].)

Libel is mostly a matter of civil law in the United States—a plaintiff files a lawsuit for damages rather than seeking a criminal prosecution by the government. Although 14 states have criminal libel laws, their use is infrequent and successful prosecutions rare. Since the 1964 *Sullivan* ruling, 38 states have struck down or significantly weakened their criminal libel laws.

There is no federal libel law, so libel lawsuits are subject to the varied doctrines of state law. When federal courts hear libel cases because the parties are in different states or because the suit raises a federal constitutional issue, state law standards apply.

States traditionally define libelous statements as falsehoods that lower a person's reputation in the estimation of their community, exposing them to hatred, ridicule, contempt, or shame. Plaintiffs typically demonstrate this as harm to their ability to associate or do business in their community. The types of false statements that are considered libelous are therefore highly context-dependent and subject to evolving social norms, but the most common and long-standing examples include accusations of criminal activity or a lack of professional competence or integrity. The types of statements that used to be considered libelous, but are no longer, include those misidentifying a white person as non-white or falsely stating someone was gay.

Elements

Generally, plaintiffs must prove all of the elements of libel in order to win a civil suit. These can be summarized as showing that the defendant made a harmful and false factual statement about the plaintiff, and that it was published with a sufficient level of fault.

Defamation

The element of defamation is the harm element, under which the plaintiff must show that the statement meets the applicable legal standard for lowering their reputation in the estimation of the community, limiting their ability to associate or do business. Libelous statements can be defamatory per se or per quod. Those that are defamatory per se are obviously harmful, such as a false accusation of criminal activity. Statements that are defamatory per quod are harmful through implication or within additional context, included or omitted. For example, it could be defamation per se to falsely assert that someone was “an adulterer”; it could be defamation per quod to falsely assert that the person was “on a date” with someone, when the person was widely known to be married to someone else.

Falsity

In libel cases involving statements about public figures or public officials, or matters of public concern, the plaintiff bears the burden of showing that an alleged libel is false. In cases involving the private matters of private people, the defendant bears the burden of proving the statement's truth. In most jurisdictions, truth is not defined as absolute technical accuracy, but can also include substantial truth—the “sting” or “gist” of a statement. For example, in spite of several technical inaccuracies in the advertisement at issue in *New York Times v. Sullivan*, the Court found that it was substantially true in its assertions about the events it was documenting: Alabama officials' responses to student protests and the arrest of Dr. Martin Luther King Jr. for minor charges. Conversely, the U.S. Supreme Court ruled in *Masson v. New Yorker* (1991) that where the use of an interviewee's own words is concerned, accurate

direct quotes can qualify as false if they are edited in a way that grossly distorts the intent of the speaker. Similarly, omitting key facts or context can render an otherwise true statement false, such as the statement “John Smith shot David Jones three times, and Jones died in the hospital six weeks later” when in fact Jones’s death was caused by a stroke, and was unrelated to being shot.

Factual Statement

A libel plaintiff must show that the statement at issue asserts something a reasonable person would consider to be an actual fact. Opinions, jokes, and rhetorical hyperbole are generally protected by the First Amendment and will not be considered factual statements for purposes of a libel suit. However, where a statement of opinion or conclusion is concerned, the implication or assertion of false facts could be considered actionable as libel. For example, the statement “in my opinion, my neighbor stole my lawn mower” rests on an assertion of fact, which could be libelous if false.

Identification

Only the person who is the target or subject of an alleged libel can sue. Others who are offended by a false and defamatory statement cannot sue on their own or the target’s behalf, including where the person defamed is deceased. In addition to being identified by name, courts have recognized a person’s job title, a specific description of them, or a photograph without a name as sufficient to identify a plaintiff to members of a community in whose eyes reputational harm could occur. Plaintiffs have successfully sued for libel over fictional characters when they can show that a reasonable person could conclude the character was based on them, particularly where the defendant did not conspicuously disclaim otherwise, or label the publication as satire.

Individual members of small, identifiable groups can sue for libel even when they are not personally named, when the allegedly libelous statement applies to “all” or “most” of the group, as opposed to “some” or “a few.” For example, a member of a university basketball team could probably claim to be identified by the statement “all the players on the basketball team cheat in their classes,” but

probably not by the statement “some of the university’s athletes cheat in their classes.”

Publication

A libelous statement need only reach a third party outside of its publisher and the subject of the statement to be considered published for purposes of a libel suit. Any publication in mass media will presumably meet this standard. Repeating or republishing the libelous statement of another, even where properly attributed, is also publication, under a standard known as the *republication rule*. It is not a defense to argue that a publisher is merely “passing on” the false and defamatory statement of another. An old libel adage goes, “talebearers are as bad as talemakers.” On the other hand, newsstands, bookstores, libraries, and other distributors of printed material are not considered publishers responsible for the content of the materials they sell or lend, since they exercise no control over that content.

Another exception to the republication rule, established in the early days of the commercial Internet, is Section 230 of the Communications Decency Act of 1996. Under that federal law, service providers—including web publishing platforms and social media—cannot be subject to civil claims for content provided by their users. A key rationale for this legal protection was that requiring service providers to monitor the posts of thousands of users would be unduly burdensome.

Fault

The level of fault a plaintiff must show—which is the legal responsibility the defendant bears for the harm inflicted—is based on the plaintiff’s status as a public official, public figure, or private person. Public officials and figures must show the statement at issue was published with “actual malice,” the standard meaning knowledge of falsity or reckless disregard for the truth established in the *Sullivan* case. Private plaintiffs must show negligence. Plaintiff status often becomes a hotly contested issue in the early stages of libel litigation, because plaintiffs would rather meet the comparatively lax standard of negligence than actual malice, and defendants would like the opposite. The issue is particularly complex when

a plaintiff is arguably a public figure for limited purposes, but a private person otherwise—either they are willingly or involuntarily associated with a narrow issue of public importance, but they are not an elected official or celebrity. Imagine a person who otherwise has no public profile, but engages in an act of heroism or is the perpetrator or victim of a noteworthy crime: They might be a public figure for purposes of publication about the public issue, but not for publication about other aspects of their life. This can vary by state law.

Actual malice is a stringent evidentiary standard. Courts generally adhere to both the spirit of the *Sullivan* ruling and its letter: In deference to ensuring broad First Amendment protection for speech that is critical of powerful people, and acknowledging that errors will be inevitable amid free and open debate about newsworthy people and issues, plaintiffs are required to provide clear and convincing evidence to show that a defendant published a libelous statement knowing that it was false, or recklessly disregarding its truth or falsity. For example, failure to thoroughly investigate a claim is likely not actual malice, though purposely avoiding the truth likely is. Deliberate distortion or fabrication of false facts can constitute knowledge of falsity, and subjective doubts about a claim can be considered reckless disregard for the truth. However, the courts' use of the term *malice* can also be misleading—whether a defendant had malicious intent or ill will toward a plaintiff may not be relevant to a finding of actual malice if the defendant otherwise demonstrated due diligence toward finding the truth in reporting the allegedly libelous falsehood.

Negligence is a more lenient fault standard applied to private plaintiffs, under which they must show a defendant published a libelous statement with an absence of reasonable care. In the context of journalism, this can include failing to take basic reporting steps expected in the profession, like verifying the facts provided by a single source.

Defenses

Defendants in libel suits have multiple paths to a successful defense. Because the plaintiff bears the burden of proving all the elements of libel in most

cases, a defendant can undercut a suit by disproving one or more of those elements. For example, a defendant might present evidence that shows a plaintiff's reputation was not actually harmed, and therefore the statement at issue is not defamatory, or the defendant can argue that the plaintiff was not sufficiently identified by the statement. Truth is traditionally considered a particularly strong defense against a libel claim.

Defenses work in a variety of ways across jurisdictions; not all of those discussed here are recognized everywhere, and their effect can vary too. While some can result in a plaintiff's suit being thrown out, others only limit the damages an otherwise liable defendant owes to the plaintiff.

One threshold issue that can arise is the statute of limitations, a period of time during which a plaintiff must sue, after which the case is no longer valid and will be dismissed. These range from state to state—from 6 months to 3 years—but the most common is 1 year. The clock for the statute of limitations generally begins running when an alleged libel is published, not when a plaintiff becomes aware of it.

Opinion

Under the opinion defense, a defendant argues that the statement at issue was not a factual assertion, and therefore not capable of defamation. This can also include jokes, satire, hyperbole, insults, commentary, speculation, and conclusions. Fundamentally, expressions of opinion—that a person or the products of their labor are bad, or stupid, or worthy of ridicule—cannot be adjudged to be true or false as a factual matter for purposes of a libel analysis. Moreover, the First Amendment traditionally extends strong protection for such statements, especially when they concern public officials or figures. However, statements are not automatically protected because they occur within the context of an opinion, joke, or argument, when they can reasonably be understood as stating actual facts. In other words, tacking “in my opinion,” “I think,” or even “I wonder if” onto a statement does not automatically render it immune from a libel claim. For example, in *Milkovich v. Lorain Journal Co.* (1990), the U.S. Supreme Court found that even though a newspaper columnist's

assertions that public school officials lied in a hearing were published in the context of opinion, they were capable of a factual and defamatory meaning—that the officials perjured themselves. Thus, courts may consider a range of factors in assessing an opinion defense, including the precise language used, its professional or social context, its common usage (i.e., whether it can be understood as a jest or slang), the reasonable expectations and probable readings of the audience, whether it is capable of an objective factual meaning (known as *verifiability*), and whether the defendant is in a position to know whether or not the statement is true. Similarly, conclusions cannot be defamatory when they are based on clearly established facts provided by the author, even when the facts are debated.

Privileges

Courts have extended special exemptions from libel suits in certain circumstances. Most significantly, in view of the need for frank debate and discussion of matters of public importance, public officials enjoy an absolute privilege for comments made in conducting their official duties.

The fair and accurate report and neutral report privileges also protect the publishers of some statements that would otherwise be defamatory. The fair and accurate report privilege can arise when a publisher fairly and accurately reports a false and defamatory statement in an official report, with proper attribution. A classic example would be the reporting of a police statement about an accused criminal, when the accusation turns out to be wrong. The privilege is based on the idea that the public is served by knowing about the accusation, regardless of its accuracy. However, states can vary on what constitutes an official report.

The neutral reportage privilege extends to the republication of a newsworthy allegation, when the allegation is made by a prominent, responsible, and authoritative individual or organization. The principle underlying this defense is that in some circumstances, an allegation is itself worthy of public attention, regardless of whether it is true or false. Imagine a candidate for public office accuses their opponent of cheating on their taxes, for example. The theory of neutral reportage is that publishers should not be chilled from

repeating the newsworthy accusation just because it might be false. The neutral reportage privilege is relatively new to American common law, having been established by a federal appeals court in 1977, so its application varies.

Other Defenses

Defendants may raise a variety of other defenses or defensive procedural measures, depending on the circumstances of a case. One is an anti-SLAPP motion to dismiss. (SLAPP stands for “strategic lawsuits against public participation.”) In the approximately 30 states with anti-SLAPP statutes, courts can throw out SLAPP suits. Such suits are generally defined as meritless, and intended not to win on legal grounds but simply to silence speakers on topics of public interest. SLAPP suits often take the form of libel suits, in which case a defendant can move for a prompt dismissal, and sometimes demand attorneys’ fees from the plaintiff.

Approximately 30 states also have retraction statutes, which can limit the damages assessed against a defendant if they acceded to a plaintiff’s request for a retraction before the plaintiff sued. Conversely, if a plaintiff fails to ask for a retraction before filing suit, they may be limited in the damages they can be awarded.

The wire service defense can be raised by defendant news organizations that republish libelous statements from a “reputable news agency” like Reuters or the Associated Press. The theory is that news organizations that subscribe to such services do so precisely because they lack the resources to verify the claims reported by the news agencies, and therefore should not be held liable for repeating their claims. The defense does not immunize the news services themselves from libel suits.

The single publication rule, recognized in some jurisdictions, limits a plaintiff to a single cause of action over the publication of a libel, even when the statement appears in numerous copies of a book, newspaper, or magazine, for example, and therefore is available to and discoverable by numerous audiences over a long period of time. Once the plaintiff has sued the publisher over the original libelous publication, a new suit cannot be triggered every time the same libelous statement resurfaces at a different time or in a different jurisdiction.

A few jurisdictions have found a plaintiff cannot sue for libel because they are “libel proof,” that is, they have no “good name” to harm. Such was the case when a convicted member of a criminal gang sued over a false accusation of a crime, or a publisher of pornographic magazines sued over accusations of adultery.

Plaintiffs also cannot sue when they have consented to the publication of a libelous statement. This can arise in instances where a plaintiff has signed an agreement to appear on television, or if a plaintiff shares a libelous personal communication with a third party—thus publishing it—in order to sue its author. The publication of the communication could constitute consent and thus invalidate a libel claim.

Damages

When a plaintiff wins a civil suit, the court usually requires a defendant to pay money, called *damages*, to the plaintiff. In libel suits, the most common form is “actual” or “compensatory” damages. These damages, intended to compensate the plaintiff for the actual harm a defendant caused or inflicted, must be based on evidence presented by the plaintiff, like the other elements of a libel case. Because harm to a person’s reputation can be difficult to demonstrate in financial terms, the amount a plaintiff can demand that a jury award for libel can be difficult to quantify. Sometimes, plaintiffs can tie their damages to a precise out-of-pocket loss, like wages lost because they got fired or quit working due to the libelous publication. This is sometimes referred to as *special damages*. Other times the proof is based on a claim that community members refused to do business with the defendant or that the harm to their reputation wrought emotional or psychological harm.

In some jurisdictions, plaintiffs can also be awarded punitive or presumed damages. Punitive damages are not intended to compensate plaintiffs but to punish defendants for their behavior, generally with the policy-based intent of discouraging other publishers from making similar libelous publications. The more egregious the libel and the context surrounding it, the more likely a large punitive damage award. Presumed damages arise in cases of libel per se, and do not require plaintiffs to provide evidence of harm, based on the

notion that harm is presumed when a statement is libelous on its face. Some states have banned or capped punitive and presumed damages. The U.S. Supreme Court, subsequent to *New York Times v. Sullivan*, has required that in libel cases involving matters of public concern, private plaintiffs can only receive punitive or presumed damages if they can show actual malice.

The range of rules around the different types of damages can help explain why damage claims in so many libel suits stretch well into the millions of dollars. Generally, juries can only award damages up to the amount claimed by the plaintiff, and because a jury’s discretion is difficult to predict, plaintiffs may demand an astronomical amount in their suit to maximize the likelihood of recovering damages.

On the other hand, suing for libel without concrete evidence of harm can result in a ruling in a plaintiff’s favor but no damage award, raising the question of whether the likely expensive litigation led to a pyrrhic victory. A similar outcome may result from a lawsuit against a defendant who has little resources from which to draw damages.

Digital Media and Emerging Issues

The broad availability of instantaneous mass publishing through the Internet and social media—and courts’ mostly supportive attitudes toward that development—has raised a host of practical and procedural questions for libel law in the first two decades of the 21st century. One point of near unanimity among courts has been that Section 230 of the Communications Decency Act—in a major deviation from the traditional standard of the republication rule—offers websites almost complete immunity from lawsuits over the libelous statements of their users. While celebrated as a keystone of free speech online, Section 230 has its critics, who see it as a license for libel that allows online publishers to avoid accountability.

Indeed, the rough-and-tumble nature of online discourse has prompted plenty of libel suits against social media users themselves. While social media are not quite the lawless arena some users may imagine it to be, a rhetorical context in which people routinely make outlandish claims or trade nasty barbs can make it difficult to successfully sue for libel because plaintiffs can struggle to establish that a statement made in such an

environment is one of actual fact capable of a defamatory meaning. Lawsuits demonstrating this challenge have been filed—and lost—over caustic Twitter posts by the singer and actress Courtney Love, the actor James Woods, tech mogul Elon Musk, and then-businessman Donald Trump, among others.

Meanwhile, as anonymity remains a hallmark of freewheeling online debate and discussion, how does one find and sue an anonymous defamer? Courts have developed a variety of standards for how a plaintiff can demand a website or Internet service provider unmask an anonymous speaker in order to sue them. Most commonly, the tests require sufficient time for the would-be defendant to mount a defense against the unmasking, evidence from a plaintiff that supports their case for libel, and balancing the interest in unmasking the speaker against protecting their First Amendment rights. Often, though, once a plaintiff unmasks a defendant, it is clear that no matter the reputational harm done, the defendant has no resources from which to draw damages, making a libel lawsuit potentially pointless.

While evidentiary standards continue to vary from state to state, the instantaneously everywhere nature of Internet publishing has encouraged plaintiffs to “forum shop,” or file their lawsuit in the jurisdiction most friendly to their claim, regardless of whether they have meaningful ties to the place in which they sue. The practice has made for busy dockets in places considered to be plaintiff-friendly.

Ultimately, changes in the libel landscape are driven by social forces as much as technological ones, however. Politics—particularly the rhetoric of then-President Donald Trump—helped focus attention on libel as a political issue beginning around 2016, as he proposed a loosening of libel laws. While the president has no real ability to render such a change, commentators have argued that his acrimony toward the press prompted an increase in politically motivated libel suits intended to burn through the dwindling legal resources of legacy media institutions at a time when they are financially vulnerable. Meanwhile, U.S. Supreme Court Justice Clarence Thomas sent a ripple through the media law community when, in a 2019 opinion concurring with the Court’s decision not to hear oral argument in a libel case, he

argued that the Court should reconsider its broad application of the actual malice standard established in *New York Times v. Sullivan*. Libel law promises to remain an active and dynamic means by which Americans debate and delineate acceptable practices of journalism and public criticism.

LIFESTYLE JOURNALISM

Lifestyle sections generally were introduced into American daily newspapers in the 1970s and typically evolved from what had been styled as women’s pages. Despite an assumption that we can all

identify what *lifestyle* might mean, most newspaper definitions are still in flux as editors seek to define what it is that readers might want to read (and what advertisers will support). Some papers have lifestyle sections that could be defined as entertainment or celebrity-driven—not much of a change in philosophy from the old women's/society sections, which concentrated on the doings of the local rich and influential. Publishers sometimes include lifestyle sections separately or have them classified as part of feature pages. Sometimes they are not included in current staff listings at all; indeed, it is instructive to see how newspaper structure has changed by studying the listings in *Editor & Publisher Year Book*. In 1976, in the middle of the decade introducing much of the change, out of 1,325 daily newspapers listed, only 48 included features editors, and lifestyle sections were represented in just nine papers (three as lifestyle and five as life/style). In contrast, during the same year, there were 706 society editors listed and 758 women's editors. These figures suggest that change and experimentation with the old structures were just beginning, as the names of new editor categories also illustrate: Scene, View, Today, People, Accent, and of course Style, the section at *The Washington Post* that has been credited with leading the lifestyle revolution in newspapers.

Origins

With the exception of some lifestyle, technology, and expanded entertainment sections, the basic structure of the metropolitan daily newspaper has been in place for more than a century. Typically, urban papers have had separate areas or sections for news, sports, opinion, and business. Feature material has frequently been sprinkled throughout these various sections and has only recently come to dominate its own section by name. Some shifts have come fairly recently; for example, there is increased attention to entertainment and lifestyle material and a corresponding decrease of social and local celebrity news. As is clear from reading the staff listings, each of these newspaper units typically has its own hierarchy of staff writers and editors involved in creating and presenting material for the different audiences who read the paper. Each section is supported by advertising that is

related to the general section topic—and indeed, some historians have argued that it is the advertising that has driven and controlled the creation of these different sections. They suggested women as an audience became of interest to editors when more advertisers wanted to reach those women with money to spend, an argument bolstered by advertisers' general acceptance that women are the buyers of most families.

Society news offered an early addition to the broader newspaper editorial mix and was important to the development of popular mass-appeal dailies, a necessary step on the way to what is today called *lifestyle* coverage. These popular newspapers began publishing daily in the 1830s with a fuller range of stories on sports, criminal trial stories, and society news items. Social coverage had its first *on the scene* reporter when James Gordon Bennett of *The New York Herald* sent William H. Attree to a costume ball given by Mr. and Mrs. Henry Brevoort in 1840. Another early society writer was William Bininger, again for *The New York Herald*. A new interest in women readers helped open the door to women writers who were best able to write about their own lives. More than one chronicler of a newspaper's history has remarked that women were believed to be more socially adept at fitting into higher social circles. There was also a shift toward elaborate descriptions of what society matrons wore to events, and again, women were believed to be more able to provide these verbal illustrations.

Joseph Pulitzer is credited with creating the first women's page, but in 1886, it began as a special column devoted to women's interests. An issue of *The World*, May 25, 1884, page 11, shows this precursor of the woman's page—the “World of Women” column. By the 1890s, women's pages were a definite feature of larger papers, publishing information about clubs, society, and other topics of interest to women. And in 1895, a phenomenon of *women's editions* of newspapers brought something new into the mix. Around the country, community women began taking over their local newspapers for a day. The power of the popular press and the importance of women's work in the community were being paired to showcase women's talents and abilities. It was the first time many women saw their names in print, and it was the beginning of a love affair with the newspaper

world for many. One of the women to get a break in one of these editions was Elizabeth Meriwether Gilmer, who was to become America's highest-paid female journalist (as Dorothy Dix) by the time of her death in 1951.

By 1900, women's pages or sections with "women's" topics were part of most large metropolitan dailies, and smaller newspapers throughout the country were quick to join. For more than a half century, the common elements of these pages were related to fashion, food, household hints, society, and advice. But not everyone was happy with the change. Women journalists wanted to write serious articles, and women readers frequently discussed the women's pages as banal. One bit of evidence is that writers for the women's editions in 1895 were penning sardonic, patronizing columns "for our female readers." And as early as 1901, women and intellectuals were complaining that the women's pages were a "hopeless case," filled with useless trivia and social news, notes Historian Marion Marzolf. These pages may have been hopeless, but they were moneymakers and advertisements located on them commanded high prices.

Despite complaints about the *drivel* contained in women's pages, they were an institution throughout the 20th century in most daily newspapers. The insistence of Eleanor Roosevelt to work only with women reporters was a boon to both women editors and women with aspirations for front-page reporting. Articles about serious social topics began to appear in the 1940s, as did items written by professional women. Some of these changes were bolstered by the increased professional activities of women during World War II, though the 1950s were to see a return to stories on beauty, cooking, society, and fashion. A decade later, women's pages became the center of newspaper and social change. Because the women's movement began to make news and because women began demanding rights for equal pay, childcare, and so on, women's pages began to run more controversial stories and interviews. While some women's editors were pleased by the increase in *real* news, some seemed to ignore these cultural happenings. Newspapers had hired increasing numbers of women, but many of them had been placed on the women's pages. They, too, were eager to change the nature of women's news. At the same time, a few courageous women's page

editors began what might be called *campaigns* to change their pages from predictable sections into columns of issues-centered reporting about equal rights, childcare, and spousal abuse. Conflict arose when advocates for women such as Gloria Steinem fought to keep news about the women's movement from being buried in the women's pages.

Unisex Lifestyle Coverage

The late 1960s and early 1970s saw the impetus for most of the dramatic changes. As Kay Mills put it, "The evolution of the women's pages marked a belated recognition that all parts of a newspaper should be prepared for all people," adding that the changes were occurring partly because of social pressures and partly because of economics. At *The Washington Post*—one of the early claimants to journalistic lifestyle development—the *Style* section, Ben Bradlee's major structural change, was introduced on January 6, 1969. The change came as longtime women's editor Marie Sauer was retiring. Instead of replacing her and continuing the women's section, Bradlee was seeking to ride the wave of social change.

Bradlee's idea was to create a section that gave cultural news and reviews a place of their own. It was to include food, fashion, fun, and culture—all directed to a unisex audience interested in an upscale lifestyle. His criticisms of women's pages mirrored those of the women in the women's movement who were trying to fight for newspaper changes. He spoke for many when he said that traditional women's news was boring and that most newspaper editors had been listening to highly intelligent women who were vocal in their criticism of women's pages with what seemed like endless information about diets, teas, and society gatherings. But the *Style* section itself was experiencing growing pains, and even when Thomas Kendrick, who became editor 2 years later, was able to bring order to journalistic chaos by setting editorial standards, there were problems. A memo from Bradlee underscored some of the change. Admonishing his reporters to avoid words like *pert*, *dimpled*, *cute*, or *vivacious*, he wrote that stories about the achievements of women should be written "without a trace of condescension." But the problems were still not solved. One of them

resulted from a letter to publisher Katharine Graham signed by 59 women at the paper who were unhappy with what they described as discrimination at the paper. This act was quickly followed by a lawsuit in 1972 filed by the same women. In her 1998 autobiography, Graham wrote, "Since the new 'Style' section had replaced the old women's pages, women had lost four jobs." Besides Graham, Meg Greenfield was the only woman in upper management at the paper.

A few editors had applauded and supported the women's-news momentum, but they were in the minority. Although there was talk and plenty of activity at a handful of papers, rarely are the stories of women's page editors presented as part of the history of newspapers. For example, although Marjorie Paxson won the highest honor at the Penney-Missouri awards for a women's page editor while at the *St. Petersburg Times*, neither her name nor an entry for *women's pages* appears in a recent biography of Nelson Poynter and the *St. Petersburg Times*. Likewise, the story of Maggie Savoy, a leading women's page editor in the 1960s, is absent from a history of the *Arizona Republic*.

Women's Editors Oppose Changes

One of the first to pioneer change in women's news within the existing structure was Dorothy Journey, an editor who had been encouraged to expand the coverage of women's activities at the *Miami Herald*. Like Colleen Dishon of the *Chicago Tribune*, she was an advocate for retaining women's sections and making them relevant to women's lives. Journey, who was hired at the *Detroit Free Press* to change the women's pages and direct a "family section," has addressed what happened during the change in the late 1960s and early 1970s. Applying what happened at the *Post* to newspapers throughout the country, Journey then explained that what really happened throughout the country was that the women's editors lost their jobs to men who knew nothing about women's basic interest in social issues. Women's advocacy and news for the women's pages just disappeared.

Journey was not alone in being unhappy with a looming, much-discussed shift to lifestyle reporting from women's sections. Writing in *Editor & Publisher* in 1973, June Almqvist, women's editor of the *Seattle Times*, wrote that some women's

sections of the country jumped out of the window too quickly: "In their eagerness for change, they lost their identity—becoming, at best, general-feature sections and, in some cases, hodgepodge sections" (p. 28). One trap, she noted, is that women's sections had become dumping grounds for other areas of the newspaper—bridge columns, coin-collection columns, travel stories, and so on. On the opposite side of the coin were women's sections that "went overboard" on social issues such as rape, poverty, and venereal disease. But as Alquist noted, "the biggest fattest ads in the newspaper are the grocery ads, the fashion ads, the home furnishings ads. And we know full well why those advertisers want to be in the women's sections: because the major buyers of consumer goods are women" (p. 28).

Earlier that same year, the Penney-Missouri workshop sessions at the University of Missouri tackled the problems facing women's editors at this time of change by honoring Judith Anderson of the *San Francisco Chronicle's* "People" section with the first Paul L. Myhre Award for Excellence in Reporting. These influential Penney awards were instrumental in changing the face of women's news and inadvertently promoting the lifestyle impetus.

Lifestyle can today be defined as a universally accepted descriptive with the categories of gendered, feature, cultural, and even entertainment writing. Because it is less commonly used as an identifying label for editors throughout the newspaper industry—only 152 lifestyle editors of 1,325 daily newspapers in 2006—it must be understood as a description of feature material that is usually gender-neutral, that is, *family* instead of *women's* articles. Even though one commonly thinks of *lifestyle* sections as having superseded women and society sections, the indications are that at some papers, women and society editors are still firmly entrenched. In fact, a recent return to women's news at the *Chicago Tribune* has been widely imitated and is still being evaluated for possible industry change by newspaper trend writers.

LITERARY JOURNALISM

Literary journalism can be understood as part of the larger genre of literary nonfiction. Literary nonfiction itself is a wide-ranging category that can include journalism, memoirs and other autobiographical writing, essays, history, biography, and scholarly articles.

Literary journalism, sometimes called *creative nonfiction*, *literary reportage*, *the literature of fact*, and *the nonfiction novel*, is fact-based, in-depth reporting that uses literary techniques of writing. Examples of these storytelling techniques, which are commonly used in both literary fiction and

literary nonfiction, include description, scene-setting, dialogue, dramatization, and characterization (to name a few).

And like other literary works, such as the novel, literary journalism usually expresses a larger or “literary” truth about some universal aspect of human experience. Thus, Stephen Crane’s “The Open Boat” (1897), a work of literary journalism (not a short story) about a shipwreck and his subsequent escape, underscores how human beings are at the mercy of natural forces. When Dorothy Day wrote a piece of literary journalism in 1945 about the United States’ atomic bombing of Japan, she went far beyond the simple factual reporting of an event. Whereas most journalists emphasized the surrender of the Japanese and some celebrated the potential peacetime benefits of the new atomic technology, Day’s interpretation was quite different. She masterfully evoked the horror of this large-scale attack on civilians, the first time that such weaponry had ever been used, and even predicted the disturbing prospect of an arms race. This is a theme to which, as a thoroughly pacifist writer, she often returned. Such an interpretive slant is the province of literary journalism.

Literary journalists often produce book-length works (e.g., Joan Didion’s *Slouching Towards Bethlehem*) but also commonly write shorter pieces (such as Gay Talese’s “Frank Sinatra Has a Cold”). Literary journalism transcends the limitations imposed by the requirements of conventional journalism to offer a nuanced, interpretive view of factual reality, what some have called the *feel* of the facts. Rather than hewing to the strictly objective or at least neutral viewpoint dictated by conventional journalism’s professional norms, literary journalism’s viewpoint is unapologetically subjective. It is based on extensive research that is generally far beyond the scope of conventional journalism. Conventional reporters may interview a few personal sources and peruse several documents in order to produce a standard daily news story. But the immersion or saturation research practiced by literary journalists may require, for example, months and even years of interviewing multiple sources and investigating archival documents. Thus, unlike a conventional journalism story’s daily and even minute-by-minute deadlines,

a work of literary journalism may be weeks, months, or even years in the making.

Voice in literary journalism is distinctive and not at all necessarily that of the third-person, the traditional voice of conventional journalism. Literary journalism often uses the “I” (or the “we”) and occasionally, the “you.” A powerful example of the former is Meridel Le Sueur’s 1935 piece “Sequel to Love,” which presents the direct, first-person voice of a narrator, a young, unwed, mentally disabled girl in an institution who has been forcibly sterilized after having a baby. An effective example of the second-person voice is seen in James Agee’s *Fortune* article, “Cockfighting,” which directly addresses his Depression-era audience of wealthy businessmen as “you.” This helps underscore Agee’s interpretation of illegal cockfighting as a practice that unites both the gentlemanly class (his *Fortune* readers) and the underclass in a kind of ancient, individualistic blood ritual.

The structure of literary journalism is also distinctively different from that of conventional news journalism. While the latter uses the inverted pyramid structure, presenting every fact in order of decreasing importance, literary journalism arranges structure to serve its writer’s artistic purpose. That could mean, for example, flashbacks, parallel crosscutting narratives, and other manipulations of time. The summary lead is not required.

Finally, factual verifiability is a defining characteristic of literary journalism. Literary journalists aim to be recorders of reality, not its inventors. So they eschew composite characters. They do not present dialogue unless their sources have actually uttered it. Writers such as *The New Yorker*’s Lillian Ross and John Hersey were sticklers for factual accuracy, which they argued is simply mandatory for all journalists.

History

Literary journalism’s Anglo-American history is substantial and dates at least to the English writer Daniel Defoe (1660–1731). His *A Journal of the Plague Year*, first published in 1722, is a painstakingly and artfully reported account of the devastation the Black Death wreaked on London in 1665. Although Defoe was only 5 years old in 1665, his account is exceptionally vivid and affecting

because of his extensive research, which included interviewing eyewitnesses. In this late 17th-early 18th-century period, the great early British essayists—who include Richard Steele (1672–1729), Joseph Addison (1672–1719), Jonathan Swift (1667–1745), and James Boswell (1740–1795)—also figure importantly in the history of literary journalism. They spurred the development of the periodical essay, an important literary and journalistic form of the 18th century. Many colonial American newspaper editors, such as James and Benjamin Franklin, were deeply influenced by the essays Addison and Steele published in their periodicals, the *Tatler* and the *Spectator*.

In the United States, which has a rich tradition of literary journalism, three time periods stand out in which the production of such writing was unusually vigorous. As the scholar Thomas B. Connery has noted, these are (a) the late 19th century, (b) the Great Depression of the 1930s, and (c) the period of the 1960s and 1970s. (These are approximate time boundaries). Each of these periods was characterized by societal upheaval, which seems to have fostered journalists’ forays into literary journalism, which they may have seen as a more in-depth, interpretive way to report on an increasingly complex world.

Literary journalism in the 19th century was practiced by Margaret Fuller, William Hazlitt, and Charles Dickens, among others. The late 19th-century’s literary journalists include Walt Whitman, Stephen Crane, Abraham Cahan, Lafcadio Hearn, Jacob Riis, Theodore Dreiser, George Ade, Julian Ralph, and Richard Harding Davis. Between the two World Wars, the Great Depression inspired literary journalism by writers such as Dorothy Day, Meridel Le Sueur, and James Agee. Important practitioners of literary journalism who emerged in the early 20th century include John Dos Passos, Martha Gellhorn, Ernest Hemingway, John Hersey, A. J. Liebling, Joseph Mitchell, George Orwell, Lillian Ross, John Steinbeck, and Rebecca West.

In the so-called *New Journalism* period of the 1960s and 1970s (and beyond), literary journalists such as Truman Capote, Joan Didion, Norman Mailer, Gloria Steinem, Gay Talese, and Tom Wolfe became prominent. Some of them referred to their writing as *New Journalism*, arguing that it

was so unconventional as to be quite distinct from conventional news reporting, in which the reporter strives to remain invisible and maintain an objective voice. Wolfe was the chief popularizer of this nomenclature, using it as the title of a 1973 anthology of literary journalism, *The New Journalism*, that he edited. It included works by Capote, Didion, Mailer, Hunter S. Thompson, and Wolfe. But contemporary scholars disavow the adjective “new,” pointing to literary journalism’s long pre-20th-century history.

In the later 20th century and into the 21st, widely read literary journalists include Sara Davidson, Barbara Ehrenreich, Michael Herr, Tracy Kidder, Jane Kramer, Rosemary Mahoney, John McPhee, Richard Rhodes, and Ron Rosenbaum, among many others.

It should be noted that another such period of ascendancy in literary journalism’s development may possibly be found in the U.S. antebellum period (approximately 1815–1860). Then, strong reform and radical movements to abolish slavery and to advocate for world peace, temperance, and women’s suffrage flourished. They generated many social movement periodicals that published passionate reporting about these causes, sometimes in the style of literary journalism.

Primary publication outlets for literary journalism include magazines, especially *The New Yorker*, which since its founding in 1925, more than any other publication has supported and published the work of many literary journalists, including the legendary Joseph Mitchell, Lillian Ross, Truman Capote, and John Hersey. Indeed, Hersey’s book *Hiroshima*, an account of the atomic bomb’s impact on that city, was first published in its entirety in a single issue of *The New Yorker* in 1946. And Capote’s *In Cold Blood* was first serialized in *The New Yorker* in 1965. *Esquire*, *Rolling Stone*, *Harper’s*, *Texas Monthly*, *Saturday Evening Post*, and *The Atlantic* are among other magazines that have regularly published the work of literary journalists. In the late 19th century and into the early 20th, newspapers also served as a common outlet for literary journalism.

Frequently, though, literary journalists develop their subjects into full-length books. This enables them to provide the depth and interpretation that is impossible to achieve in the typical brief daily news stories of conventional journalism. In the

early 20th-century newsroom, it was common for writerly news reporters such as Ernest Hemingway to aspire to write the great American novel. By the late 20th century, literary journalism—really, literary nonfiction—had eclipsed traditional literary fiction forms such as the novel in importance and popularity. Thus, in the early 21st century, reporters were much more likely to aim their literary sights on a book-length work of literary journalism.

An International Genre

In the early 21st century, literary journalism is being produced around the globe. A key example is the work of Svetlana Alexievich, a Belarusian journalist who writes in Russian and who was awarded the 2015 Nobel Prize in Literature for her literary journalism about the turmoil of Soviet and post-Soviet life. Significantly, this was the first time that the award was given to a literary journalist. Alexievich’s work is widely available in English translation, including her books *War’s Unwomanly Face* (1985), *Last Witnesses* (1985), *Zinky Boys: Soviet Voices from the Afghanistan War* (1990), *Voices from Chernobyl* (1997), and *Secondhand Time* (2013). She has developed a distinctive method of collecting oral histories and then presenting them as a kind of documentary testament. The vigor of global literary journalism is also shown by the work of Ryszard Kapuściński (1932–2007) of Poland, Gabriel García Márquez (1927–2014) of Colombia, and Helen Garner (born 1942) of Australia, among many, many others.

Methodological Issues

Perhaps not surprisingly, two issues that may challenge practitioners of literary journalism both stem from their hallmark intensive research.

First, spending months and even years researching a story brings a reporter very close to his or her sources. Susan Sheehan, in producing her 1976 book, *A Welfare Mother*, grew so close to her sources, a New York City welfare mother and her family, that she accompanied them on a visit to their native Puerto Rico. Sheehan even brought along her daughter, who had grown to know this family as well. Some might argue that such

familiarity is detrimental to the kind of dispassionate viewpoint that they see as journalism's true goal. But literary journalists assert that such saturation research yields a nuanced, informed perspective that transcends the limitations of quick-study, daily-deadline conventional journalism. Only by spending that amount of time with her sources and remaining close to them over a very long period could Sheehan gain the insights that she reports in her book. Literary journalists typically value a practice of responsibility, which permits them to deeply interpret their subjects provided they have completed exhaustive research as a basis for those interpretations.

Second, interior monologue is a technique that was popularized by various writers of so-called *New Journalism* in the 1960s and 1970s. This is the practice of getting inside a character's head—that is, stating what the character was thinking at this or that time. Although common in fiction forms such as the novel, interior monologue has sparked controversy when used in works of literary journalism. For example, Truman Capote was roundly criticized for his use of it in *In Cold Blood* (1965), his account of the murder of a farm family in Kansas and its consequences. Critics asked how he could accurately state what various sources were thinking at different times, without any qualifiers. He was also criticized for taking the diary of a murdered girl and then using that information to intuit her thoughts, which he presented as factual quotations. Today, however, this controversy has died down, and many regard the use of interior monologue by literary journalists as an acceptable convention, not to be taken literally but perhaps understood more as intended to communicate the emotional overlay of factual reality.

In sum, literary journalism is a vibrant form of writing that continues to engage writers and readers around the globe. One measure of its ascendancy is the continued growth of the scholarly organization the International Association for Literary Journalism Studies. Founded in 2006, through its annual conferences and its academic journal, *Literary Journalism Studies*, it promotes study of the theory, history, and teaching of literary journalism worldwide. It has brought attention particularly to non-Anglo-American literary journalism, publishing numerous articles about

international literary journalism written in languages other than English.

LIVEBLOGGING

Liveblogs are a news format that is native to the web and are now an established part of the news ecology in many countries. Characterized by reverse chronological posting of information in time-stamped updates, participatory features, and prodigious use of multimedia and hyperlinking, liveblogs hold much in common with the more established formats, the blog, and rolling broadcast news coverage. This entry starts by defining and explaining the key features of liveblogs, before mapping out the theoretical and empirical directions that scholars have taken in their study of this form of news.

Defining Liveblogs

Although liveblogs are native to the web, they also are adapted to consumption through mobile news apps. They are marked by short updates on an unfolding event, typically presented in a time-stamped block format and akin to conventional blogs, in reverse chronological order. However, unlike traditional blogs, liveblog updates are typically very short—often three or four lines—and updated continuously during the course of an event. While each entry of a liveblog constitutes its own structure, it has to be interpreted as a part of a larger whole. Each entry is therefore a kind of micro-report on one element of the story, focusing on a specific but incomplete stage of an event. Resultantly, liveblog updates interact with each other by correcting or modifying previous updates as the story unfolds. In this sense, liveblogs could be considered a textual version of live or rolling news broadcasts, though as explained later, they do retain some unique characteristics.

Liveblogs are well suited for journalists to cover scheduled mediated events where episodic publics emerge to experience the live event collectively. Unsurprisingly, then, sport is the news genre where liveblogs have their deepest roots and

continue to be most commonly found. However, they are also regularly seen in entertainment (covering such events as the Academy Awards or Eurovision Song Contest) and politics (particularly around scheduled set-piece political events like speeches, debates, and parliamentary proceedings). Liveblogs also follow unscheduled breaking live news events such as political crises, extreme weather events, or terror attacks, where audiences look to news organizations for immediate news coverage of rapidly evolving events as they unfold.

Because they are following live and unfolding events with regular updates, liveblogs meet a number of news values. Unsurprisingly then, liveblogs are popular with both newsrooms and audiences and have become a central journalistic format of online news platforms in a relatively short space of time.

Distinguishing Features

Liveblogs are distinguished by a number of features. The first is *temporal*: They are a type of news format specifically designed for live and unfolding events and their modality reflects this liveness. In most cases, these short updates convey the fluid, incomplete, and unpredictable nature of the story, drawing parallels with the dynamics of live television or radio news reporting, which had historically held a monopoly over live event coverage. These features represent a particular discourse of live news that is open structure, contrasting with closed structure news formats typified by fixed timing, tight framing, parsimony, and summative character.

The second distinguishing feature of liveblogs is their *tone of voice*, which is often dialogic in nature. Livebloggers typically position themselves as curating a conversation, acknowledging the presence of readers as participants and how others are reporting on the event, with the tone of the liveblog reflecting this. Depending on the topic, liveblogs can often be playful, light, personal, and informal.

This links to a third key feature: *interactivity*. As they cover unfolding events, livebloggers often reach out to their audiences for eyewitness reports (during crisis events), personal experiences, or reactions to the latest news as in real time.

Finally, liveblogs are notable by their *intertextuality and polyvocality*. While the manifest presence of input materials is not a feature unique to liveblogs, the frequency, volume, and form of the materials they draw upon distinguish them from other news structures. Aside from multimedia, liveblogs are abundantly furnished with other external materials such as direct and indirect versions of official announcements, elite quotes, reports, and eyewitness accounts, often sourced via social media.

Theoretical Directions in Research

The study of liveblogs takes scholars into conversation with some of the key theories of journalism—some of which are foundational, and others more contemporary. These include objectivity and the journalistic voice, networked journalism, participatory journalism, news sourcing, and epistemology.

Objectivity and the Journalistic Voice

Certain conventions of objectivity such as the absence of personal voice are challenged by the co-presence of the audience and the journalist on the news platform, and in the face of a live and unfolding event. Journalists must also deal with balancing perspectives in real time, where sources are scattered among social media (and other networks). This provides a rich context in which to study the objectivity norm in liveblogging.

Networked Journalism

Several scholars have suggested a shift in journalistic roles as authoritative narrators to curators or “gatewatchers,” who gather, sift, verify, and interpret material but play weaker gatekeeper roles. Liveblogs would seem a good example of this decentered model of journalism, whereby journalists are collecting and circulating key parts of the unfolding story from various sources, while themselves (as the author) still subject to the unpredictable nature of the event itself.

Participatory Journalism

Here, facilitated by technological advances and participatory culture, journalists are seen to move

from a hierarchical model of information dissemination to a more horizontal model based on audience participation and conversational modes of communication. Within this discourse, frontiers between creators and consumers of information increasingly blur, thus potentially empowering audiences. Given this backdrop, researchers of liveblogs are questioning the reality of participatory journalism in newsrooms and journalists’ practices.

News Sourcing

Historically, the elite-centric nature of journalistic news sourcing has been the source of much criticism in journalism studies literature, but these debates are being revisited in light of the growth of new journalistic formats. In the case of liveblogs, they have been popularized alongside the contemporary culture of online participation, which broadens the available pool of potential sources and places both elite and nonelite sources on the same social media platforms. A theoretical (and empirical) question is, therefore, whether liveblogs are a disruptive platform for opening up the news to more voices compared with more conventional formats, or whether they perpetuate traditional sourcing patterns.

Epistemology

Building on the recognition that liveblogs disrupt both sourcing practices and narrative dynamics of conventional story-based journalism, some scholars have in recent years argued that liveblogs have a different epistemic characteristic. That is, they engender a different form of knowledge creation to a summative news article. The transparent nature of providing live updates—often with caveats about accuracy or sometimes later corrections—captures simultaneously a claim to immediacy and uncertainty that has a unique epistemic value in its own right.

Empirical Directions in Research

Existent empirical research on liveblogs can be mapped onto four main strands that mirror major approaches to journalism studies generally: *audience* use of and engagement with liveblogs,

liveblogging in the *newsroom*, *content* analyses, and *sourcing* practices.

Audiences

Surveys of audiences, alongside user data accessed from news organizations, have revealed news readers' use of, participation with, and attitudes to liveblogs. Interestingly, these studies suggest that news consumers perceive liveblogs to be more balanced and objective than other news reports, because of the range of opinions they report and the transparency of the sourcing practices.

Newsrooms

Typically based on interviews with journalists, newsroom studies offer some valuable insights on the journalistic practices of livebloggers and their relationship with audiences. These studies confirm the demand for audience interaction with liveblogs, though they also document the various filters that audience material must go through before being published. High on this list is verification. Here, while some have found rather looser cultures of corroboration in liveblogging, most newsroom studies find—at least when it comes to crisis events—that verifying audience material is a major obstacle to including more diverse voices in the news. Given the immediacy and liveness of liveblogs, newsroom studies find that journalists often rely on mainstream sources such as other news organizations.

Content

A smaller number of studies have examined the content of liveblogs. Here, research has revealed, for example, how audience and journalistic frames interact and compete in liveblogs, where in a space of potential co-production, journalists still reframe amateur contributions by appending their own frames onto them. Other studies have focused on the role of the journalist, finding that some sports journalists embrace a norm of subjectivity in their interaction with readers in order to attract partners in dialogue among the audience. Another strand of content studies looks at how competition between news organizations not only determines whether they run a liveblog but also influences editorial strategies toward the event itself.

Sourcing

Similar to other empirical approaches, sourcing analysis studies are also preoccupied with questions of audience voice, among wider questions of power and access to public debate. The question of who gets to speak in liveblogs does not seem to have a uniform answer. Studies find that certain news genres like sports offer greater audience participation than crisis or politics, whose sourcing practices remain quite traditional. Furthermore, while liveblogs rely heavily on social media content, it is more likely from elite sources than everyday citizens or eyewitnesses.

Future Research Challenges

While liveblogs are now a firmly established journalistic practice, research into liveblogs is still in its relative infancy. First, for a news format that is established across the world, existent empirical liveblogging research is remarkably UK-centric and there are significant empirical gaps in large parts of the world outside northern Europe that future research should explore. Questions abound if the characteristics and patterns outlined in this entry are consistent across cultural boundaries, across different types of news organizations, and within different media systems. Second, research into liveblogging is typically drawn toward major news brands, in part because they have the resources to run frequent liveblogs, but there may be different sourcing dynamics in news organizations depending on size, geographic focus, or subject specialisms.

LIVESTREAMING

Livestreaming refers to the broadcasting of real-time, live video to an audience over the Internet. Usually carried out via a mobile phone, it allows citizens to broadcast to different audiences as well as journalists working for mainstream media organizations. Popular platforms that allow journalists and citizens to stream material include Facebook Live, Instagram Live, Periscope, and (formerly) Meerkat. It has raised ethical issues that challenge journalistic norms about what should be broadcast and what should not. This entry examines the origins and development of livestreaming, its impact on journalism, and some notable livestreaming controversies.

Origins

Broadcasting live news was traditionally a complex and costly operation, open only to mainstream media organizations. It required significant investment in equipment and personnel and expertise to operate. After the advent of CNN in 1980 and the development of 24-hour news channels, live reporting of news events became popular in the 1990s.

However, in the mid-2000s, the public's capacity to also record events started to change journalism practice. In 2004, key footage of the South Asian tsunami was taken by onlookers using camcorders. By the time of the 7/7 bombings in London the following July, the BBC was being sent considerable amount of footage and photographs from the public, known as *user-generated content (UGC)*, which led to the development of the BBC's UGC Hub. Increasingly sophisticated smartphones with better quality cameras allowing people to take high-quality photographs and record videos came on to the market. At the same time, social media sites emerged—in particular Facebook in 2004, YouTube in 2005, Twitter in 2006, Instagram in 2010, Snapchat in 2011, and TikTok in 2016.

The idea of livestreaming was first popularized by nonjournalists. Early in 2007, the entrepreneur Justin Kan used a head-mounted webcam to continuously stream his life 24/7 via the live video platform Justin.tv. This experiment (known as *lifecasting*) went on for 8 months, and Justin.tv (later known as *Twitch*) developed to allow anyone to provide a live video stream. Twitch was eventually sold to Amazon in 2014 for nearly \$1 billion.

But the use of livestreaming in journalism is usually dated back to the work of Tim Pool during the Occupy Wall Street protests in 2011 who pioneered experimentation with mobile journalism and online platforms. Pool, who had previously uploaded non-journalistic videos to YouTube but went on to define himself as a journalist, headed down to the protests where he livestreamed the protests on Ustream, working with Henry James Ferry, creator of the *wearetheother99.com* website, and allowed viewers to both live chat and direct where he should shoot. Pool who went on to work for Vice, also covered the Gezi protests in Turkey in 2013 and won the journalist category at the Shorty Awards that honor social and digital journalism the same year.

At the same time, the Syrian conflict from 2011 onward saw a growth in other citizen journalists who also started to use this new tool. Demonstrators attempted to document the protests themselves. Some of these content creators blurred activism with journalism, others adhered more to the journalistic norm of objectivity but with mainstream media having limited access to the country, their material began to be widely used. Sites such as Bambuser were used to livestream the video they were taking.

The real step forward however was the development of easy-to-use livestreaming apps such as Periscope in 2015, followed by Facebook Live in 2016.

Development

Periscope was developed after one of its inventors Kayvon Beykpour was in Istanbul at the time of the Taksim Square protests in 2013. It was acquired by Twitter before its release and within 4 months had 10 million users. A month before Periscope's launch, another livestreaming app, Meerkat, which allowed users to link to their Facebook or Twitter accounts, had been released, but Twitter's decision to cut off Meerkat's access to their social graph meant that Meerkat faded away by 2016.

Mainstream media had started to see the possibilities of livestreaming, with journalists using Periscope for covering protests in the aftermath of the death of Freddie Gray who died in police custody in Baltimore in 2015. But it was the 2015 refugee crisis that proved particularly popular for journalists to use livestreaming. The reporter Paul Ronzheimer working for the German newspaper *Bild* traveled across Europe with refugees using Periscope to livestream. This had several benefits: First, his phone was far more unobtrusive, so he was able to get past the border authorities without being challenged. Second, it allowed his audiences to interact with the refugees via live chats and for misinformation to be corrected.

While the videos could only be played for 24 hours in the app, they could be saved to the reporter's phone and *Bild* subsequently made a documentary from the footage. *Time* magazine also used Periscope to cover the crisis, while the BBC Panorama program used Snapchat for instant updates.

The realization that people were watching so much live video online caught Mark Zuckerberg's attention. The founder of Facebook put a hundred of his company's engineers for 2 months to create a tool. Two billion people were then given access to Facebook Live when it came online in 2016 and livestreaming went mainstream. After only 12 months, one in five Facebook videos was a livestream.

Impact on Journalism

There have been several impacts on journalism as a result of livestreaming and it has called into question the conventions of news reporting. First, it brought increased pressure around the questions of who acts as a witness. Prior to the growth of UGC in the mid-2000s, one of journalism's main roles was to bear witness and tell stories that would otherwise not have been told. With any citizen armed with a smartphone and a good connection able to report from the scene, this challenged journalists' privileged status. And with certain stories—such as the Syrian conflict—it became almost impossible to cover such stories without using citizen journalists.

The perceived “authenticity” of such citizen journalism at a time contrasted with the increasing distrust of mainstream media, compounding the issue. Even more, private social media platforms such as Facebook began to act as a vector for transmitting news, bypassing mainstream organizations altogether.

As a result, legacy media started to co-opt this mode of reporting, also livestreaming and integrating new tools such as drones in order to continue to attract audiences and engage them. For example, a reporter from BBC 5 Live used Periscope to record the devastation in a village in the Sindhupalchok district on his phone during the 2015 Nepal earthquake. This challenged conventions around length, format, and expectations; a livestream does not adhere to a conventional 30-minute news bulletin, for example.

It also gave journalists more flexibility—instead of a whole camera crew, only one person and a smartphone were needed, meaning that news could be produced more cheaply, making it easier for small media outlets in developing countries and also freelance journalists.

Another impact was the fact that livestreamed videos became objects of news coverage themselves. Just as collating and describing tweets at the time of the Haitian earthquake became ways of mainstream media covering a story, so too Facebook Live videos were picked up by news organizations. This can range from the funny (the 20,000 people who watched a livestream of pedestrians trying to negotiate a large puddle in

Newcastle, England, in January 2016) to the serious—for example, Diamond Reynolds’s livestream of the aftermath of the fatal shooting of her boyfriend Philando Castile by a police officer in July 2016 in Minnesota. She started the video with the words “Stay with me” before panning to Castile whose shirt was soaked with blood, and going on to document her interactions with the authorities for as long as 10 minutes after the shooting. The video was shared by Black Lives Matter activists and a succession of protests and vigils were held as a result. It then made its way into the main bulletins, influencing the news agenda, which may also lead to further public awareness and more videos posted, sustaining the news cycle.

Finally, while much of the focus has been on covering outside events, another development has been for journalists to interact with their audiences by deploying their expert commentators on Facebook Live feeds to comment on stories. Newspapers like the *Financial Times*, for example, started to regularly use livestreaming as a way of allowing audiences to interact with their pundits, while *The Independent’s* political team would livestream analysis on the weekly Prime Minister’s Questions held in the House of Commons. And, during the 2017 UK general election, BuzzFeed used Facebook Live for its coverage of the night’s unfolding dramas.

Controversies and Ethical Difficulties

The increased use of livestreaming however has given rise to several ethical questions around its use. Unlike traditional broadcasting news, the immediacy of livestreaming means there is not time to assess content in the same way as in a newsroom, where there may be a producer, editor, video editors, and even an editorial board to consider whether this footage should be broadcast in this way.

In some cases, there have been problems around whether livestreaming could interfere with police or medical personnel during crisis situations. It has become increasingly common—as happened in the middle of the 2015 Brussels lockdown, when the police asked users to stop tweeting or livestreaming about operations taking place as such information could also be read by the terrorists.

News reporting conventions mean that in certain situations, people’s identities or appearances are obscured, for privacy or protection reasons, and that the moment of death is not shown. With the immediacy of livestreaming, there may not be the capacity to observe these norms. And while journalists may adhere to these norms in their own work, linking to other people’s livestreams or rebroadcasting the footage may not do so. For example, when the Bangkok bomb blast happened in 2015, a Periscope user Derek van Pelt filmed the aftermath live, exposing viewers to traumatic images before he realized he was filming body parts.

Van Pelt later said that he had not realized what he was filming; in other cases, sometimes people do know what they are filming. Suicides, murders, and terrorist attacks have all been Facebook Live “events.” In 2017, four people in Chicago were charged with hate crimes, kidnapping, and battery after a Facebook Live video showed them beating a disabled man, while a year earlier in 2016, a double murder of police employees in Paris was broadcast with ISIS claiming responsibility.

When journalists then take such footage and re-broadcast it, this can allow terrorists in particular to use livestreaming to spread messages of violence, fear, and hate. Social media platforms rely on artificial intelligence to spot violating content and remove it as soon as possible, but that has not always proved effective. In 2019, Facebook came under fire for the spread of a livestreamed video that showed the New Zealand mosque shootings that left 51 dead. It subsequently said it would work with London’s Metropolitan police using body cameras to increase the number of first-person images in order to train its machine-learning tools.

But media organizations then have to decide how they cover such stories as well. New Zealand’s official censor banned the shooter’s document justifying his actions as well as video of the attacks. Some mainstream media outlets however did broadcast clips of the killer’s livestream, despite fears that this could lead to copycat crimes and also that wide dissemination of such footage was clearly what the shooter wanted.

The Future of Livestreaming

Livestreaming has had a significant impact on journalism in contesting norms around format, ethical approaches, and boundaries of journalism. The ability of ordinary citizens to not only document news events but broadcast them easily and cheaply to a wide audience has questioned journalists' precedence in bearing witness to noteworthy events.

Filming from a first-person perspective, in an immediate rather than polished way, has contested the objectivity norm and the idea of journalism as a finished product. This has challenged where the boundaries of journalism lie, as mainstream media organizations have both co-opted livestreaming footage into their own coverage and adopted livestreaming themselves in order to attract viewers.

Innovative approaches have resulted in powerful journalism such as the reporting of the 2015 refugee crisis, and use of livestreaming to take viewers behind the scenes of events.

However, ethical problems are still being debated. While the immediacy and perceived authenticity of such footage continues to attract viewers, issues over protection of victims and impeding crisis response are yet to be fully worked out. In addition, the use of livestreaming to share acts of violence and terrorism remains problematic.

LOCAL JOURNALISM

Local journalism is broadly defined as a professional practice and a product that is specific to a geographic area and focused on the people and events that are connected to that geographic area. There is debate as to the size of a local geographic area, as well as the different audiences served. Local journalism is a critical component of journalism broadly because of the many impacts that local journalism has on communities and civic society. The work of local journalism is just as important in large metropolitan regions as it is in rural communities; further, local journalism is not tied to a specific media format, but is experienced across media, from television to radio to print to the web.

Local journalism outlets include television stations, radio stations, newspapers, and media websites. Increasingly, local journalism also includes the dissemination of content via social media outlets. Collectively, these outlets work in aggregate to provide a local journalism. Regardless of media outlet, local news serves a critical function in providing information to community members. Illustrating the importance of local journalism, Pew Research Center reported in 2019 that 73% of Americans follow local news at least somewhat closely, and nearly 9 of every 10 Americans (89%) obtain some of their local news digitally (websites, apps, or social media). The second statistic points to the challenge of the growing role of digital in the context of local news.

This entry examines local journalism by first considering the various dimensions that comprise local journalism, and then by examining the impact that local journalism has on the communities covered by a local news outlet. The impact of the demise of local journalism is also examined in order to better understand the state of the industry. Finally, this entry examines the impact that local journalism has on a given community and

the impact on the function of government within that community.

Dimensions of Local Journalism

In defining local journalism, there is a clear challenge in framing what counts—and what does not count—as local. Prior research has defined local news from a variety of dimensions, although most research has focused on two schools of thought: an audience-centric perspective and a geographic approach.

The audience-centric approach to defining local journalism focuses on defining local journalism through the perspective of audience members in a given community. This emphasizes understanding what audience members see as directly relevant to the local context. This approach is advantageous in some instances as it emphasizes consumption and frames the discussion of local journalism through the lens of what community members see as valuable. The term *local* evokes different responses from different audience members, but broadly connects to the sense of geography, place, and community that help to create a sense of belonging. Thus, an audience-centric view emphasizes how audiences come to understand and experience local news and how that experience impacts their perception of a given community.

A geographic approach looks to define local journalism based on geographic areas. For instance, some scholars have defined local media based on the geographic boundaries of a given county. Others define local journalism as the media outlets that are physically located within city limits of a specific town that is the focus of a study. In another line of work, researchers used fixed mileage ranges to represent media outlets covering a given region.

The advantage of a geographic approach is that it sets specific boundaries for what is counted as local journalism and removes subjectivity. A challenge of this approach is that the geographic area covered by a local journalism outlet depends in large part on the type of media. Local broadcast television stations tend to have a wider geographic reach than newspapers and also reach a larger audience. Radio stations tend to have an even wider footprint than local broadcast television, but also tend to reach a smaller audience. Websites

are more complicated in terms of both geographic reach and audience; websites are not bound by geographic region, but it is also easier to target content to specific audiences. For instance, Facebook has explored the use of geographic targeting to create local news pages that serve specific towns and regions. Similarly, newspaper companies such as *The Washington Post* are using keyword targeting to reach specific audiences searching online for news on topics related to certain keywords. Thus, the geographic framing of local journalism can help to create clear boundaries, but the classification of what counts as local journalism is complicated by the variation in focus of the various media outlets covering a given community.

The Demise of Local Journalism

There is significant variance across the United States in terms of the degree of access to quality local journalism within each community. Since 2000, local journalism has faced increasing competitive pressure and a declining business model. Traditional local journalism outlets (print, radio, and television) have faced significant struggle in part because of the success of online-only news media outlets, as well as mobile apps and social media, in attracting large users bases. These online outlets have also been quite successful in attracting advertising dollars, including at the local level, because of the ease with which advertisers are able to target specific users via online advertising. Moreover, online platforms have given users a mechanism to produce and distribute local journalism, often in place of traditional local journalism. Examples include community reporting on Patch.com websites in the 2010s and the acceleration of community reporting and community information sharing on social media outlets such as Facebook and Twitter. Many communities today have their own private or public Facebook group, where one will frequently find community activists reporting on events such as local sports or school board politics.

Simultaneously, a significant body of research has focused on the demise of local journalism, particularly in the second decade of the 21st century. According to a report from the University of North Carolina, newspapers have been

particularly hard hit by the decline, with weekday readership of U.S. newspapers declining from 122 million daily readers in 2004 to 68 million daily readers in 2019. In part, the decline in advertising revenues has led local newsrooms to slash the number of reporters covering a given community, or to cut salaries in order to reduce operating expenses. The number of journalists in this period fell from 71,000 in 2004 to 35,000 in 2019. Work from a multi-institution team led by Duke University found that the quality of local news coverage is declining; increasingly, coverage produced by local news outlets has a low probability of being either original or locally relevant to a given community.

Broadcast news remains a small spark of hope in the changing landscape of local journalism. Similarly, while radio has faced some consolidation and challenges in continuing to produce new news, both remain viable local information sources. But both radio and broadcast tend to operate at a regional level as opposed to a local level, and as a result, there is a greater buffer in terms of audience and advertising to help these entities to persevere.

Another challenge facing both newspapers and broadcast stations is the increasing shift toward consolidation in the industry. In 2019, Gannett/Gatehouse Media owned 613 newspapers in the United States, and Digital First/Tribune owned 207 newspapers. Nexstar media group owned 42 local broadcast stations. Similar patterns exist in radio, where in 2021 companies such as Cumulus Media (445 stations) and iHeart Media (855 stations) own significant shares of the local news market. As the industry continues to face increasing competitive pressure, it is likely that trends of market consolidation will continue. Research shows that this ongoing trend of consolidation can help media companies to produce content more efficiently, but it also tends to result in a decline of local and original media content.

Given the ongoing decline of local journalism, it is increasingly important that researchers track the way in which changes to local news coverage impact communities. A number of large-scale studies have started to track the health of local journalism in the United States and globally. There is evidence that some communities are becoming news deserts, finding that their community no

longer has a news outlet covering their specific information needs. From 2004 to 2019, more than 2,000 local newspapers closed and more than 1,800 news deserts emerged lacking any dedicated local journalism outlet. A number of variables impact the emergence of news deserts. For instance, large cities employ an increasing percentage of professional journalists, and as a result, there is a lack of professional journalists working in small- and medium-sized communities. Other factors impact the emergence of news deserts, specifically when considering the nature of a given community.

Local Journalism and Community

With local journalism declining in many communities, there is cause for concern. Local journalism is part of the lifeblood of a given community. In 2012, the Federal Communications Commission established eight categories served by local journalism: emergencies and risks, health, education, transportation systems, environment and planning, economic development, civic information, and political life. Local newspapers have traditionally delivered the most focused and targeting local journalism content. Broadcast and radio stations tend to speak to a broader audience with few directly local stories. Consider, for instance, KARE 11 (NBC affiliate) in Minneapolis; the station's local news coverage focuses on Minneapolis, but there is usually at least one or two stories each night that focus on another region of the state. Thus, the coverage is not directly local, but it may cover local issues from time-to-time depending on where audience members live. Moreover, the composition of a given community impacts the probability that a community will have dedicated local journalism. For example, communities with a large percentage of underrepresented groups are also likely to experience a lack of local journalism, or a less robust local news media.

When there are declines in the production and consumption of local journalism, research demonstrates that there are correlated declines in the level of citizen knowledge, community engagement, and participation in elections. For example, local journalism within a given community provides a key channel for citizens to gain access to information about local elections for mayor, or for

school board. The same media outlets also provide citizens with information about key issues facing the town and school board. The loss of this type of media coverage leaves a significant gap in available community information. Furthermore, community coverage keeps citizenry aware of community events; this type of basic reporting is a key driver of community engagement, and the absence of this coverage leads directly to a decline in levels of community engagement.

Local Journalism and Democracy

Local journalism is inextricably linked with the growth and maintenance of a healthy democracy. Local journalism contributes to an informed citizenry; consumption of local news has been linked in research to increased participation rates in local elections.

Declines in the number of local journalism outlets in a given geographic region, hand-in-hand with declines in the quality of local journalism, has notable negative effects on local government. For instance, in communities where local journalism outlets have closed, research shows that there tends to be an increase in government costs. Local journalism outlets often occupy a watchdog function, holding government leaders accountable and ensuring transparency. There is also a decline in participation in local politics; at a basic level, local journalism keeps community members aware of political events within a community, and that awareness drives involvement. In the absence of that function, a decline in participation is likely to occur.

At the same time, there is evidence that local journalism is becoming increasingly partisan and polarized, following the pattern seen in national media. Hyperpartisan websites featuring local journalism have started to emerge, with the ownership and sponsorship of these sites left intentionally opaque in order to obscure underlying motivations. The rise of hyperpartisan websites can be harmful for a couple of reasons. First, these sites tend to focus on polarizing and often misleading news articles. Second, the influx of highly partisan content fosters a culture of distrust with regard to local journalism. In sum, there is a clear connection between local journalism, democracy, and civic engagement.

The Future of Local Journalism

As local journalism struggles to compete in the face of increased competition for audience time, declining advertising revenue, and for resources needed to produce local news such as talented reporters, the future of the industry remains uncertain. The future of local journalism is complicated by the rise of alternate forms of dissemination and production. Online news outlets, mobile news apps, and social media outlets each offer new forms of production and distribution for local journalism. In addition, algorithms underlying much of this technology promise to automate some aspects of local journalism production and distribution. At the same time, there is concern about the impacts of automating local journalism. For example, some producers of local journalism such as Gannett and Tribune have experimented with automation of the production of some content such as sports box scores and financial reporting. Researchers have raised additional concerns about the accuracy and the reliability of automated reporting. Furthermore, as algorithms are used to augment the production of local journalism, there is a concern that the increased use of such technology will replicate existing societal biases.

While some focus on concerns regarding technology and automation, others have turned attention to policy solutions to help support local journalism. For instance, the state of New Jersey recently established the Civic Information Consortium to award small grants to local news organizations with the aim of helping to support new business models. Similarly, a state commission in Massachusetts was recently established to look at policy actions that could be taken to help bolster local journalism efforts in the state. While the future of local journalism continues to remain in flux, technological developments and policy changes may help support new forms of local journalism. Regardless, it is clear that local journalism serves a critical function within modern society, but that the nature of local journalism will continue to evolve.

LONGFORM JOURNALISM

As of 2021, longform is a relatively recent name for a journalistic genre that goes by many names: literary journalism, narrative journalism, reportage, nonfiction, journalistic storytelling, and others. Stories of this format can be found in traditional publications such as newspapers, magazines, and books as well as on specialized online platforms such as longform.org or longreads.com, aggregators that curate stories from a variety of sources. The term *longform* emerged because some entrepreneurs and journalists were looking for a way to capture different kinds of nonfiction writing (e.g., narrative journalism, essays, historical documents, screenplays, book chapters) and make them available on tablets, mobile devices, and on the Web. While the label *longform* is new, however, the history of this genre goes back to the 19th century, and its characteristics both evolved and solidified over time. The following entry uses the term *narrative journalism* because it better describes the

constructed nature of this genre in that it emphasizes the combination of reporting (journalism) and narrative (aesthetic effects). Narrative journalism is a form of storytelling that relies on fact-based reporting and conveys information in the form of a story, foregrounding stylistic elements such as character, plot, descriptive detail, and point of view. The goal of narrative journalism is to create an immersive experience for readers, often eliciting strong emotions such as empathy and joy but potentially also outrage and disapproval. Whatever the actual intellectual and emotional engagement looks like, ultimately narrative journalism provides an opening for moral reflection.

It is important to note that the following discussion focuses on narrative journalism in the United States. While examples of longform storytelling in journalism can be found around the globe and illustrate a broad spectrum of journalistic and literary cultures, the genre of narrative journalism has a distinct American flavor and has become a standard to aspire to. Part of its success story in the United States is that, over time, a dense institutional and cultural network evolved, providing writers with incentives, best practices, and traditions to draw from as well as analog and digital platforms to publish on. That said, narrative journalism also has deep roots in Europe where its popularity ebbed and flowed over time. Moreover, the current media environment also created conditions for more and stronger international exchange among practitioners and scholars, leading to conferences and networks focused on the theory and practice of narrative journalism around the globe.

This entry first offers a brief history of narrative journalism, sketching its evolution from the 19th century to the present. Then the discussion shifts to reporting techniques and the mechanisms of gathering facts, the building blocks of nonfiction stories. The next section examines how narrative journalism uses literary techniques to create an immersive experience for its readers. The concluding section focuses on the role and significance of longform narrative journalism in the 2021 media environment.

Brief History

Narrative journalism as a cultural phenomenon had its beginnings in the late 19th century and

emerged in an era when literature and journalism were not yet entirely separated. In an age of accelerating industrialization, massive immigration and the nationalization of American life, journalism and literature turned their gaze to actual people and how they lived. It became important to describe the cities with their sights and sounds, social life in all its complexity and diversity. For instance, journalists and fiction writers were intrigued by the variety of immigrant lifestyles and often abysmal living conditions in urban neighborhoods. They were trying to make sense of the modern world, brought about by scientific innovation and economic expansion. Hutchins Hapgood and Jacob Riis were prominent examples of writers who ventured out as ethnographers and introduced a wider audience to the plight of the slums in New York City.

While early literary journalists such as Mark Twain and Stephen Crane easily switched between literature and journalism, the two fields were drifting apart by the early 20th century and journalism became its own professional practice with certain norms, values, and routines. As a result, literary techniques played a less prominent role for a while. Beginning in the 1930s, reporters began to see themselves as narrators again and advanced more subjective and interpretive forms of telling stories. Especially the *New Yorker* became a prime example of innovative writing, blending earlier literary trends of naturalism and realism. The magazine published a groundbreaking piece by John Hersey in 1946 when his story about the dropping of the first atomic bomb in Hiroshima filled an entire issue of the magazine. Another influential writer was Lillian Ross, who used literary techniques in her writings that ranged from profiles (e.g., about Ernest Hemingway) to the workings of big movie production.

Despite all these literary precursors, the reference point for most contemporary longform journalists is the so-called *New Journalism* of the 1960s. In the context of fundamental social, political, and cultural change, these journalists were applying literary techniques (cinematic writing, extended dialogue, point-of-view, and interior monologue) to journalistic works. Tom Wolfe, one of its earliest and most prominent proponents, argued that New Journalism offered readers not only a fully reported, objective description of events but also the subjective and emotional life of

characters, characteristics that would typically be more common in novels and short stories but not in journalism. But not only the style of the New Journalists differed from regular news writing. These reporters were interested in subcultures (e.g., Hunter S. Thompson's portrait of the Hell's Angels), cultural trends (e.g., Joan Didion's vignettes about California), the life of celebrities (e.g., Gay Talese's profile of Frank Sinatra, which has been often described as the best piece of literary journalism in the 20th century), as well as close-up depictions of political events (e.g., Norman Mailer's stories about the Democratic Convention in 1960 or the 1967 March on the Pentagon). Critics of the New Journalism alleged that its practitioners were mixing facts and fiction, undermining the truth claims of traditional journalism. However, as scholars pointed out time and again, the fluid character of narrative journalism has nothing to do with making things up but is rather a result of a range of literary elements that narrative journalists employ for the sake of enhancing the aesthetic, emotional, and intellectual experience of nonfiction stories.

While many literary journalists started out as newspaper reporters, they typically published their writing in magazines or books. Influenced by the work of these journalists, however, reporters and editors in U.S. newspapers began experimenting with narrative writing styles. The *Washington Post* was the first major newspaper that deliberately and systematically incorporated narrative techniques into its daily news production when it launched its Style section in 1969. During the 1970s, other newsrooms (e.g., *Los Angeles Times*, *The Philadelphia Inquirer*) were also experimenting with storytelling formats, but it was not until the end of that decade that the newspaper industry as such paid attention. In response to declining circulation numbers, the American Society for Newspaper Editors initiated efforts to improve writing and inaugurated writing awards in 1979. In the same year, feature writing was introduced as a category to the Pulitzer Prizes. By the 1980s, news organizations began pouring resources into the production of feature stories. They hired writing coaches, gave reporters more time to work on assignments, and expanded weekend editions by adding narrative stories. The Poynter Institute, then evolving as the country's leading training center for mid-career journalists, became

instrumental in promoting narrative writing at newspapers and, by the 1990s, other renowned training institutions such as the American Press Institute and universities (Harvard University, University of Missouri, Boston University) held workshops and conferences about the benefits of storytelling. By the beginning of the 21st century, a veritable storytelling movement had taken shape, expanding the genre in multidimensional ways across media and platforms.

The Art of Reporting

Before narrative journalists can employ literary techniques, they have to gather their material, which comes from thorough, in-depth, and often deeply personal reporting. To craft compelling stories, they have to develop specific research strategies and reporting techniques as well as cultivate self-reflexivity and emotional intelligence. Getting access to sources and earning their trust are the most important part because this determines whether a journalist will have opportunities to follow along for important events, take a look at personal documents, and ask probing questions. Since the emotional experience of characters is such an essential part of longform journalism, journalists have to negotiate the challenge of conducting intimate interviews with strangers they hardly know. They need to establish a bond quickly, assuring their interviewees that they truly care about their story. At the same time, reporters still have to do rigorous research and double-check information they have received. In addition, observation and being there when action is unfolding are key elements for impactful reporting, because gathering this kind of information allows reporters to craft dynamic scenes and evocative images. Narrative journalists often work like anthropologists or ethnographers, as they carefully record sensory information (what they see, hear, smell) and take detailed notes on what they observe happening around them. An extreme example of this kind of reporting is Adrian Nicole LeBlanc, who spent more than a decade reporting and writing her book *Random Family*, chronicling the life of a Puerto Rican family in the Bronx. Another demanding form of immersive reporting is going undercover. For his book *Newjack*, Ted Conover became a prison guard at Sing Sing in

New York and captured life in prison from his personal perspective.

Narrative journalists use the whole arsenal of journalistic tools to gather information. In his Pulitzer Prize-winning story “Guantanamo’s Darkest Secret,” New Yorker reporter Ben Taub told the story of Mohamedou Salahi, who was falsely detained as a terrorist by the United States in Guantanamo Bay. Taub combines direct observation, interviews, diaries, and ample contextual reporting about the U.S. war on terror with a personal profile that illuminates the complexities and political miscalculations of American foreign interventions. In a similar vein, Hannah Dreier of ProPublica addressed a structural problem, gang violence, by profiling a former gang member who talked to law enforcement about escaping gang life only to be detained by Immigration and Customs Enforcement and subsequently threatened by other gang members. She and her editors had to balance her source’s desire to tell his story with the threat to his life. The story “A Betrayal” was published in New York magazine without disclosing the character’s last name or showing his photo. Henry, the former gang member, wanted the story out and let Dreier read through years of messages on his phone. He also helped her make a glossary of Spanish gang slang so that it became possible for her to understand the coded text and voice messages he exchanged with other gang members. As this example shows, ethical challenges and moral decisions are intricate parts of reporting for narrative journalism.

The Craft of Writing

To create an immersive reading experience, narrative journalists use literary techniques and narrative conventions, stylistic effects that elicit aesthetic, emotional, and intellectual responses from readers. Consequently, these effects shape factual reporting material in distinct ways. A traditional news story answers the questions about who, what, where, when, why, and how. Narrative journalism takes each of these elements and fleshes them out into fuller narrative forms. As a result, journalistic storytelling includes characters (who), action (what), setting (where), chronology (when), motive/cause (why), and process (how). Fully developed, these elements are then assembled by the writer into the

basic story template: Someone (one or more persons) encounters an obstacle (e.g., social, psychological, political) and then overcomes (or fails to overcome) that obstacle, leading to either a resolution or an open end. This narrative construction of factual information is so powerful because it not only informs but actually gives form—orientation, time and space, logical connections, meaning, intention, and focus—to lives that inherently lack forms.

“It feels like a movie,” readers often say when they read longform journalism. That is because, as Christopher Wilson has noted, realism is a style that makes people forget it is a style. Stylistic effects create the illusion that readers are directly experiencing reality. Writers use literary techniques to conceal the constructed nature of the text. They show rather than tell. As a result, readers develop mental images associated with the descriptions in the text. These stylistic effects derive from different sources and play out in manifold ways, depending on journalists’ individual creativity, skills, and tastes. However, a key distinction is whether a story is told in first or third person. First-person accounts describe acts of personal witnessing and offer testimonies. In combination with thick observational data, they create a form of ethnographic realism. Often, the writer organizes them around the theme of a journey, a voyage, a personal revelation. Joan Didion is a master of this kind of storytelling. From her early writings about cultural changes in the 1960s to personal accounts of the grief of seeing her partner and daughter die within a short amount of time, Didion created intimate accounts of both societal change and personal suffering. Third-person narratives, on the other hand, tell stories from the fly-on-the-wall perspective, introducing a cast of characters and their relationships. The writer relies on an omniscient point of view, using foreshadowing and flashbacks as well as multiple locations. The third-person perspective can construct a world unto itself, transporting the reader into a different time–space continuum. This kind of realism can be ethnographic as well, but in this case, the writer discards the role of a personal guide and instead retreats into the background. The aforementioned story “Hiroshima” is a paradigmatic example for this kind of cinematic writing. Using an understated tone of writing, Hersey described the experience of the atomic bomb from the perspective of six characters on the ground,

relying on meticulously reported personal and sensory details that gave his depictions a three-dimensional character.

Longform and Digital Media

The current digital media environment created new opportunities for longform journalism and narrative nonfiction beyond the traditional forms of literary journalism. News organizations have increasingly embraced multimodal forms of journalistic storytelling that combine visual and written modalities for telling immersive stories. A groundbreaking example was “Snow Fall,” a multimedia story by *The New York Times* that won the Pulitzer Prize in Feature Writing in 2013. Combining text, video, and animated graphics, the story reconstructs how an avalanche buried a group of skiers in the state of Washington, killing three of them. Multimodal stories such as this are no longer the exception but common practice in leading news organizations. Longform journalism has also gained a strong foothold in the world of podcasts. Following the success of “Serial,” an investigative audio story in 12 episodes that was created by Sarah Koenig and Julie Snyder in 2014, a whole cottage industry of narrative journalism podcasts has sprung up.

As narrative journalism expanded and found bigger audiences, some critics assert that this genre panders to the lowest common denominator of human interest stories and is inherently flawed, because it neglects structural analysis of societal issues and prevents the juxtaposition of opposing viewpoints. Moreover, these critics contend that narrative journalism often produces trivial stories driven by a desire to please commercial interests, causing harmful effects for political life and public debate. In contrast, a number of scholars emphasize how narrative journalism is uniquely positioned to illuminate the domain of everyday life, situating personal experiences in social, cultural, and political contexts. As a result, they are able to show that, because longform stories are constructed differently than traditional news stories, they link the private sphere with public life, highlighting the small story that illuminates larger questions concerning the self, communities, and the human condition.

One reason why longform narrative journalism might resonate with audiences in the current media

environment is that this kind of storytelling complements information with emotionality without descending into sensationalism or infotainment (a combination of information and entertainment). Narrative journalists not only explore emotional experiences and subjectivities of individuals and groups but also put these emotional qualities in the center of their storytelling, challenging some aspects of objectivity (such as impartiality and detachment) as a traditional journalistic norm. On the other hand, acknowledging emotionality as part of professional journalism has expanded the repertoire of journalistic writing by capturing the breadth and depth of lived experiences through augmented objectivity.

LOS ANGELES TIMES

The *Los Angeles Times* has been part of the city of Los Angeles' fabric since 1881, shaping the development and mystique of the City of Angels. For

decades, the newspaper was led by the Chandler Family, serving to make the family politically powerful and rich. But the paper's editorial focus changed when the last publisher of the four-generation reign began investing in the newsroom staff, who began regularly winning Pulitzer Prizes. In many ways, Los Angeles is a journalist's ideal: It is home to Hollywood, cars, oil, and aviation, not to mention crime, strife, and natural disasters. The *Los Angeles Times* has published the work of well-respected journalists such as editorial cartoonist Paul Conrad (who was on U.S. President Richard Nixon's infamous "enemies list"), columnist Jack Smith, photojournalist Boris Yaro, writer Patt Morrison, music critic Robert Hilburn, and reporter Ruben Salazar, who was killed in 1970 while covering the city's Chicano antiwar protests and later honored on a U.S. postage stamp. This entry is about the history of the *Los Angeles Times* and its impact on city development, politics, and culture.

Early Leadership

A century after the founding of what would someday become the United States' second largest city, the *Los Angeles Daily Times* published its first edition on December 4, 1881, with a seven-column front page containing more advertisements than news. Nathan Cole Jr., a St. Louis newspaperman who came to Los Angeles intent on starting his own publication, was the paper's primary investor and served as its editor. Former *Sacramento Union* publisher Thomas Gardiner, who also invested in the startup, was its business manager. With just 11,000 residents in Los Angeles at the time, the newspaper quickly experienced financial difficulties, and ownership was turned over to their printers. A hundred miles to the north, *Santa Barbara Weekly Press* publisher Harrison Gray Otis saw an opportunity to assert himself into the fledgling, yet promising, Los Angeles with its mild climate, undeveloped real estate, and absence of strong labor unions. Otis sold that newspaper and bought into the *Los Angeles Daily Times*, initially becoming its editor and then by 1886, full owner and publisher. He shortened the paper's name to the *Los Angeles Times*, which he simply called the *Times*. Otis became involved in the budding business community, helping to

launch the Los Angeles Area Chamber of Commerce in 1888.

A veteran of many Civil War battles, Otis volunteered to fight in the Spanish-American War in the Philippines while his wife and son-in-law Harry Chandler kept the newspaper running. President William McKinley promoted Otis to the rank of brigadier general, an identity that stuck with him for the rest of his life. In an effort to attract residents and commerce to the area, the newspaper beckoned Midwesterners and Easterners with a mid-winter magazine touting the area's year-round outdoor recreation and Anglo residents. Using the newspaper to promote his pro-business and anti-union ideals ultimately increased his financial and political power.

Vacant land in the unincorporated San Fernando Valley to the north of Los Angeles was purchased by Otis, Harry Chandler, and other powerful businessmen (including a Los Angeles Water Board member) before the city announced its plan to build a 233-mile aqueduct from the northeast (Owens Valley, specifically) to Los Angeles. Using fear-mongering tactics, the *Los Angeles Times* compelled voters in 1905 to approve a \$1.5-million bond (equivalent to \$44.3 million in 2020) to buy land and water rights, followed 2 years later by a \$24.5-million construction bond (equivalent to \$723.6 million in 2020). Two years after opening the Los Angeles Aqueduct in 1913, the San Fernando Valley was annexed by the city, doubling the size of Los Angeles overnight and increasing the assets of the Valley landowners. As Los Angeles' largest landowner, Harry Chandler is widely considered to have inspired the villainous character in the 1974 film *Chinatown*, depicting California's water wars.

Otis's front-page vitriolic editorials influenced political decisions such as choosing union-free San Pedro as the official Port of Los Angeles rather than Santa Monica, the terminus of the union railroad. Provoked by Otis's incessant union bashing, union leaders retaliated by placing a suitcase full of dynamite near barrels of flammable printer's ink in an alley next to the *Times* building. The explosion in the early hours of October 1, 1910, killed 21 employees and injured more than 100 others. A suitcase containing dynamite was also found that night outside Otis's home as well as the residence of a Merchants & Manufacturers'

Association leader. (Otis was in Mexico at the time and both suitcases were removed before they could explode.) Brothers James B. (J.B.) McNamara and John J. (J.J.) McNamara, members of International Association of Bridge and Structural Iron Workers, were arrested and later pleaded guilty. Exactly 2 years after the bombing, the *Times* moved into a new building on the same site.

The Chandler Family

After Otis died in 1917, Harry Chandler took over as publisher, following in his father-in-law's footsteps by using the newspaper to wield influence and power. While publisher, Harry Chandler built the art deco, air-conditioned building at Broadway and First Street bearing the words, "True Industrial Freedom," that housed the *Los Angeles Times* from 1935 until the newspaper's move in 2018 to El Segundo next to Los Angeles International Airport. Despite the pro-business slogan, an attempt was made in 1944 to unionize the pressmen. The vote overwhelmingly failed, with *Times* management vowing to pay its employees better than union workers.

That same year, Harry Chandler died and his eldest son Norman Chandler took over as publisher when the *Los Angeles Times* was trailing its main competitors in circulation. Four years later, inspired by tabloids he'd seen while traveling in Europe, Norman Chandler launched the *Mirror*, an afternoon newspaper, to compete with William Randolph Hearst's *Los Angeles Herald-Express*. This resulted in a newspaper war with Hearst, which ended with an agreement in 1962 mandating the *Mirror* shut down on the same day Hearst closed its morning newspaper, the *Examiner*. Additional financial decisions resulted in the *Los Angeles Times* becoming the first general-interest newspaper to go public, accepting ads for alcoholic products, and attaining a forest products company and newsprint-producing facilities. Although still staunchly pro-business and right wing, the newspaper was starting its transformation.

Norman's wife, Dorothy Buffum Chandler, nicknamed "Buff," took journalism classes at the University of Southern California to learn more about the business. As her husband's administrative assistant, she called attention to the newspaper's coverage of women and the arts. In 1950, she

launched the newspaper's "Women of the Year" awards, which were even given to journalists who competed with the *Los Angeles Times*. As a well-placed philanthropist, she organized benefit concerts in 1951 to save the Hollywood Bowl and its orchestra and leveraged her societal position to raise \$19 million (equivalent to \$159 million in 2020) to help build the Music Center as a permanent home for the L.A. Philharmonic. The County of Los Angeles also contributed its share as part of the unique public-private partnership. The 3,156-seat Dorothy Chandler Pavilion, one of three performing arts centers at the Music Center, opened its doors on December 6, 1964, and frequently hosted the Academy Awards ceremony.

Editorial Change

The fourth, and final, Chandler to run the *Los Angeles Times* began his 20-year stint in 1960. Otis Chandler grew up wealthy, attending boarding schools and Stanford University. Competitive by nature, he was skilled at shot put and weight lifting and also enjoyed hunting and car collecting. In preparation for the top job, Otis Chandler had completed a lengthy apprenticeship, working in a variety of departments at the newspaper including the presses, newsroom, and business management. Norman Chandler's choice of his 32-year-old son to succeed him as publisher created a deep rift in the Chandler family. Norman's younger brother Philip, who at the time was serving as executive vice president of Times Mirror, was thought to be next in line as publisher. The conflict deepened a year later when the *Los Angeles Times* published an investigative series about the ultra-right-wing John Birch Society, which counted Philip Chandler's wife, Alberta, among its members. A tough front-page editorial signed by Otis Chandler himself only deepened the split.

Otis Chandler's legacy was his ability to bring respect and integrity to the newspaper, which he accomplished by hiring serious journalists, expanding the Washington, DC bureau and launching bureaus throughout the country and world. During Otis Chandler's two-decade run as publisher, the *Los Angeles Times* earned six Pulitzer Prizes, for coverage of the Watts riots in 1965, Vietnam War reporting by an international correspondent, exposing wrongdoing within the Los

Angeles city government commissions, and unsafe structural conditions at the nation's major dams, among other stories. (Despite the awards' existence since 1917, the *Los Angeles Times* had only won four Pulitzer Prizes before Otis Chandler became publisher in 1960.) Attention was also shown to local issues such as police brutality, traffic congestion, smog, and the plight of Latinos in particular. Otis Chandler left his position as publisher in 1980 to become chairman of Times Mirror Company.

No Longer in the Chandler Family

Tom Johnson, the first person outside the Chandler family to be publisher, stepped in after running an Austin, Texas, TV station and publishing the *Dallas Times Herald*. Johnson was publisher for 9 years, followed by David Lavenhol for 5 years and Richard T. Schlosberg III for 3 years. When Mark H. Willes, former General Mills executive and then-CEO of Times Mirror, took over as publisher in 1997, the pace of previous job-cutting and downsizing increased. Kathryn Downing, the first and as of 2020 the only female publisher of the *Los Angeles Times*, was named in 1999 but left after a year due to a controversy in which newsroom employees were used to write and produce content for a special advertising section touting the opening of Staples Center multipurpose arena.

In what was considered the largest acquisition in newspaper history, the Chicago-based Tribune Company in 2000 acquired Times Mirror in a \$8.3-billion merger transaction. For the first time in its history, the *Los Angeles Times* was no longer owned by a local company. During the next 18 years, the newspaper had eight different publishers, which added to declining employee morale. In 2007, Chicago billionaire Sam Zell bought out the Tribune Company, and the remaining Chandler family members sold their entire stake in the company. Zell took the company private and in December 2008 the Tribune Company filed for bankruptcy. Employees' confidence in management fell in late 2017 when then-publisher Ross Levinsohn and then-editor Lewis D'Vorkin, both new to their jobs, failed to back up reporters who wrote articles critical of local tax breaks given to the Walt Disney Company, which resulted in

Disney banning *Times* journalists from new film screenings for a short time. Not long afterward, in January 2018, journalists at the newspaper voted 248-44 to unionize in the wake of dissatisfaction with top management and many years of cuts that had shrunk the staff from more than 1,000 in the late 1990s to fewer than 400. The newsroom's first union contract was finalized on October 16, 2019.

The ongoing crisis at the *Los Angeles Times* improved when billionaire transplant surgeon and cancer drug inventor Dr. Patrick Soon-Shiong and his wife, Michele, in June 2018 bought the newspaper and the *San Diego Union-Tribune* from Tronc, the rebranded name Tribune used for 2 years until it changed to Tribune Publishing. Soon-Shiong, who paid \$500 million in cash and assumed \$90 million in pension obligation for both newspapers, promised to improve its finances and restore the *Los Angeles Times* to its former glory. Although the stability of the newspaper improved, it continues to deal with declining advertisement revenues, calls for a more diverse newsroom, and equal pay for female reporters. In September 2020, reporter Angel Jennings was named the newspaper's first assistant managing editor for culture and talent, a new masthead-level position, to oversee the newspaper's Metpro and internship programs to promote diversity, equity, inclusion, and access. Veteran journalist Kevin Merida was named the newspaper's 19th top editor in May 2021, making him the third person of color to lead the newspaper since it was launched in late 1881.

LUCE, HENRY ROBINSON

Henry Robinson Luce (1898–1967) was an American editor, publisher, and media entrepreneur. Before television became the country's primary source for information, news, and entertainment, Luce's publishing empire dominated much of the American media landscape. That empire began with *Time* magazine in 1923, which he co-founded with Briton Hadden. *Time* was the first publication to present the news in short, concise, and opinionated stories. *Fortune*, Luce's second magazine, was first published in 1930 and covered American business in a new way: by discussing the intersection of labor, management, and government. Luce's most popular publication, *Life* magazine, was first published in 1936. Its pictorial content presented audiences with images and ideas from around the world. *Life's* mission

statement claimed, “To see life; to see the world; to eyewitness great events . . .” It became Luce’s flagship magazine. *Sports Illustrated*, Luce’s fourth publication, began in 1954 and presented sports and sporting events to middle- and upper-class audiences. Although it struggled in its first decade, the magazine began making a profit by 1964 when advertisers began to understand and appreciate its content.

After reviewing Luce’s early year and career, this entry explores Luce’s major publications and his influence on the field of journalism.

Early Years

Luce was born in 1898 in Tengchow (now Penglai), China, where his parents, Reverend Henry (Harry) Winters Luce and Elizabeth Middleton Root, worked as Presbyterian missionaries. Of the four children, Henry was the eldest. While in China, Luce attended the British China Inland Mission School. When the family returned to the United States, Luce was sent to boarding school at the Cathedral Grammar School at Saint Albans in Hertfordshire, England. At age 14, he attended the Hotchkiss School in Lakeville, Connecticut, where he befriended classmate Briton Hadden, who would later become a partner in Luce’s media empire. Both boys, even though polar opposites in personality and temperament, were interested in journalism and news in Europe.

At 18, Luce was admitted to his father’s alma mater, Yale College in New Haven, Connecticut. At Yale, Luce and Hadden, who had also been accepted to Yale, excelled in their studies. Luce became a distinguished student and prize-winning writer, while Hadden won every campus election in which he ran for. Both men were selected into the Skull and Bones, a secret society of young men who pledged to help each other throughout their lives.

After graduation, Luce moved to Chicago and worked at the *Chicago Daily News*, first as an assistant to columnist Ben Hecht, and later as a general reporter. By the fall of 1921, with the post–World War I recession in full force, Luce was let go from his position.

In Chicago, Luce dated and later married socialite Lila Ross Hotz. The marriage produced two children: Henry (Hank) and Peter Paul.

After Chicago, Luce took a job at the *Baltimore News* where Hadden was already working as a reporter. At the *News*, Hadden and Luce made plans for a new publication, which later evolved into *Time* magazine.

The Beginning of *Time* Magazine

The idea for *Time* magazine was to provide a growing, educated audience small capsulized stories of the world around them. At the time, newspapers and magazines fell into two categories: sensationalistic or elitist. The newspapers of William Randolph Hearst and Joseph Pulitzer tended to sensationalize the news and pandered to working-class readers. In contrast, the more serious newspapers used formulaic prose, excessively long stories and the mechanical style of writing used by the Associated Press. *The New York Times* was an example of the latter. It exemplified formal language, conservatism, and stories about obscure political events, speeches, and press conferences. Luce and Hadden’s idea was to create a publication that was lively, vivid, and accessible to an increasingly diverse middle-class audience.

After a difficult and frustrating fundraising campaign, *Time* magazine was born. The prospectus for the magazine offered an organized breakdown of the day’s news, including national public affairs, foreign news, the arts, sports, and people. The stories would be short, under 400 words, and fit under sections such as books, theatre, music, education, religion, or business.

Although Luce and Hadden did not strive for neutrality, they presented a more progressive and modern version of the news. Both Luce and Hadden quit their jobs at the *News*, and by early 1923, the first issue of *Time* was published. They hired fellow Yale graduate Roy Larsen as circulation manager. Larsen built a base subscription list of 8,000 before the first issue was even published.

Although magazine subscriptions grew with each issue, the magazine did not turn a profit until 1924. In the summer of 1925, citing cheaper operating costs, Luce relocated the home office and printing operations to Cleveland, Ohio. Hadden disagreed and fought to return the magazine to New York. After finding a less expensive printer, *Time* returned to the New York. The magazine continued to thrive and by 1929 reported a profit of \$400,000.

After contracting a case of blood poisoning, Hadden died on February 27, 1929, at the age of 31. After Hadden's death, Luce became the sole leader of *Time*, taking control of the management, as well as the editorial slant.

Luce placed Hadden's cousin, John S. Martin, as the managing editor of *Time*. Luce then acquired most of Hadden's stock, which allowed him to have the majority shares of Time Inc. He became the controlling stockholder as well as editor in chief and business manager.

Fortune Magazine

As *Time* continued to flourish, Luce developed an idea for a business magazine called *Fortune*. At the time, the few business magazines available focused on promoting corporate ideas and beliefs. Luce's idea was a publication that focused on the people who ran and worked in the business world. Unlike *Time*, which was tightly structured, Luce was able to explore different ideas with regard to design and photography. He hired talented artists and designers to create elaborate and elegant covers and illustrations. *Fortune* used expensive paper and high-quality photographs, which made it difficult and costly to produce. Its high production cost was transferred to its readers at \$1 per issue. As desired, *Fortune* attracted affluent readers and was first published in February of 1930 with 30,000 subscribers and multiple advertisers.

The March of Time

The March of Time began as a radio show to help promote and advertise for its sister publication, *Time* magazine. Larsen, *Time*'s circulation manager, came up with the idea as a way to increase visibility in the new medium of radio. Although never profitable, *The March of Time* gave significant support to *Time* magazine. It also led into the more successful, *March of Time* newsreel, which opened in theaters across the country on February 1, 1935. The short films lasted from five to 15 minutes and played before feature films in movie theaters. Directed by young filmmaker Louis de Rochemont, the newsreels received a special Academy Award in 1936. The newsreels continued to be popular and financially successful until 1951.

Clare Boothe and the Beginning of Life

Luce met Ann Clare Boothe during a Condé Nast party in 1934. At the party, Luce and Boothe discussed intellectual topics and the idea of a new photography magazine. At 31, Boothe was an accomplished writer and editor and a divorced mother. By the end of 1935, Luce had divorced Lila Ross Hotz and married Boothe in Greenwich, Connecticut (see Figure 1). The magazine Boothe and Luce had talked about when they first met was *Life*, which would soon become one of the most popular American weekly, pictorial magazines of the 20th century.

Life was published for 36 years, from November 1936 to December 1972, and was Luce's crown jewel. *Life*'s mission, taken from its prospectus, was to record, document, and educate all

aspects of life. In the 1950s and 1960s, one weekly issue of *Life* was seen by more than half of the adult population of the United States, reaching more people than any television program at that time. During its first year, *Life* was said to have a pass-along factor of 17.3, meaning that, on average, more than 17 people would have read each copy. The magazine was also instrumental in the medium of photography. *Life*'s first picture editor, Wilson Hicks, described the magazine's unique combination of words and pictures as a photo story or essay. Each photograph would bring a different idea or point to the story, as well as each collection of pictures would help to support a theme, convey a mood, or deliver information in a way that one picture or written story could not. This made the magazine stand out from all the other mass circulation magazines, pictorial or otherwise. *Life* not only helped citizens learn about issues and events happening all over the world but also educated them with a visual vernacular of storytelling. The magazine turned Americans into consumers of a visual culture and customs and helped audiences see the world in visual terms.

The name *Life* had been Boothe's idea. It was the name of a former humor magazine that had fallen on hard times. Luce purchased the name for \$92,000. John Shaw Billings, an editor from *Time*, took over as managing editor, and Wilson Hicks became the magazine's photo editor.

The first issue of *Life* was incredibly popular, selling out everywhere. Newsstand copies were hard to find and selling for more than the cover price. The initial run of 250,000 issues was not enough for demand. It was also a financial disaster. Advertising rates were locked in for the first year, but as demand grew and production costs grew, losses quickly grew. After the first year and with the rise of advertising rates, circulation reached 1.5 million, more than triple the first-year circulation of any magazine in America at that time.

Margaret Bourke-White photographed the cover story for *Life*'s first issue on the Fort Peck Dam in Montana, the world's largest public works project ever undertaken in the United States. The photo essay intermingled photographs of workers in the small boomtown of Fort Peck with photographs of the dam. Over the years, *Life*'s photographers became some of the most successful and

prominent in the world. Photographers, such as Alfred Eisenstaedt, Robert Capa, Larry Burrows, Gordon Parks, W. Eugene Smith, and Carl Mydans, covered some of the most important events of the 20th century.

Life published its last weekly issue in December 1972. With circulation rates and advertising rates not keeping pace with its main competition, television, the magazine was no longer viable. It was revised as a monthly publication from 1978 to 2000 but did not have the resilience of first iteration.

"The American Century"

Luce was committed to his beliefs about America and was not afraid to use his publications to promote those beliefs. In the February 17, 1941, issue of *Life*, Luce published "The American Century" essay. The five-page essay was Luce's commentary on American life and the nation's uncertain relationship with World War II. It did not outwardly or explicitly call for an American declaration of war but, instead, called for a reverent commitment to righting the wrongs of the world. The essay encouraged thousands of responses from readers protesting America's involvement in the war. The essay was significant, not because America did enter the war, but because Luce was trying to redefine the way Americans viewed their place in the world: not as bystanders, but as major players in a larger, more complex political environment.

Sports Illustrated

Sports Illustrated, Luce's fourth magazine, was first published on August 16, 1954. It was popular with audiences but did not generate the financial profits anticipated. The magazine attempted to elevate the world of sports from just games people played into a powerful metaphor for the human condition. It covered the three most popular sports in the United States—baseball, football, and basketball—as well as more obscure sporting events such as horse racing, mountain climbing, scuba diving, and even baseball card collecting.

Although circulation rose year after year, advertising and revenue were slow to catch up. The cost of publishing the magazine far exceeded the original estimates. It was not until 1964, 10 years after its first issue, that *Sports Illustrated* became

profitable and one of the most influential sports magazines in the United States.

Luce's Legacy

On April 16, 1964, Luce announced his retirement as editor in chief of Time Inc., which, at the time, was reported to be the largest publishing business in the world. Luce died on February 28, 1967, in Phoenix, Arizona.

After his death, an article in *Life* magazine described Luce as "the most successful editor of his time, a great popularizer of ideas, a man who revolutionized modern journalism" (*Life*, March 10, 1967, p. 30). His magazines, *Time*, *Life*, and *Fortune*, as well as the newsreels *The March of Time*, helped to change the practices of American journalism. Luce's formula was to synthesize, condense, and capsule information into short, readable, and understandable news stories. His business practices, as well as his ideas for publications, fueled his empire and legacy as one of the first media entrepreneurs to incorporate multimedia. Many of his publications, assets, and ideas are still in existence.

After his death, the Henry Luce Foundation, established in 1936, became the beneficiary of his estate. It continues to fund college scholarships in the fields of art, Asian studies, theology, education, public affairs, and public policy. According to the foundation's website, it has awarded more than \$1 billion in grants.

MAPS IN JOURNALISM

Maps in news stories allow journalists to more clearly and accurately show the public the location of one or more areas relevant to a story than they would be able to do with words alone. Maps also add an illustrative element to a news story, enhancing its design and attractiveness, similar to how photos or videos do. This entry examines the function, history, creation, and latest developments in news maps.

The Function of Maps in Journalism

Maps in news can describe not only the location of a specific setting but also its shape, size, and neighboring locations. They can show the location of events, such as where a demonstration took or will take place; demographics, such as how many people live in different counties within a given state; weather patterns that display where a rain or snowstorm may hit; and a number of other newsworthy topics that would benefit from graphic illustrations. Maps in news often focus only on key elements related to the story being told—main streets in a local story, for example, instead of all streets and alleys. Such maps allow the public to relate to the story being told, as their goal is to situate the public to the news story.

Similar to the news media's goal of informing and educating people, maps in the media allow

the public to further develop their knowledge of geography, locations, boundaries, and relations within locations. They help the public to better understand the world socially and physically, turning ideas that can be quite abstract into more tangible concepts. Maps, including those used in news stories, help the public to see geographic relationships and thus understand not only “where” events take place but also “how” and “why.”

Maps can be used in news stories about nearby areas as well as those farther away, including other continents or areas across the globe. Often, international stories, or those relating to areas with which the news audience is not as acquainted, will have accompanying maps, giving the audience additional information to understand and relate to the events being described.

Maps in news are typically simple in content and symbolization, so as not to require specialized knowledge to understand them. At the same time, maps in the media can educate the audience about the geographic location of places, events, or societies with which they may be unfamiliar. Many Americans, for example, learned about Middle Eastern geography in the early 1990s from maps the news media used when discussing the Gulf War, and about Iraq and Afghanistan in the early 2000s, when discussing the U.S.-led invasion.

In the 2020s, technology has offered news outlets advanced tools to analyze data to create those maps, as well as to create more interactive maps.

Different technologies and platforms, however, have changed the way journalists create maps and how the public uses them.

How Maps Are Created

The process of creating a map starts when an editor identifies a news story where a map could be used. The editor then submits a request for a map to an infographics specialist. Such requests often include the following: the name of the reporter and/or editor in charge of the story, in case the infographics specialist has any questions; a synopsis of the story itself, giving the infographics specialist context for creating the map; and the expected width of the final graphic, in columns (e.g., one column wide, two columns wide).

When available, a news outlet may choose to use a map that a news wire service, such as Reuters or the Associated Press, has made available. When maps from wire services are used, they are often adapted to fit the space the publication allocated for the map or to match the overall style used by the outlet, including, for example, typography and color scheme.

Sometimes, however, news outlets choose to create the maps themselves. For example, if the outlet has professional knowledge of the technique and software, creating maps from scratch may be easier, faster, or cheaper than using one provided by a wire service. A news outlet may also create its own maps when a story is too local, with no widespread appeal, to warrant interest from a wire service.

In such cases, the infographics specialist starts their work by identifying the location or locations to be covered in the map. To ease or speed up the design process, many news outlets compile templates or libraries of maps of common locations (e.g., nearby neighborhood, city, state, country) and symbols (e.g., ones for highways, state roads, or interstates). This allows for quick reuse or adaptation into a subsequent news map.

When creating a map from scratch, once the location to be covered is defined, the infographic specialist uses an existing map as the basis for designing their own map. In the past, this was done by placing transparency paper on top of existing paper maps and tracing the desired area. Later, with the advances of computers and

scanners, paper maps were scanned, and the tracing done with a computer. With the advent of the Internet and online mapping tools such as Google Maps, infographics specialists most often use screen captures of the desired areas as shown on a mapping site and trace the desired areas using those images.

Such tracing is commonly done using a vector-based software such as Adobe Illustrator. Vector-based software allow for a more precise tracing, and for the map, once created, to be later resized—whether bigger or smaller—without losing definition or quality. In this way, maps can be easily adjusted, such as when the original space available for the map changes, when the map is to be used on another platform (e.g., on the news outlet's website or on social media), or when the map will be used in a different story at a later time.

Print maps typically include six main elements: an overall title; a lead, which further explains the area being covered or the reason for creating the map; the map itself; the source (where the original image of the map was found); a credit line, listing the name of the infographics artists who traced the map or the wire service that provided it; and a scale of the map. As in journalism in general, accuracy is crucial for designing maps for the news. Thus, infographics specialists not only are careful in the tracing of the map and its details but also make sure to include an accurate scaling ratio of the map as displayed, compared to the real size of the area. If, for example, the map created is 5 inches wide when printed, but covers an area that is 5 miles wide in real life, the scale would convey that each 1 inch of the map represents 1 mile in reality.

Weather maps are a staple of television newscasts, although such maps are also widely used online and in print—something that *USA Today* highlighted when the newspaper was first launched in 1982. Television news weather maps show weather patterns, including temperature or wind direction, and are often animated. Various companies provide software to create these maps, including Accuweather, Baron, and The Weather Company. These companies use specialized hardware, including radar towers and tracking systems, to generate real-time weather maps, predict near-future weather, as well as show recent patterns and movements in weather.

History

Maps, in general, have been around for thousands of years. The earliest sketches of land portrayals ever found displayed good hunting areas within mountains and rivers. Found in Spain in 1993, they dated back more than 13,000 years. The earliest world map ever found dates back to 600 BCE. Around 150 CE, Ptolemy developed a method of mapping the entire globe, using what is now called *longitude* and *latitude*. In the 1500s, with the rapid expansion of world powers through navigation, a number of regional and world maps were developed.

As Mark S. Monmonier tells in his seminal 1989 book, *Maps With the News*, American colonial newspapers used maps as early as the 1810s, showing how legislative districts were divided within a state. Printing techniques at the time, however, made adding maps to news stories complicated: The use of metal or wood blocks in printing made tracing the outlines of specific regions and adding letters to name and describe areas quite hard. By the late 1800s, new technologies in news printing, including photo and half-tone engraving, improved the quality of news images overall, as well as the quality and details possible in news maps. Printing quality kept improving throughout the 1900s, as new technologies were developed and, by the late 1900s, the development of computers, especially personal computers, allowed maps to be created electronically and to be easily adjusted, corrected, and reused. This led to a great increase in the number of maps published by news outlets.

Historically, conflicts were a strong incentive for the use and interest of maps in newspapers. Conflicts in Europe and throughout European colonies in the 1850s, followed by the American Civil War in the 1860s, encouraged the use of maps in American newspapers, including full-page maps. World Wars I and II once again increased the use of maps in American news, assisting the public with understanding the events taking place across the globe. Two of the most famous infographics artists of the time were Charles Hamilton Owens, from the *San Francisco Examiner*, and Howard Burke, from the *Los Angeles Times*. Both were known for their realistic drawings in their maps, including sketches of specific buildings and landscapes.

In the 1980s, journalists started integrating data analysis into map-making, using, for example, geographic information software to find trends and write stories, creating maps based on such information. The first and arguably most famous case of mixing data analysis and map-making was the *Miami Herald's* coverage of the destruction brought by Hurricane Andrew in 1992. Stephen Doig, a reporter from the paper, led a team of reporters that produced a 16-page special report. Using a number of maps along with the stories, Doig and his team showed not only what residents affected by the hurricane could do but also how “lax zoning, inspection and building codes had contributed to the destruction” the hurricane caused. The coverage led to a number of political resignations and earned the *Miami Herald* the Pulitzer Prize for Public Service. The newspaper's coverage is widely credited with encouraging other journalists and news outlets to use data analysis in their news coverage and map-making, and further embrace computer-assisted reporting.

Latest Developments in News Maps

Since 2000, a number of technological advances, including the development of new platforms for news dissemination, have brought a number of new opportunities for using maps in the news industry.

One such platform has been mobile media. With more people relying on their mobile devices (e.g., cell phones, tablets) to read and follow the news, as well as to find directions, news outlets have had to adapt their news to these new devices. On the one hand, this has created some challenges: While maps in print or on the web can be as large as necessary, on mobile devices, maps have to be constrained to predefined, often small sizes.

On the other hand, these news devices and platforms have enabled news maps to be interactive as well as informational. For example, because most cell phones have geotagging enabled—which tracks where the user is located at any moment—a number of news outlets have recruited the public to contribute information that can be added to a map. Similar to how the app Waze tracks traffic patterns, news stations can use information the

public provides along with their location to create maps for news stories. These maps may discuss, for example, current events (e.g., sites affected by an earthquake or tornado), or weather patterns, with members of the public submitting images from their location.

Advances in touchscreen technology have also made maps more interactive. Maps no longer have to be static: Users can scroll left to right, top to bottom, and see more information than that contained in the map's original dimensions. On television, weather journalists can use large, touchscreen monitors to bring up different areas or additional information to the map, while political reporters can refer to various maps with different polling information when covering elections.

The addition of augmented reality in news maps can add interest to maps. Augmented reality superimposes information with images from one's own cell phone camera, allowing the user to interact with the story. One can, for example, receive further info on a location associated with a news story by activating one's cell phone camera when in that location. However, thus far, such technology is scarcely used by the news due to a lack of associated hardware, lack of reliability, and additional time required to develop.

MARKETING

Marketing is the customer-oriented process of creating, pricing, distributing, and promoting goods or services. Over the years, marketing has evolved from its dedicated, process-oriented roots to become a distinct and integrated component that drives the output of most organizations. The American Marketing Association defines marketing as an organizational function and set of processes for the creation, communication, and delivery of value to customers and for the management of customer relationships in ways that can benefit the organization as well as stakeholders. This entry offers an overview of the origins and development of marketing, discusses the concept of marketing mix, and explains integrated marketing communications.

For news media organizations, marketing accomplishes three important and interrelated functions: (1) to identify and create, distribute, and promote their products and services to answer to the informational, educational, and entertainment needs of their audiences; (2) to market their products and services to advertisers and third parties;

and (3) to increase brand awareness and develop strategies to promote organizational growth.

Both journalists and marketing practitioners use media channels to deliver information to their audiences. This proximity, combined with the need for media organizations to actively compete in the marketplace, has blurred to some extent the differences between marketing and journalism yet at the same time, has diversified and modernized both fields. The advent of new communication channels since 1990 has made it even more difficult to draw a clear distinction, at least from an applied perspective. Social media and the Internet of things have further expanded the traditional meaning of marketing, especially when it comes to customer interaction and brand awareness. Organizations value and strive for supporting user-generated content. In an increasingly segmented media market, one where gatekeeping has significantly switched from an organizational to an individual level, social media influencers have become important players in the marketing arena.

These competing marketing forces continuously shape the journalist's world as the consumer's need for news and informational channels dynamically change. Traditional print media outlets, such as newspapers and magazines, major employers of journalists, initially slow in adapting to modern business models, have openly embraced marketing and strategic communication, which had significant repercussions (sometimes negative ones) on newsrooms and traditional distribution channels. Adaptation, scalability, flexibility, and consumer engagement are staples of successful (or surviving) media outlets. In search of new revenue streams, many media outlets have implemented paywalls (either as a subscription or pay-per-article). While research shows that paywalls have a detrimental effect on page views and the number of readers, it also suggests that this effect is dependent on the news content, with political, economic, and social news being less affected by pay-to-access barriers. As a result, news organizations may try to adapt editorial content to provide more articles that readers are willing to pay for—another indirect influence of marketing goals and readers' engagement in the editorial process.

Journalism deals with information and has a duty to present accurate, factual, and balanced reporting and analysis of news events to its

audience. Marketing, on the other hand, and especially the *promotion* component, deals with persuasion, with the need and duty to generate or increase brand awareness and brand recognition, increase product or service recognition and demand, and ultimately increase sales. Journalism at its roots is descriptive; marketing is persuasive. By the end of the 20th century, information had become a commodity requiring effective packaging to be attractive to its intended audience. As of 2021, content must resonate with audience needs and values, and users have the opportunity to directly engage with organizations about the marketing messages they put forward. According to some researchers, a company's customers' investment in social media on topics related to the company's brand, products, or services, and the social media engagement those customers hold, should be a metric included on any return on investment calculation.

News media organizations make a significant portion of their revenues not only by selling information to readers (or indirectly to viewers) but by selling audiences to advertisers. Thus, as news media compete for customers for their advertising time or space, they must provide a news product which, using marketing terminology, must be tailored to the needs of the business (advertising) audience, with a competitive price structure, and be adequately promoted. Thus, a conflict arises between the need to be objective, tell the truth, and inform and the need to have a profitable business model and play a part in delivering third-party marketing-driven persuasive messages to readers or viewers who seek the media product because of its perceived informational value.

Business entities, on the other hand, employ journalism techniques to enhance the appeal of their public relations releases, so they are more likely to be selected for inclusion in the news. Research conducted by Lynne Sallot and Elizabeth Johnson in 2006 estimated that about 44% of news editorial decisions in the United States are influenced by public relations practitioners. This is a significant figure that adds to the pressure news media get from their advertising clients. This relationship reflects the balance of power between journalism and marketing in news media organizations. As the second decade of the 21st century has shown, media outlets are not immune to

advertisers' ire and have sometimes bowed to this pressure, especially when doubled by public outcry. Journalists have been fired for comments that they have made on their social media streams, which run against the values of their news organizations. As pressure on news media from market forces increases, journalists have to walk a continuously thinning line between sound journalism principles, audience scrutiny, and coping with increasingly demanding organizational pressure to deliver a *sellable* product.

To respond to the demand of increased competition among traditional and newer news outlets, media organizations apply marketing principles not only to promote their products but to affect the basic core of how news and editorial content is written and collated. The trend in the 21st century is changing from "delivering information" to "making information resonate with the audience" or packaging news to best meet the needs and values of advertisers and consumers. Not only the product, but the distribution channels have changed as well—with web and social media playing today a fundamental role on how news organizations market their products. The change can also be seen with the increasing number of journalism schools now offering social media and marketing courses and teaching news and information from more of a market-oriented perspective. For the first time, in 2018, social media surpassed newspapers as the main source of news for Americans, according to a PEW research study. Across the world, there is large variance in using social media as a main source of news, mostly due to trust and reliability issues.

Origins

The development of marketing can be traced through two distinct dimensions, one academic and the other functional. According to a 1988 seminal work by Robert Bartels, the academic evolution of marketing went through eight decade-long periods, starting in 1900.

The early years to 1910, or the discovery period, saw the first marketing courses in American colleges and the first published reports on price and distribution of agricultural goods, a first in utilizing the scientific method to explore the existence and interaction of market forces. The

second decade of the 20th century, or the conceptualization period, focused on researching and understanding of basic marketing processes and institutions and the role of products in the market. The period of integration in the 1920s was a time of assimilation of knowledge from sales management and advertising, thus creating the premises for further development of marketing. During the 1930s (the development period), the first comprehensive marketing theories were postulated, and the *American Marketing Journal* was first published in 1934. The 1940s was a period of reappraisal, marking theoretical development, and evolution of marketing from individual processes to a more integrative and systematic approach. The following decade built upon previous development and saw a refining of marketing knowledge with new theoretical work and development of modern marketing perspectives. The main achievements of the period of differentiation during the 1960s were the incorporation of quantitative research methods into marketing research and the extensive development of marketing models. The period after 1970 was marked by a realization that, at any societal level, interaction between organizations and their stakeholders may profit from the implementation of marketing techniques; this period also witnessed the development of social marketing as a distinct component.

The early 21st-century development of communication technologies and the increased utilization of online social networks (with billions of users, no geographical boundaries, and intimate targeting potential) mark another period in marketing's evolution. To further underline parallels between marketing and journalism, the same determinants irreversibly influence the way consumers seek information: user-generated content, almost nonexistent 20 years ago, represents most of the media consumption of young people. Online social platforms, social video-streaming services, blogs, instant messaging, and the like are but a few of the new outlets where people seek news and may trigger a revision of the position of the journalist in society.

According to Robert Keith in 1960, one can segment the real-life business impact of marketing into three main periods. Some marketing scholars have questioned this historical perspective,

although it is widely accepted and included in many marketing textbooks.

The first period (product-oriented), triggered by the industrial revolution, extends to the beginning of the 20th century. In an age of newly discovered mass production means and high demand, the main orientation of organizations was to design new products and make these quickly available to the market. The sales-oriented period lasted from the 1920s to the early 1950s and was defined by the depression and all the market turmoil that it generated. Diminishing purchase power and an abundance of products generated a sharp decrease in demand, forcing organizations to concentrate on sales. This is the great era of personal selling and the golden age of advertising.

The marketing-oriented period of the past half century has been fueled by the idea that to be successful in a market saturated with products and sales pitches, one must deliver to customers what they want, how they want it, when they demand it. This reorientation of the functional marketing philosophy has consumer characteristics and present and future needs as the focal point, heralding the golden era of consumer research.

The Marketing Mix

At the core of any marketing plan resides the concept of marketing mix. This notion is as important for a news media organization as it is for a retailer or manufacturer. Although perhaps not perceived consciously, the marketing mix is what drives how news is gathered, packaged, promoted, and distributed, thus influencing company policies and procedures, and in the end, the journalist. Postulated by Harvard Business School professor Jeremy McCarthy in the 1960s, the marketing mix comprises four elements: product, price, place, and promotion, sometimes referred to as the *four Ps* marketing concept.

Product represents the actual specifications of the goods or services offered to the customer and the congruence of these specifications with the consumer's needs and values. Some of the most important variables to consider are brand and quality, functionality and design, packaging and warranty, and postsale service and support.

Price represents the perception of exchangeable product value for the customer and the process of

determining that value, including any financial incentives that may be associated with the actual selling process. Variables that must be considered include list price, gross, and point of sale discounts, financing and leasing options, and allowances.

Place denotes the process of bringing the product or service in contact with the customer, at the right time, in the best place, and in the required quantities. This component of the marketing mix is sometimes called *placement* or *distribution*. Variables that must be considered include locations and logistics, distribution channels, and market coverage.

Promotion refers to the process of informing, educating, and persuading selected target audiences about the organization, the product or service, and the brand. It uses a complex arsenal of research, communication tools, and strategic thinking. Some of the major variables to consider include message development, advertising and public relations, media plans, and media channels.

The Extended Seven Ps

The development of the service industry during the final decades of the 20th century influenced changes in the marketing mix, which needed to adapt to new market realities. A departure from the traditional four Ps marketing concept is the seven Ps marketing mix, which adds people, process, and physical evidence to the traditional blend.

People. This concept has dual significance. On one dimension, it stands for any representative of an organization or its affiliates, distribution chain representatives, or service personnel who comes in direct contact with the consumer and may influence the overall satisfaction or perceived value of a product or service. Additionally, it means the consumers of a product or service, for their perception of the value of their purchase may influence other potential customers. The increased use of online discussion groups during the first half of the first decade of the 21st century and the exponential increase in users of online social networks during the second half of the same decade underscore the power of individuals in influencing the marketing of a product or service. This is of extreme importance to the

journalist. As people migrate from traditional news media, accounting for how people seek news from the multitude of available outlets influences how a journalist prepares a story and how it gets distributed. Furthermore, the explosion of user-generated content is threatening the core of the journalism profession. A strong trend of personnel downsizing at news media companies has been evident since 2004, with much of the former content being replaced by news generated freely by news consumers.

Process. This concept, specific to the service industry, addresses customer satisfaction from the perspective of the service process itself. This approach takes into account the intermediary steps needed to obtain the desired outcome, especially as customer interaction may be significant during the process. From a journalist's perspective, this can translate into transparency and responding to consumer questions and comments.

Physical Evidence. This concept is a direct complement of the *promotion* found in the classical four P's model, and it is also particular to the service industry. Demonstrations, endorsements, testimonials, and case studies highlight the fact that a service is intangible and its value is hard to evaluate prior to its delivery. Nothing could be more relevant for a journalist, especially for stories posted online: The story has a comments and a ratings field; any reader can post a comment and leave a rating. This trend has been exacerbated in the second decade of the 21st century through readers' engagement practices—in which readers not only share the story with their social network, but often comment on the story itself—thus influencing the uptake and perception of the information.

Integrated Marketing Communications

As noted, communication is an integrant part of marketing. The diversity of media channels and audiences and interaction between the two have created the need for organizations to present a consistent and coordinated message. One can define integrated marketing communications as the process of coordinating promotion with all other marketing efforts to deliver the maximum

persuasive and informational impact on targeted audiences. Integrated marketing communications practitioners take advantage of any new medium that may enhance and/or focus the delivery of their message—such as the usage of highly targeted promotional materials via online delivery, database marketing, and direct engagement of consumers via social media platforms. The overall businesses' openness to communication, plus the need to interact with news outlets in a language and a format they understand, has created a need for experienced journalists—many of them currently working as communication officers or social media managers in businesses. Marketing and journalism both serve audiences' need for information, and their strategic congruence has assisted the survival of news media organizations during periods of economic downturn and increased competition.

MATERIALITY

Journalism, as a way of working and knowing, is often described as a pragmatic discipline. That is, journalists go to press with what Carl Bernstein and Bob Woodward have famously referred to over the years as “the best obtainable version of the truth.” Just what version of the truth journalists can obtain and the professional practices used to obtain it are facilitated and constrained by the material world. Among other things, a media organization’s physical proximity to events, the technologies, and tools available to journalists, the time limitations under which they work—in short, the realities of the physical environment—all have an impact on the news that’s produced. The physical environment likewise shapes audiences’ access to news and information in key ways, and the manner in which news spreads. Many traditions within social science and media criticism alike have focused on discourse and social processes as though they were unaffected by these physical realities—realities that scholars in countervailing traditions collectively refer to as *materiality*. This entry gives an overview of materiality as a concept within social theory and its particular intersections with scholarship on journalism.

Material Agency

If materiality is the notion that the physical environment must be contended with both by social actors and social theorists, closely related is the notion of *material agency*. Material agency is more specifically the idea that the material world exerts an influence in social systems and social interactions that compares in some ways to—and may be

an expression of—the influence of human actors. The word *agency* implies intentionality, which may appear initially problematic when applied to physical spaces and objects as opposed to people. But even things have tendencies and trajectories, if not actual intentions. Left to their own devices, the mold in the cellar will spread, the tree in the yard will grow, the hole in the roof will get bigger, tides will flow in and out cyclically, and so on.

When it comes to the intersection of such tendencies with social life, theorists and designers—following Don Norman—often speak in terms of *affordances* and constraints. An affordance is something an object enables you to do, irrespective of whether the designer may have intended it. If you’ve ever used a chair as a stepstool or opened a bottle on the latch plate of the nearest doorframe, you understand that the affordances of an object bear only a limited relationship with such intentions. Moreover, the affordances of an object are never absolute, but importantly intersect with the capacities of the user. A staircase can be a passage between floors of a building or an obstacle depending on whether or not the person approaching it is in a wheelchair.

Of course, affordances are only one side of a wider ledger, the other being constraints. Fences and railings, locks on doors, encryption placed on digital files: all of these are examples of technologies designed to constrain our actions in various ways. Moreover, they further demonstrate the relative nature of affordances—the lock on your front door is an affordance to you even as it serves as a constraint on potential thieves.

The role of technological design in enabling and constraining the actions of others has led to important discussions of what Langdon Winner famously described as “the politics of artifacts”—that is, the recognition that the built environment is constructed in ways that create and/or enforce power dynamics. Researchers tend to prefer the term “artifacts” to technology for the way that the former avoids artificial and often unhelpful distinctions between “high-tech” marvels and more seemingly mundane gadgets and environments, like padlocks or roadways, that do no less to enable, constrain, or choreograph our actions.

In one of Winner’s famous—and at times disputed—examples of political artifacts, low-hanging overpasses were placed over roads bound for the

coast with the unspoken intent of blocking the passage of buses and thereby preventing poor persons of color from visiting the beach. In another, automated farm equipment puts farm laborers out of work. In one example, the political impact of the design was seemingly the objective, while in the other it may have been an unintended consequence. In both cases, however, the fact that the result issues from a technological intervention rather than a law or executive action arguably short-circuits public debate and understanding of the underlying politics. This sidelong aspect of regulation through technology and architecture—that it can serve to constrain behavior while simultaneously avoiding the public scrutiny associated with overt politics—is a major focus and concern of many scholars of technology. Lawrence Lessig’s phrase “code is law” is often invoked to dramatize the manner in which artifacts, including digital ones, covertly regulate behavior.

Sociotechnical Systems

Of course, while the influence of the physical world—including tools and built environments—on social systems can be easy to overlook, overcorrections can be equally problematic. It’s not uncommon, particularly in popular discourses, to find accounts alleging that technology strongly influences or dictates human behavior—that television sets turned us into homebodies, for instance, or that mobile phones make us distractible. While technologies certainly play a role in influencing our behavior and social systems, the design and adoption of technologies are themselves the outcomes of social processes, and their role in our lives is interwoven with other influences like law and commerce. Accounts that overstate the influence of technology on behavior and social life are thus said, pejoratively, to be examples of “technological determinism.”

As Leah Lievrouw notes, more nuanced discussions of the role of technology in social systems emphasize mutual shaping, wherein the social processes behind technological design, use, and adoption are emphasized alongside, and seen as interacting with, any impacts of technological artifacts on behavior. Nuanced scholarship typically seeks to situate the influence of technology on social life within a larger constellation of

forces (law, commerce, social norms, scientific advancement, etc.) and often uses the term “sociotechnical systems” to refer to the interlocking nature of all these concerns. Common approaches to theorizing sociotechnical systems from the world of science and technology studies (STS) include actor-network theory (ANT), the social construction of technology, and Bryan Pfaffenberger’s notion of technological dramas. Lawrence Lessig’s notion of “four factors”—law, markets, social norms, and code/architecture—that regulate human behavior has also become an influential way of conceiving of the nature of sociotechnical systems.

Materiality in Journalism

Classic accounts of news work focus on the material constraints faced by journalists—how newsrooms have dealt with tight schedules, the limited availability of column inches and air time, and finite supplies of personnel and equipment. Such constraints have led to distinctive genres of news writing, such as the inverted pyramid, which make stories easier to cut down as necessary; to a focus on events that fit within the news cycle in which particular outlets operate; and to reliance on news subsidies and “diary events” to fill the news hole. Gaye Tuchman’s *Making News* and its description of the “news net” as a strategic arrangement of journalistic resources in space and time may be the classic example here.

At the same time, even as many classic accounts of news work offer up important concepts for considering materiality broadly, they often stop short of providing theories of technology in particular. The widespread uptake of digital technologies by audiences and newsrooms, especially in the late 1990s and 2000s, simultaneously upended traditional news routines and audience consumption habits, which in turn has led contemporary journalism researchers to focus considerable attention on understanding the social and organizational impacts of technological development and adoption.

Much of this work has involved updating and expanding upon classic accounts of the material conditions shaping news routines while importing and adapting conceptual lenses from the aforementioned field of STS.

Notable examples of such work include pioneering research by Pablo Boczkowski, eventually involving Eugenia Mitchelstein and other collaborators, that variously uses STS frameworks to explain technological adoption in newsrooms and applies affordance theory to discussion of news consumption; Nikki Usher's and Amy Schmitz Weiss's respective work on time, space, and place in contemporary journalism; C.W. Anderson's use of ANT to explain increasingly complex news ecosystems that have formed in metro areas in the age of the Internet as well as his exploration of the prehistory of data journalism, which frames journalists' use of documents using the language of materiality and artifacts.

David Domingo and his collaborators have also been leading voices in applying STS concepts broadly, and ANT in particular, to conceptualizing contemporary "news production, circulation and use," while at the same time cautioning against overemphasizing materiality in ways that minimize the agency of journalists themselves. Juliette De Maeyer has examined the ways in which materiality-oriented journalism research might push past methodological limitations often attributed to ANT, emphasizing the ways in which digital media retain traces, from hyperlinks to server logs, that allow for the mapping of associations between documents and technical artifacts that were often more difficult to establish in the pre-digital age.

In the world of broadcast journalism, Emma Hemmingsway has used STS concepts to explore the rise of "personal digital production"—the way emerging technologies have played into demands that journalists be multiskilled and work independently across multiple media. Rena Bivens has likewise applied the notion of mutual shaping to explain the influence of digital technology on evolving news routines, and Joshua Braun has adapted STS scholarship on technologically mediated networks into a methodological lens for exploring digital distribution of TV news and other media.

Moreover, as materiality has blossomed as a center of attention within journalism studies, a desire has emerged to push beyond the appropriation of STS concepts into the field and to emphasize new facets and framings of materiality within the world of news. Rodney Benson

has argued that accounts based in ANT favor thick description at the expense of explanatory value, for example, while Usher has emphasized how STS-focused accounts of the "objects of journalism" tend to privilege the utility of artifacts, paying relatively scant attention to the powerful role that affect, aesthetics, and emotional attachment play in our valuation of things. Seth Lewis and Rodrigo Zamith, drawing on Howard Becker's art worlds, have similarly drawn from literature outside of traditional STS founts, emphasizing the role of aesthetic and community standards in evaluating the worth of new digital objects.

Pablo Boczkowski, perhaps the earliest journalism scholar to draw heavily from science and technologies studies, wrote in a 2015 reflection that while STS may have provided an excellent springboard for the new "material turn" in journalism studies, many of the most pressing problems in the field will require new theoretical innovations and a broader integration of the field into the larger world of the social sciences.

McCLATCHY

Founded in 1857, the McClatchy Co. was one of the largest and longest-lived family-owned newspaper publishing companies in the United States

before it declared bankruptcy in 2020 and was sold to a hedge fund later that year. During their heyday, McClatchy newspapers championed liberal and progressive causes and charted the path for California to become a global economic and intellectual force for change. After 163 years under family control, the company was sold to New Jersey hedge fund Chatham Asset Management, which took control of its more than 30 newspapers nationwide.

The company's newspapers were known for high-quality journalism, winning a string of awards while under the leadership of C.K. McClatchy. Out of step with profit-driven corporate journalism, C. K. McClatchy led the company in the 1970s and 1980s with a philosophy that reflected his father, grandfather, and great-grandfather. They championed truth, editorial quality, and public service over profit and defended newspapers as bulwarks of democracy. The company's mission to hold those in power accountable and support its labor unions at a time when most chains valued profits over people made it a paragon of 20th century journalism. Its tumultuous transformation from the owner of financially threadbare newspapers to a publicly traded powerhouse reflects the turmoil of the U.S. newspaper industry, much of which is now in the hands of private equity and hedge fund managers far more focused on profits than journalism.

The story of McClatchy mirrors the newspaper industry's seismic shift in the late 20th century, when many newspaper companies switched from private to public ownership. This provided enormous short-term financial windfalls to investors. But focusing on short-term gains distracted publishers from designing profitable ways to deliver news through inexpensive digital pipelines. This entry discusses the company's founding and expansion and details its journalism in what was seen as its golden age under C.K. McClatchy. It then looks at changes in the company culture that led to tensions between labor and management, how the company's expansion was followed by the loss of advertising revenue to the Internet during the late 20th and early 21st centuries, and the company's collapse into bankruptcy and sale.

Founding and Expansion: James, Charles, and Eleanor McClatchy

Family patriarch James McClatchy, born in 1824, left Northern Ireland at 17 for New York City. He joined Horace Greeley's startup, the liberal New York Tribune, which emerged as the nation's highest circulation newspaper and dominant Republican voice, shaping national opinion during the mid- to late 19th century. The Tribune reported a gold strike on Northern California's American River in 1848. McClatchy took Greeley's advice to "go West young man and grow up with the country."

McClatchy sailed around the horn, shipwrecked in Mexico and traveled largely by foot to Sutter's Fort, the Gold Rush river port that became Sacramento. Starting in the summer of 1849, McClatchy worked a series of newspaper jobs. A year after the first passenger train rolled through Sacramento in 1857, McClatchy joined the *Bee* newspaper ousting its editor, Rollin Ridge, within a week of arriving.

McClatchy's first editorial articulated a vision the family held for more than a century: "The object of this paper is not only independence but permanence" (McClatchy, 2020). McClatchy vowed to fight for what's right "no matter how powerfully entrenched wrong may be" (Paterno, 2003). So many Sacramento publications opened and closed, the city was known as the graveyard of newspapers. All but two failed: The afternoon *Bee* and the morning *Union*. The *Bee* became a bastion of progressive reform, supporting average citizens against greedy corporations and corrupt lawmakers. The *Bee* uncovered local corruption, supported abolition, and fought hydraulic mining and developers' plans to subdivide Yosemite Valley, while the *Union* made celebrities of Bret Harte, Dan De Quille (William Wright), and Mark Twain (Samuel Clemens), sending Twain to Hawaii as a foreign correspondent in 1866. That same year, McClatchy bought a stake in the *Bee* for the equivalent of \$30,000 today. The investment paid off handsomely after the First Transcontinental Railroad joined the East and West coasts in Sacramento in 1869 and the city's population boomed.

For nearly a century, as California became a political powerhouse, politicians from local lawmakers to presidents courted the McClatchy

family to deliver votes. The family shaped the history and culture of Sacramento, beating back efforts to relocate the capitol, using editorial harangues to create a city of Victorian homes and miles of boulevards lined with shade trees.

When James died at 59 in 1883, the paper passed to son Charles as editor and older brother Valentine as business manager. Charles inherited his father's civic vision, championing collective bargaining, environmentalism, public utilities, women's suffrage, political independence, and abolishing the Electoral College. His brother Valentine publicly espoused nativism, eugenics, and anti-immigration laws aimed at Japanese, Mexicans, and Filipinos.

Charles and son Carlos bought out Valentine in 1922 to gain sole control of the *Bee*. They exposed Ku Klux Klan white nationalists secretly meeting in the Folsom Hills and launched the *Fresno Bee*. They acquired the Modesto News-Herald in 1927, renaming it the *Modesto Bee*, and five radio stations in Sacramento, Fresno, Stockton, Bakersfield, and Reno. While powerful California families the Chandlers and Hearst lived lavishly on the fortunes their newspapers made, the McClatchy family saw money as a way to strengthen journalism to protect the commonweal, publishing stories that led to dozens of libel suits. As Charles put it: "The *Bee* shall never be run for the counting house" (California Press Foundation, n.d.).

After the death of Carlos in 1933 at age 42 from pneumonia, Charles battled personal anguish and corrupt politicians. He assigned a reporter and Managing Editor Walter P. Jones to expose judicial and legislative corruption in Nevada. The series won the Pulitzer Prize in 1935, and the *Sacramento Bee* became the first California newspaper to win for meritorious public service. A year before his death in 1936, Charles asked his unmarried daughter Eleanor to return to Sacramento from New York City to become president of the company. He selected Jones as editor.

Trained in theater as a playwright, Eleanor had no publishing experience but proved adept at building the McClatchy brand during her four decades as company president. The company weathered the depression and diversified into radio and television broadcast channels and cable television. In the 1950s and 1960s, McClatchy newspapers supported California Gov. Pat Brown's

massive infrastructure expansion that provided free highways, free public universities, and a vast network to transport water statewide to expand agriculture and development in central and Southern California.

Jones maintained a long friendship with Earl Warren, a Central Valley high school graduate, who went on to become California's attorney general and then governor before serving as Chief Justice of the U.S. Supreme Court from 1953 to 1969. Warren's legal philosophy echoed the McClatchy family's mission to protect the rights of the nation's least advantaged. Considered one of the most influential thought leaders in United States history, Warren wrote majority opinions that protected free speech and the rights of people of color, the poor, and the disenfranchised, a philosophy shared by C. K. McClatchy, who succeeded Jones as editor of the three Bees in 1974.

C. K. McClatchy and the Golden Age

C. K., named after grandfather Charles Kenney, was the youngest of three boys of Carlos and Phebe McClatchy. Born and educated in Fresno, he graduated from Stanford University, served in the Army, reported for *The Washington Post*, ABC's Washington DC news bureau, and the *Sacramento Bee*, before becoming associate editor of the Bee papers. In 1958, he married Grace Kennan, daughter of Cold War architect George Kennan, with whom he had three children, Charles, Kevin, and Adair.

When Jones died in 1974, Eleanor appointed C. K. editor and named him successor in 1978. She died in 1980 with a trust that preserved McClatchy as a family-controlled independent newspaper company. C. K. deplored much of what he saw in corporate journalism, especially the many companies devoted "to be ever faithful cash cows for the owners," (Paterno, 2003) he said. C. K. instructed his executives to seek truth, editorial quality, and public service over profit and appointed veteran newsman Frank McCullough editor of the three Bees.

Born east of Sacramento on a ranch in Nevada, McCullough graduated from the University of Nevada and worked for United Press International. He reported and wrote hundreds of *Time* magazine cover stories, was managing editor of

the *Los Angeles Times*, and became Time-Life Southeast Asia bureau chief during the Vietnam War. C. K. appointed McCullough executive editor of the company's growing stable of newspapers in California, Washington, and Alaska.

C. K. and McCullough ushered in a Golden Age of journalism at a company so aggressive it had more than a dozen libel suits pending at one point. In 1976, four *Fresno Bee* staff members went to jail rather than reveal their source for a government corruption story. C. K. spent hundreds of thousands of dollars fighting legal battles that eventually led the state legislature to change the constitution to include a shield law protecting journalists seeking to keep confidential their sources or unpublished information. The three Bees investigated local and state politicians, schools, developers, the federal government, and organized crime. From 1978 to 1983, the *Fresno Bee* published more than 300 stories illuminating widespread corruption in the San Joaquin Valley establishment. The *Sacramento Bee* assigned a team to expose hunger in the state, an investigation that lawmakers cited to successfully raise the minimum wage.

Each Bee newspaper published the same editorial on the opinions page for state, national, and foreign affairs, thus strengthening the influence of the company's liberal voice. The *Sacramento Bee* added entertainment sections and a Sunday magazine, increasing sports coverage and staff size. Paying some of the industry's highest salaries, the company hired reporters and editors with national pretensions and degrees from Stanford, Harvard University, and the University of California, Berkeley, including best-selling author Pete Dexter. Reporters traveled the country and abroad on assignments—to Somalia, El Salvador, and the Philippines. The paper subsidized Dale Maharidge and Michael Williamson as they chronicled farm workers, illegal aliens, and the unemployed, tales that inspired a book and Bruce Springsteen's "The Ghost of Tom Joad." Maharidge and Williamson crisscrossed the country revisiting the people and places in the Depression-era Dust Bowl chronicle "Let Us Now Praise Famous Men," winning the Pulitzer Prize for Non-Fiction for their 1990 book *And Their Children After Them*.

The company invested in winning Pulitzer Prizes. Reporter Deborah Blum traveled the United

States to illuminate the issues and personalities behind highly controversial primate research and to produce a series of articles that also led to her 1994 book *The Monkey Wars*. Tom Knudson spent 8 months investigating the decision by the administration of President Ronald Reagan to deregulate and develop the Sierra Nevada. The 1991 series "The Sierra in Peril" illuminated unchecked air pollution, dying forests, poisoned rivers, vanishing wildlife, and soil erosion. Both Blum and Knudson won Pulitzers.

In the 1980s, the company had 25% profit margins thanks in part to double-digit increases in advertising revenues throughout the industry. From 1983 to 1986, McClatchy revenues increased almost 50% and net profits from \$6.9 million to more than \$45 million. C. K. took the company public in 1988 with controlling stock held in family hands. In a speech delivered, a few months before the sale, C. K. warned the next generation to reject corporate greed, group ownership, franchise journalism, and the false virtue of great size. He urged them to remain true to the company's mission to serve local communities and value public service over profits.

Within a year, C. K. died of a heart attack at age 62. McClatchy's new leaders, Erwin Potts and Gary Pruitt, did precisely what C. K. had warned against. Embracing modern corporate practices, they acquired so many newspapers the company eventually lost all its value, destroying jobs and the McClatchy family's fortune.

Change in Company's Culture

In the decade before he died in 1989, C. K. McClatchy and the family gradually ceded control of the company to Potts, then to protégé Pruitt. C. K. had hired Potts in 1975 from Knight Ridder Inc.'s *Charlotte Observer* in North Carolina to direct McClatchy's newspaper operations. Potts, a native of North Carolina, demanded total authority to change McClatchy's culture. Switching the Bees to morning delivery, he precipitated a battle between labor and management at a company that had historically championed unions. Amid the strike, Potts ordered workers to reclaim jobs or lose them. His enemies branded him a Southern strikebreaker. Less than 2 years later, in 1980, Eleanor McClatchy died.

Potts sold the company's electronic media, using the proceeds to acquire small California weeklies and out of state newspapers and invest in a paper mill in Spokane, Washington. He launched costly newspaper wars in Sacramento and Anchorage, Alaska, where there were still competing newspapers, and gained control of the company's newsrooms by urging C. K. to force the formidable McCullough to retire in 1985, a year after Pruitt arrived. By hiring editors and publishers loyal to him, Potts gained control of the newsroom under the guise of decentralizing power, giving business managers unprecedented power. With protégé and fellow Southerner Gregory Favre managing newsrooms, Potts and Florida attorney Pruitt remade McClatchy into a modern media corporation. The executive team broke labor unions, overpaid for newspapers, and spent millions on production plants, presses, modern glass and steel buildings, and luxury décor.

Amid the worst industry recession since World War II, Potts' compensation reached nearly \$1 million in 1991, while the company's net income fell to \$23.7 million, half its 1986 level. Guild members picketed the annual shareholders' meeting with little effect on Potts and Pruitt. They bought 13 more papers in Southern states with laws restricting unions, including six in South Carolina and one in North Carolina, Potts' previous employer *The News & Observer* in Raleigh. Retiring in 1996, Potts chose Pruitt to succeed him.

Pruitt went on another buying spree, boosting advertising revenue, defusing labor unions, and tightly controlling expenses. In 1998, he used debt to finance a \$1.4 billion deal to buy family-owned Cowles Media and acquire the *Star Tribune* in Minneapolis. Pruitt quietly reduced McClatchy's workforce 6.9% through attrition, producing record earnings in 2002 despite flat revenues. In January 2004, he bought the *Merced Sun-Star* and five other papers in California's San Joaquin Valley.

At the start of the 21st century, McClatchy journalism was heavy on features, sports, and projects and far less willing to battle big business controlling the advertising markets Pruitt wanted to dominate. Instead, Pruitt embraced the industry's latest trends to boost profit margins and appease Wall Street.

The Rise of the Internet, Bankruptcy, and Sale

In 2006, Pruitt purchased Knight Ridder Inc. for \$4.5 billion, an acquisition that led to \$2.5 billion in debt and likely set the stage for the company's eventual bankruptcy. The deal included 32 daily newspapers, making McClatchy the nation's second-largest newspaper chain after Gannett. Some analysts said Pruitt overpaid in the deal, which he financed with massive debt, jettisoning the company's respected digital division despite the Internet's growing prominence. Pruitt earned \$5.6 million in compensation that year, including a \$1-million bonus; he was regularly ranked the highest compensated CEO in Sacramento.

McClatchy's professional managers, like those in most corporate newspaper chains, bet on the past instead of the future. At the dawn of the digital age, rather than invest in developing strategies to deliver news through a cheap digital pipeline, the company spent billions acquiring legacy newspapers. Ad revenue collapsed as Amazon and Internet shopping replaced department stores; eBay and Craigslist pulled away classified ads, and online marketing obviated print. Old school executives like Potts and Pruitt failed to react quickly to rapidly changing technologies as they decimated traditional revenue bases.

To maintain profit margins, managers reduced the money spent to collect, process, and package the news, information, and advertising they sold. With cost structures 50% lower than legacy newspapers, digital competitors stole a generation of consumers uninterested in print. Forced to consolidate, hundreds of local newspapers died, creating news deserts nationwide. By 2018, two-thirds of U.S. daily newspapers were owned by companies with dozens of newspaper holdings, among the largest of which were in turn owned by investment entities such as hedge funds and private equity firms.

A week before he died in 2006, James McClatchy, a Stanford graduate and the last family member to actively manage the company, warned of the damage that would come if the company failed to fulfill its historic mission to better the Sacramento and San Joaquin valleys. Not long after, Pruitt sold the Minneapolis paper to a private equity firm for

less than half what McClatchy had paid Cowles Media 8 years earlier, sending the *Star Tribune* into bankruptcy in 2009. In 2014, the newspaper was sold to billionaire and former Republican state senator Glen Taylor. In 2011, William Ellery, the last son of Carlos McClatchy, died childless.

It took more than a century to build and less than a decade to destroy the McClatchy media empire and the family's fortune. By the time C. K.'s youngest son Kevin McClatchy stepped down as the Pittsburgh Pirates's managing owner to replace Pruitt as McClatchy's chairman in 2012, nothing could have saved the company. In 2012, Pruitt left the company in crisis and joined the Associated Press as chief executive. McClatchy went bankrupt in 2020, the stock plummeting to less than a dollar, down from \$700 a share the year before Pruitt's Knight Ridder acquisition. The main creditor, Chatham Asset Management, a New Jersey hedge fund, owned supermarket tabloids that included the *National Enquirer*, whose editor admitted to suppressing news about Donald Trump's extramarital affairs to influence the 2016 election.

Chatham bought McClatchy in a fire sale for \$312 million in 2020. By then, McClatchy had reduced its full-time staff almost 80% to 3,300 with plans to cut more through 2022, according to the *New York Times*. Pruitt and former Knight Ridder chairman Tony Ridder filed claims on behalf of retired executives to recover \$118 million in supplemental pensions including \$14.5 million for Pruitt and \$5.3 million for Ridder. The company compensated Chairman Craig Forman nearly \$6 million in the 2 years before Chatham acquired McClatchy. After the sale, Forman left to manage a private investment fund. Kevin McClatchy also departed, selling a 63-acre Pennsylvania estate for \$3.5 million. Chatham took control of McClatchy's 30 dailies in September 2020, appointed cannabis entrepreneur and Boca Raton resident Tony Hunter chairman, and severed all ties to the McClatchy family.

MEDIA CONGLOMERATES

A conglomerate is a corporation with holdings in a diverse range of businesses, which can include media companies. A media conglomerate, however, includes holdings only in media and is by definition diversified into more than one medium, such as print, broadcasting, and/or online. Conglomerates have been criticized for diminishing journalism in order to raise profits, for not allowing their news divisions the independence to report on their owners impartially, and for reducing the diversity of voices in media.

A media conglomerate can be privately owned or publicly traded. Most of the largest media conglomerates are publicly traded, having typically

raised the capital needed for their expansion by selling shares to the public. Most of the largest global media conglomerates are based in the United States, reflecting Hollywood's dominance of global entertainment industries. Because of a lack of limits on ownership concentration in the United States, three giant media conglomerates dominate—Disney, Comcast, and AT&T (see Table 1).

A trend at the millennium toward “convergence,” or multimedia ownership, then accelerated corporate consolidation, often to levels unsustainable in two major recessions that soon followed. A countertrend of “de-convergence” saw some media conglomerates (e.g., News Corp., Viacom) split into smaller, more manageable entities, but consolidation soon returned.

Diversification is a corporate strategy designed to reduce risk by spreading a company's investments across a range of businesses. A company may be diversified horizontally, vertically, or diagonally. Only a company that is diversified diagonally with holdings in multiple media is considered a media conglomerate. Research has shown that firms that diversify horizontally tend to be more profitable, while those that diversify diagonally tend to be more stable. A horizontally integrated media company owns multiple outlets of the same type. A publisher that owns more than one title is a chain, for example, while a broadcaster that owns multiple stations is a network.

A vertically integrated media company owns affiliates that contribute at different stages of the same core enterprise—for example, a newspaper company that owns a paper mill or a movie studio that owns a chain of theaters. A newspaper company or movie studio that owns a television station or network, however, would be diversified diagonally and thus qualify as a media conglomerate. When the Washington Post Co. bought *Newsweek* magazine in 1961, for example, it remained a publishing company. It did not become a media conglomerate until it diversified diagonally into cable television in 1982. It became a conglomerate when it bought the Kaplan education company 2 years later.

Growth of Media Conglomerates

Media companies were actually among the first conglomerates, well before conglomeration

Table 1. Largest Media Conglomerates

<i>Company</i>	<i>Country</i>	<i>Media</i>	<i>Value^a</i>
1. Disney	United States	Film, TV, radio, cable	\$220 billion
2. Comcast	United States	Telecoms, TV, film	\$209 billion
3. AT&T	United States	Telecoms, TV, film	\$203 billion
4. Sony	Japan	Film, music, TV production	\$95 billion
5. Thomson Reuters	Canada	News, TV, B2B	\$40 billion
6. Fox	United States	TV	\$15 billion
7. Viacom CBS	United States	TV, radio, film	\$17 billion

became popular as a business strategy in the 1950s. Newspaper publishers were some of the earliest owners of radio stations in the 1920s, but most soon divested their holdings in the new medium as incompatible with their core business. Some made a success of multimedia ownership, however, branching out first into radio and then into television. The *Chicago Tribune*, for example, bought a radio station in 1924, which it renamed WGN after its front-page slogan “World’s Greatest Newspaper.” It then founded a television station in 1946, which it called WGN-TV. Both broadcast from atop the newspaper’s Tribune Tower and also repurposed its content.

The Tribune Company became an exemplar of media conglomeration as it grew throughout the latter part of the 20th century, but it also came to serve as a cautionary tale of the perils that overexpansion could bring. As it grew into a major newspaper chain by buying titles across the United States starting in the 1960s, Tribune also expanded its broadcast holdings, often in the same new markets to take advantage of its content-sharing strategy, which became known as *synergy*. In 2000, Tribune acquired the similarly diversified Times Mirror Company of Los Angeles for \$8.3 billion.

In 2007, however, Tribune was taken over by real estate developer Sam Zell in a deal that would prove its undoing. Zell took on \$13 billion in debt to buy out other shareholders and take the Tribune Company private. An economic downturn

soon dropped advertising revenues sharply, leaving the company unable to service such a massive debt. It filed for Chapter 11 bankruptcy protection in 2008 and went through a 4-year legal battle for control. It emerged from bankruptcy in 2012 owned mostly by private equity firms, or hedge funds, which had acquired much of the distressed company’s debt at deep discounts. Tribune then split into separate publishing and broadcasting companies. The newspaper chain was renamed Tronc (for “Tribune online content”) in a 2016 rebranding intended to emphasize a new digital orientation, but the corporate name reverted to Tribune Publishing in 2018. Tribune Media, which held the conglomerate’s broadcasting assets, was acquired for \$4.1 billion in 2018 by Dallas-based Nexstar Media Group, which thus became the largest owner of U.S. television stations.

Other media companies similarly diversified and grew, driven by economies of scale that reduced their average costs the larger they got, economies of scope from sharing content, and cross-promotion strategies. The giant Thomson Corporation began in the 1930s with radio stations and newspapers in Canada and then expanded into the United States and the United Kingdom. It secured a lucrative license for Scottish TV in 1957, which allowed it to buy the prestigious *Times* of London in 1966. Having sold off most of its media holdings by the millennium except for *The Globe and Mail* national

newspaper in Canada, it then acquired the global Reuters news agency in 2008 to form Thomson Reuters.

Magazine publisher Time Life expanded into book publishing in 1961 and then into the music business in 1967. Its parent company Time Inc. merged with movie studio Warner Communications in 1990 to form Time Warner. It merged again in 1996 with the Turner Broadcasting System, which owned cable companies, the satellite “superstation” TBS, and cable channels such as CNN and HBO.

Times Mirror diversified from its original *Los Angeles Times* into book publishing in 1962 and magazines starting in 1969. By 1983, it had also acquired numerous other major dailies across the United States, including *Newsday*, the *Denver Post*, *The Dallas Times Herald*, and the *Hartford Courant*. It also began to acquire television stations in markets such as Dallas, St. Louis, and New York starting in 1970 and then added cable television companies in Phoenix and San Diego.

The Walt Disney Company expanded from its original cartoon studio and theme park into movie and television production in the 1950s. It founded the Disney Channel on cable television in 1983 and further diversified by buying a book publisher and a record label in the 1990s. It bought Miramax Films in 1993 and 2 years later paid \$14 billion for Capital Cities/ABC, which included the ABC television network and cable sports channel ESPN. While media conglomeration grew in the 1990s, its popularity accelerated under a new model of media ownership almost as soon as the millennium dawned.

Criticisms of Media Conglomerates

Conglomerates and media conglomerates that own news media companies have occasionally been criticized for not allowing their news divisions the independence needed to cover their parent company and its other divisions impartially. They have also been criticized for cutting resources for news divisions at companies they acquire to boost profits. A major criticism of media conglomerates has been that they reduce the diversity of voices in society by increasing media ownership concentration. In his 1983 book *The Media Monopoly*, Ben Bagdikian counted 50 media companies that then owned

most (i.e., more than half) of U.S. media outlets. He predicted that if the trend to corporate consolidation continued unchecked, only one conglomerate would own most of the country’s media by the year 2000. Bagdikian revised his count through multiple editions of his book, to 29 by 1987, and to 20 by 1993. In an updated book retitled *The New Media Monopoly* and published in 2003, there was not one owner of most of the country’s media, as originally predicted, but five. That included the German company Bertelsmann, which was the largest publisher of English-language books in the world and also owned major U.S. holdings in magazines and music.

Regulation of Media Conglomerates

Concerns over the increased power and influence of growing media conglomerates, which started in the early 1970s, prompted the U.S. Federal Communications Commission (FCC) in 1975 to prohibit the issuing or transfer of television station licenses to any owner of a newspaper in the same market. Existing cross-media ownership, such as that of WGN-TV by the Tribune Company, was allowed to continue under a grandfather clause, except in cases of market dominance. In Canada, the 1981 report of a Royal Commission on Newspapers warned strongly against allowing cross-ownership. The governing Liberal Party quickly banned it, but the prohibition was allowed to lapse in 1985 by a new Progressive Conservative government. In Australia, growing media ownership concentration, especially in the hands of newspaper mogul Rupert Murdoch, prompted the Labor government there to ban cross-ownership in 1987. Concerns over growing media conglomeration even brought legislation in the United Kingdom, where television had long been dominated by the BBC public broadcaster. A 1990 Broadcasting Act limited newspaper ownership of the ITV network, which had been established in 1955 as the country’s first private TV broadcaster.

Media Convergence

The advent of the World Wide Web in the mid-1990s, the spread of personal computers, and the development of web browser software made

Internet adoption widespread by the end of that decade. This prompted interest among media companies in diversifying into online media. Most were unsure how the Internet would develop but believed it was the way of the future. Start-up Internet companies such as America Online grew by offering online access and web hosting. The merger of America Online and Time Warner in January 2000, just weeks into the new millennium, created the multimedia giant AOL-Time Warner with a market capitalization (total share value) of \$241 billion. Due to the dot-com bubble that inflated the share price of digital companies in the late 1990s, however, America Online shareholders received 55% of the new firm despite Time Warner owning most of the assets. The AOL-Time Warner merger created enthusiasm among media owners for diagonal diversification, with carriage companies seeking content companies to team up with, and legacy media looking for digital partners with which to navigate the online future. Many countries, however, banned or limited the diagonal diversification of media. Companies pressured governments worldwide to ease or lift cross-ownership restrictions, and most did. Australia dropped its prohibition on newspaper-television cross-ownership in 2006, and the United Kingdom also eased its limits. In the United States, several attempts were made by Republican administrations to drop or loosen the FCC's cross-ownership ban, including in 2017 by President Donald Trump, but each time it was blocked in the Senate or in court. In 2021, however, the U.S. Supreme Court unanimously reversed a decision of the U.S. Court of Appeals for the Third Circuit that vacated the changes, thus reinstating the FCC's decision to drop the prohibition.

One country that had no limit on media cross-ownership was Canada, which had dropped its brief ban in 1985. Canadian media were thus reshaped by three multimedia mega-mergers before 2000 ended, and the result was devastating. First, the CTV network was bought by telecommunication giant Bell Canada, which later in the year partnered with *The Globe and Mail* national newspaper to form Bell Globemedia. Canwest Global Communications, which owned the Global Television network, then bought the country's largest newspaper chain, Southam Inc. Quebecor, then the world's largest

printing company, which had recently bought the Sun Media newspaper chain, bought Groupe Videotron, a multimedia company that included cable television, cellular telephony, and the TVA network. The convergence experiment began to collapse in 2009, however, when Canwest Global declared bankruptcy due to debt and its newspaper and television divisions were auctioned off separately out of bankruptcy. CTV and *The Globe and Mail* dissolved their partnership voluntarily as unworkable the following year, and Quebecor sold Sun Media in 2014 to Postmedia Network Inc., which had been formed by Canwest Global creditors and bond holders, mostly U.S. hedge funds, to take over the former Southam newspapers.

From Convergence to De-Convergence

Convergence fell out of favor as a media business strategy after the dot-com bubble burst in 2001, and media conglomeration thus began to wane. AOL-Time Warner's share price fell from a high of \$55 in mid-2001 to \$8.70 on July 25, 2002, and it became the poster child for digital overexuberance. The company dropped AOL from its name in 2003 and sold the division to Google in 2005.

The trend in media ownership instead became one of de-convergence. Viacom, which owned cable television holdings and the movie studio Paramount Pictures, spun off its CBS network into a separate company in 2005. Belo Corporation split in 2008, with one firm owning the *Dallas Morning News* and the other owning its 50 TV stations. Even Murdoch's global giant News Corp. split in 2013, with one company owning its newspapers and book publishing divisions, and the other owning its TV networks and movie studio. Gannett, which had long owned the largest U.S. newspaper chain, split in 2015 by creating a new company called Tegna to own its 50 TV stations.

The trend began to reverse again, however, and increased conglomeration was seen when AT&T bought Time Warner in 2016 for \$108 billion and renamed it WarnerMedia. In 2017, Disney bought 21st Century Fox, News Corp.'s former entertainment arm. In 2018, U.S. cable giant Comcast paid \$39 billion for Sky, Europe's largest satellite broadcaster. In 2019, CBS remerged with Viacom to become CBSViacom.

Financialization of Media

The trends toward concentration, conglomeration, and convergence of media ownership were stages in the phenomenon of “financialization,” in which news media ownership became a means to make profits rather than of informing audiences through journalism. This trend, which was also seen in other industries, went to another level after the Great Recession of 2008–2009. Many converged media conglomerates that had become overextended with debt, such as Canwest Global and Tribune, were acquired out of bankruptcy by hedge funds, which had bought up their debt on the bond market, often for pennies on the dollar. By 2014, hedge funds owned six of the 10 largest U.S. chains and the two largest in Canada. GateHouse Media, which was owned by the hedge fund New Media Investments, acquired 200 newspapers between 2013 and 2018 to become the second-largest chain in the United States, and then paid \$1.4 billion for Gannett in 2019. Hedge fund owners cut costs mercilessly to milk newspapers of their remaining profits, mostly by laying off journalists. This created so-called news deserts, bringing calls for government intervention to help create a new nonprofit business model for journalism.

MEDIA CRITICISM

When it comes to the news media, everyone's a critic, especially in the 21st century, when it is possible to share one's criticisms with the world via social media. But finding fault with society's messengers goes back to ancient times. As the Greek playwright Sophocles noted in the 5th century BCE, “No man delights in the bearer of bad news.” Writing in the 2nd century CE, the historian Plutarch reported that Tigranes, the king of Armenia, chopped off the head of a bearer of bad tidings and would listen to “only those that flattered him.”

Politicians have sought to discredit news about themselves ever since, pointing to errors, overreliance on anonymous sources, and what they see as an emphasis on the negative as evidence that news reports are unreliable, biased and, increasingly, “fake.” But not all attacks on the news media are self-serving, and not all attacks on the news media come from politicians. For that matter, not all dissections of the news media are attacks. While criticism is often thought of as synonymous with fault-finding, there is also a sense in which criticism is simply analysis of both strengths and weaknesses, as well as of process—the occupational traditions that dictate how a work of journalism gets made. Such analyses are usually but not exclusively found in the pages of scholarly books and journals and can take the form of seeking answers to such questions as How do journalists decide that an occurrence is newsworthy? How is information about that occurrence obtained? How is the information obtained then shaped for presentation to the public? This entry

discusses media criticism in both its fault-finding and more analytical senses.

Continuum of Criticism

Just as a film critic can pen a glowing review of a movie or a bravura acting job, a news media critic can find much that is praiseworthy in an individual work of journalism or in the performance of the news media as a whole. Still, most media critics, like most journalists, are meliorists. That is, just as journalists call attention to the problems of the world in the belief that knowing about the problems is the first step in solving them, media critics believe in the importance of good journalism and therefore call attention to journalism's shortcomings in hopes that journalists will hold themselves to a higher standard in the future. Of course, when media critics take fiendish pleasure in dipping their pens in poison ink, it may be hard to see the meliorism behind the glee. But even the most gleeful critics—and the comedians of late-night television can be counted among those offering a running commentary on the foibles of the news media—are trying to shame or prod journalists into doing a better job.

The continuum from nasty to constructive press criticism reflects vastly divergent views of the profession of journalism. Looked at through one lens, journalism is one of the pillars of democracy. According to this view, those who follow this noble calling are society's truth tellers, charged with the sacred responsibility of supplying the public with the information it needs to participate in the governance of nation, state, city, and self. Looked at through another lens, journalists are little better than circus sideshow barkers, trying to entice the public to spend a dime or a dollar to gawk at some oddity that may likely be an elaborate hoax.

This much is plain: Journalists, like all human beings, make mistakes. They can be careless, lazy, and gullible. They can also be guilty of poor judgment, at least in the eyes of those who disagree with their judgments. Because all their work is made public, their flaws, real or imagined, are there for all to see and for critics to point out. Journalistic errors are further magnified by what can be thought of as tip-of-the-iceberg thinking—the tendency to cite any instance of sloppy

reporting as evidence of a widespread culture of irresponsibility. This tendency, understandably, once made editors skittish about publishing corrections: Why call attention to your own mistakes? In more recent decades, editors decided that honesty might be a better policy than arrogance.

Perhaps the most common form of media criticism can be thought of as “Monday morning quarterbacking.” Just as in American football, where a disastrous decision by a quarterback under extreme pressure from hard-charging defenders can later be questioned by professional analysts and amateur fans who are not under such pressure, press critics can, at their leisure, pick apart the stories crafted by reporters who produced them under extreme deadline pressure. While fair-mindedness may be in short supply among Monday morning quarterbacks, it can be found in what might be thought of as a report card on media performance, in which the critic hands out grades that reflect both what journalists did well and what they did poorly in their coverage of a given event.

For a reliable guide to all the failings for which the news media has been criticized, one can look to the Code of Ethics of the Society of Professional Journalists. The code calls on journalists to be accurate, fair and thorough, among other provisions, which means that sometimes journalists are neither accurate, fair nor thorough. Implicit in each iteration of the code, beginning with the first one, developed in the 1920s—and in efforts to articulate a set of guiding principles for the press, as the Hutchins Commission (Commission on Freedom of the Press) did in the 1940s—is the belief that news organizations are more than for-profit businesses: They have a responsibility to provide citizens of a democracy with the information they need to be self-governing.

The four sections of the latest version of the Code of Ethics of the Society of Professional Journalists, adopted in 2014, are titled “Seek Truth and Report It,” “Minimize Harm,” “Act Independently,” and “Be Accountable and Transparent.” In over-relying on official sources, reporters may fail to “give voice to the voiceless.” In their enthusiasm for a good story, they may fail to consider the impact that story will have on the lives of the people they are reporting on. Under pressure from

associates or their own supervisors, they may show favoritism. All such lapses make them vulnerable to critical censure.

Criticism of the news media occurs on several fronts, all of which may overlap:

- News organizations are businesses.
- News organizations are error-prone.
- News organizations have political agendas.
- News organizations are bastions of naïve empiricism.

News Organizations Are Businesses

To the extent that news is a product designed to be sold to consumers, the quality of that product can be compromised by financial concerns. Delivering news costs money. And however passionate the owners of news organizations may be about informing citizens about the world they live in, they don't just want to cover their costs. Like all business owners, they want to turn a profit.

Throughout the history of journalism, the profitability of news organizations has rested on the sale of space (in the case of print journalism) or time (in the case of broadcast journalism) to advertisers. An advantage of this business model is that relying on advertising as their main source of revenue has enabled owners to offer news to the general public at an affordable price.

That advantage is offset by two disadvantages: First, it makes news organizations vulnerable to economic fluctuations: If advertisers are making less money, they may cut their advertising budget, which could force a newspaper to reduce its number of pages, reduce its number of employees, and/or devote its diminishing resources to news that takes less time or money to produce. Any of these measures or any combination of these measures can result in a reduction in the quality and quantity of news the organization is able to provide to its audience.

The second disadvantage of the advertising model is that it can compromise a news organization's independence. Dependence on advertising revenue can lead a news organization to offer coverage of an advertiser that is more promotional than newsworthy, or to soften or ignore negative news about an advertiser. The need for advertising revenue can also tempt news organizations to

accept ads designed to look like news stories, thus blurring the line between the two kinds of content.

Critics have long contended that the advertising model needs to be replaced with a way of generating income that is less fraught with potential conflicts of interest and less vulnerable to economic downturns. The search for alternative funding mechanisms—such as taxpayer dollars—has grown more urgent in the 21st century as both circulation and advertising revenues have dwindled as readers have gravitated toward free online sources of information and advertisers have found alternate vehicles to promote their products and services.

Another business consideration that has drawn fire from critics is the temptation to sensationalize—that is, to exaggerate the importance of a story, to add or exaggerate details within a story, and to rush a story to publication before all the information has been verified. In the days when newsprint was dominant, critics would accuse news organizations of playing fast and loose with the facts just to sell more papers. Today, critics accuse news organizations of playing fast and loose with the facts or substituting light “infotainment” for more hard-hitting (and expensive) investigative journalism to generate more clicks or page views.

Finally, critics have voiced concerns about both the growing number of news organizations that are owned by large corporations and the shrinking number of corporations that own news organizations. There was always the potential for family-owned news outlets to allow the political, business, or personal interests of their owners to dictate or influence news coverage. Corporate ownership raised additional concerns: about the pressure for short-term profits taking precedence over the organization's long-term reputation for integrity and excellence; about the corporation using the news outlet to promote its other holdings (think of a news magazine and a movie studio owned by the same company and the magazine putting the opening of a new film from that studio on its cover); and about the concentration of ownership in very few hands reducing competition among news organizations, resulting in less aggressive reporting.

Robert Benchley sounded the alarm about several of these trends in his “Wayward Press”

column in *The New Yorker* magazine, which ran from the late 1920s through the 1930s. A. J. Liebling followed suit when he took over the column in 1945. So did George Seldes in his book *Lords of the Press*, published in 1938.

In *The Media Monopoly*, published in 1983, Ben Bagdikian reported that ownership of most media organizations was concentrated in the hands of 50 corporations. In an updated version of the book published two decades later and retitled *The New Media Monopoly*, Bagdikian noted that the number of corporations that controlled most media outlets had fallen from 50 to five. With the number of newspapers declining around the country due to consolidation and the aforementioned decline in revenue streams, critics bemoan the proliferation of “news deserts”—places that receive no news coverage at all.

News Organizations Are Error-Prone

News is produced under challenging circumstances. Even the most conscientious and honest reporters often must file their stories before all the facts are known, with different sources making contradictory or competing claims, with editors pressuring them to get information that their competitors do not have, and to get the copy in sooner rather than later, and with the desire for raises, promotions, and awards occasionally clouding their judgment. Hunting for journalistic gaffes, large and small, is almost a pastime for some critics, from the self-styled “grammar police” wagging fingers at every misplaced modifier and missing apostrophe, to those who conduct in-depth evaluations of the industry’s collective performance during or after coverage of a major news story.

Such criticism can come from outsiders—people who do not work for a news outlet—and insiders. Insider criticism can take the form of columns with names like “On the Media,” which analyze trends in the industry as a whole, as well as the output of staffers with titles like ombudsman, readers’ representative or public editor, whose job it is to hold their own news organization to account. The hiring of in-house critics took on greater urgency in the early 2000s when editors sought to regain public trust following a series of embarrassing scandals involving

reporters and columnists who were found to have fabricated and/or plagiarized. Some readers are naturally curious about how and why certain editorial decisions are made. The in-house critic is charged with directly answering or anticipating such questions by interviewing the editors and reporters responsible, just as a reporter would interview any outside source. The message to readers is that the news organization is holding itself to the same level of scrutiny and accountability as any of the powerful institutions it covers.

The use of professional in-house critics has waned in the second decade of the 21st century, in part because web-based journalism has given readers a platform to voice their criticisms of news coverage directly and instantaneously, in the form of a comments section appended to many of the stories and opinion pieces. Space limitations in print newspapers meant that only a very small and strictly curated selection of letters to the editor could be printed on any given day; now, it is not uncommon for a controversial topic to generate more than a thousand responses, some portion of which address the quality or tone of the journalism rather than the topic itself.

News Organizations Have Political Agendas

Depending on the political orientation of the critic, the same news organization can be vulnerable to charges that its status as a big corporation inclines it to defend the political status quo, or that the (presumed) liberal orientation of its staff biases it in favor of progressive causes and candidates. Far from being the impartial transmitters of fact that they claim to be, news organizations, according to this view, are ideologically driven, and what’s worse, the myth of objectivity at the center of journalistic culture blinds them to their own biases.

Here, it must be acknowledged that the criticism itself may be ideologically driven. Just as one sports fan will be convinced that an umpire or referee made a blatantly wrong call if that call goes against the team they’re rooting for, a fan of the opposing team will be equally convinced that the official’s call was exactly the right one. Bias, the saying goes, is in the eye of the beholder.

Coverage of elections is a case in point. Among the roles the news media assigns itself during a political campaign is the vetting of the candidates. Such work typically includes probing the politician's past pronouncements and behavior for inconsistencies. To opponents of that politician, such shifts smack of opportunism or pandering. But to the politician's supporters, the same shifts come across as a welcome sign of a willingness to evolve in the light of new information or experience, while the news organization's dissection of those shifts comes across as an unfair "hit piece"—and a sign, possibly, that the news organization has taken sides.

The word "objectivity" has fallen out of favor, in part because it suggested a kind of journalistic arrogance—a belief that those who report the news somehow stand above the fray and are therefore uniquely qualified to offer an accurate, undistorted view of what is going on in the world. Instead, mainstream journalists say they strive to be fair, neutral, impartial, or unbiased. They concede to having opinions about or reactions to news and newsmakers, but insist that it is possible to be aware of those opinions and reactions and to set them aside when crafting their reports—especially since they know that their critics keep a sharp eye out for any sign that they are not being neutral or fair.

While debates about the fairness, neutrality, and impartiality of the press rage on, journalists have also had to contend with critics who say that robotic adherence to principles of fairness or neutrality leads them to uncritically solicit and present the views of those who are clearly lying or lack the expertise to speak authoritatively on the subject in question. An example from the early 2000s was reporting on climate change. In stories in which they quoted climate scientists' dire predictions about the dangers of rising temperatures, many reporters felt obliged to find climate scientists—or critics of climate scientists—who dismissed the predictions and challenged the expertise or integrity of those making them. The upshot of such stories was that the science was far from settled, and that perhaps the problem was not so urgent after all. Because of such criticism, news organizations have since tried to do a better job of flagging false statements and, in the case of climate

science, indicating that climate change is a matter of fact, not opinion.

News Organizations Are Bastions of Naïve Empiricism

A series of sociological studies of the news that were published in the 1970s challenged what might be thought of as an agricultural or archaeological view of how news is produced: the notion that reporters harvest or collect the news as if it were a crop or a collection of relics to be brought back to the newsroom and then arranged for presentation to audiences. News, these researchers found, isn't so much gathered as constructed.

Regarded as an occupational culture, the newsroom is bound by a set of traditions that dictate what kinds of occurrences are considered newsworthy, the sets of practices deployed to yield information about a given newsworthy occurrence, the selection and organization of the information thus gathered, and the selection of words used to present that information to the public. Critical attempts to identify the underlying criteria by which journalists gauge the newsworthiness of an occurrence raise questions about the degree to which every stage of news production is predetermined by an inchoate news template. A sense of what the story is and how it should be told will influence where reporters go for information, who they talk to, what questions they ask, what they notice, which observations and answers they deem relevant when they sit down to write, and the order in which they assemble that raw material. The result, according to some critics, is a partial account of reality that obscures as much as it illuminates, oversimplifies complex realities and, often reinforces the ideological status quo.

An example would be the story of Kitty Genovese, a young murder victim whose cries for help, according to news coverage at the time, were ignored by her New York neighbors. The 1964 incident gave rise to what became known as *bystander theory*, the idea that in a situation where multiple people are available to help, each person will assume that someone else will act, and therefore, no one does. Years later, researchers reinvestigated the story, found that the story that Genovese's cries for help were ignored was

essentially false, and suggested that the story confirmed prevailing myths about urban life: that city folk were so busy, self-absorbed, self-protective, and numb to the sufferings of others that they had lost the fundamental human impulse to help their fellows.

A related criticism of journalism's occupational culture is that it breeds conformity, yielding television newscasts that all look and sound very much alike, and a selection of stories that varies little from one news outlet to another. Some critics attribute the lack of diversity in thought at least in part to the lack of demographic diversity: A mostly middle-class, mostly male, mostly white staff, which was the norm until late in the 20th century, will tend to focus on news that is of interest to white, middle-class men and ignore news that is of interest to women and people of color. News organizations have become sensitive to the problem, but their critics see lack of diversity as an ongoing problem.

Concluding Thoughts

The last of the four sections of the Code of Ethics of the Society of Professional Journalists calls on journalists to "be accountable and transparent." Implicit is a recognition that it would be hypocritical for journalists to serve as a watchdog protecting the public interest from abuse of power by powerful people and institutions, while failing to hold themselves to the same high standard. The code of ethics focuses on self-policing, but there are also press critics, both in-house and out, professional and amateur, academic and journalistic, who essentially serve as watchdogs of the watchdog.

Some press criticism amounts to what is known in the sports world as *working the refs*: Knowing how sensitive journalists are to charges of bias, newsmakers complaining about being treated unfairly as a way of pressuring journalists to treat them better. So effective have these campaigns against the press been that it has almost become the conventional wisdom that most reporting is slanted, sensationalistic, and sloppy. The result may be a society in which no sources of information are trusted, there are no mutually agreed-upon sets of facts, and everyone believes whatever they are predisposed to believe. In such a society,

paralysis can set in, with the most aggressive liars and power seekers winning the war of words and seizing the levers of power.

Some press criticism is constructive: Some journalism is slanted, sensationalistic, and sloppy. If it is agreed that good journalism is indispensable to a free and just society, then press criticism is equally indispensable in keeping pressure on journalists to do their indispensable work as well as it can be done.

MEDIA LITERACY

Media literacy, as a space of practice and field of research, is concerned with how people critically consume and produce media in all forms. General definitions incorporate the abilities to access, evaluate, analyze, reflect, and create media across platforms, modalities, and content areas. Media literacy interventions range from formal learning environments to communities and organizations.

As an umbrella concept, media literacy incorporates subliteracies that focus the core

competencies of media literacy onto specific media practices. Common subliteracies include digital literacy, data literacy, health literacy, information literacy, civic literacy, and news literacy. Media literacy research and practice has long been concerned with journalism and news. These specific information environments are tied directly to democracy, and as such media literacy concerns itself with nurturing more civic-oriented participants in democracy.

Journalistic practices are increasingly situated in online spaces, and influenced by social networks, algorithms, and other digital technologies. As a result, how people engage with news and understand journalism practices are more central to the practices of media literacy. This entry introduces the main definitions and approaches to media literacy practice. It follows by exploring major debates in media literacy, followed by constraints and new directions for media literacy practice and research.

Media Literacy Definitions and Practices

Media literacy, a broad space for research and practice, often finds common ground in its aim to prepare people to critically understand media texts, reflect on their meanings and intentions, and meaningfully participate in media environments when possible. Definitions are often contested and applications vary, but major trends in media literacy practice and research involve developing competencies in people to critique and create media. Common media literacy approaches teach people to analyze advertisements, evaluate the sources of a news story, detect bias in political speeches, assess websites for credibility and verification of information, and create media in all formats. Typically, these approaches have found homes in formal spaces for learning, but have moved beyond classrooms into after-school programs, community organizations, and public institutions.

Formal Spaces of Learning

From primary school to higher education, media literacy's most common point of engagement is the formal classroom. Media literacy in

this context is devoted to developing learning interventions that help people become more savvy consumers and producers of media. Most media literacy research and practice, as a result, is designed for young people. Schools provide structured settings to work with students, experimenting with creative approaches to engaging with media, focusing on deconstructing media messages, remixing media narratives, and creating content.

Interventions at younger ages focus on more basic competencies on spotting and differentiating content types and message intention. At secondary levels of education, media literacy focuses more on Internet safety, online bullying, social networks, and on credibility of news and information. Media production practices are also increasingly common in secondary education, where students work on creative expression and positive social messaging through media. Student newsrooms also now incorporate media literacy practices to help young reporters understand and reflect on the impact and scope of their work. Media literacy practices in secondary education also focus on public health, combating beauty industry messaging that sets narrow and unrealistic standards for young girls, and preparing young people to navigate online information spaces, such as YouTube, Facebook, and TikTok.

In higher education, formal media literacy practices engage the media's role in democracy from a critical lens, focusing on manipulation, propaganda, inequality, and theories of control and oppression with and through media. These theoretical topics are complemented with practices around critical media making. Whether in film, journalism, public relations, advertising, or other communication/media related disciplines, as students learn the skills of media production and dissemination, they are asked to consider point of view, bias, framing, and audience.

Connections to Democracy, News, and Citizenship

As media have become more central to daily life, media literacy has become more concerned with democratic processes, news ecosystems, and civic participation. Media literacy practices focused on democracy find relevance in teaching

about civic systems and civic participation. Media literacy practices here are concerned with deconstructing the intent of political speeches, providing knowledge of how persuasive political information practices can impact public deliberation, and understanding how new technologies are impacting public dialog and credible information.

Alongside connecting media explicitly to democratic processes, media literacies have recently devoted significant attention to exploring journalism and news ecosystems, as they have been dramatically impacted by disruptive technological growth. Journalism industries are struggling to adapt to new business and information realities, while newsgathering and reporting now regularly competes with online spaces that are subsumed by personal expression, sensational content, and misinformation. News media literacy practices prepare citizens to better understand the changing landscape for journalism, while at the same time developing savvy news consumption skills. Many news media literacy initiatives struggle to keep pace with the changing norms for news delivery systems and platforms, and ever-changing journalistic norms.

In digital culture, media literacy research and practice has focused extensively on how people use media to meaningfully participate in daily civic life. Participatory culture explores the ways that people navigate the mediated spaces that allow for expression, dialog, interaction, and advocacy. Media literacies often focus on the benefits and harms of these online spaces, and use such dialogs to ask how people can meaningfully use online spaces to participate in civic life.

Ubiquitous Digital Technologies

The emergence of social networks and large media platforms in daily information and communication has propelled media literacy to focus on how large scale platforms, connective networks, and algorithms are impacting the information ecosystem. Media literacy practices center on critical inquiry about the role of algorithms in information dissemination, about privacy breaches by platforms that collect user data and repurpose it without consent, and how social networks prioritize information that is sensational, polarizing,

and that attracts like-minded groups into shared spaces for communication.

Media literacy has also worked to embrace the potential of technologies and platforms to bring communities together to advocate for causes, support peers, and to offer spaces for more diverse information gathering. Here media literacies concern themselves largely with how to navigate online spaces safely and securely, to distinguish misinformation from credible information, and to participate in spaces that are generative and beneficial. Terms like algorithmic literacy and data literacy have emerged recently to focus more on how data and algorithms impact media and information, and how people can use data in creative ways to help shape algorithms and connect data to human stories.

Major Debates

While general consensus exists about what media literacy hopes to achieve through implementation and practice, there exist several major debates that continue to frame research inquiry and dictate support from foundations and public institutions.

Empowerment Versus Protectionism

Perhaps the longest running debate in the media literacy field has been whether the goal of media literacy pedagogy is to protect people from media manipulation, bias, and harm, or to empower people to have voice, agency, and the ability to participate in society. While the debate has no clear defining characteristics, the protectionist approach normally responds to what is seen as a harmful media ecosystem, where: advertisers prey on young people from just after birth; companies use media tools and technologies to invade personal space and encroach upon privacy rights; bullying and other more harmful practices are abundant in online spaces; mass media and politicians use manipulative information techniques to distort truths; news organizations, which require profit over public benefit, select content that is more spectacular and sensationalized over that which is necessary for democracy to flourish; marketers use invasive media practices to gain eyeballs and offer ever sensationalized content; and large media corporations dictate

how information is produced and disseminated. This landscape necessitates teaching people how to protect themselves from media manipulation, and to do so they must learn how to critically consume media, to avoid harmful media practices and unsafe mediated spaces, and to take action when possible to combat such harmful practices.

The empowerment approach to media literacy focuses on providing the competencies to empower people's consumption and use of media for personal and public benefit. This approach believes that media systems are complex, and present multiple benefits and risks. Empowering people to use media in savvy ways avoids cynicism, negativity, and mean world effects. It acknowledges risks inherent in all media use, but prioritizes creating media habits and messaging that positively contributes to society. Empowerment approaches often focus on voice, agency, and participation. They use the personal interests of people (e.g., pop culture, sports, arts) to develop interest and promote meaningful engagement and participation with and through media.

Media Literacy Versus [Sub] Literacies

There has been a longstanding debate in media literacy on whether subliteracies benefit the space of research and practice, or if they create unnecessary redundancies, and negatively impact cohesion among scholars and practitioners. Media literacy is often understood as an umbrella concept, with core values and approaches to research and practice that span across the media ecosystem.

Despite media literacy's wide application, subliteracies have proliferated. Areas such as news literacy, data literacy, information literacy, and health literacy develop specific content area focus, but that often recreate core media literacy approaches. Debates exist about whether these groups should be aligned in how they share and collaborate versus working in silos that offer strong focus but lack scholarly and pedagogical collaboration.

Political Versus Apolitical

Media literacy has been consumed by political orientation. These debates have questioned whether media literacy pursuits should be funded by large media corporations, and whether media

literacy practices should take positions on issues such as climate change, gun rights, and immigration. Media literacy often aspires to promote critical understanding and civic applications, which reflect ideologies and viewpoints of the practitioners, researchers, and educators who design and implement media literacy experiences.

Public schools maintain a nonpartisan approach to curriculum. As such media literacy skills can be taught, but debates persist as to whether media literacy can be taught in public schools using a critical approach. Media literacy practices that involve climate change messages, gun ownership debates, immigration discussions, or LGBTQ rights often become spaces of contested terrain, where educators must navigate school policy, knowledge of issues, and student ideologies. When deconstructing news messaging, mainstream media outlets are often cases for media literacy inquiries, however there is little consensus on whether such inquiry can or should be apolitical.

Constraints

Alongside major debates in media literacy practice, certain constraints have hindered the advancement of media literacy as a field of inquiry and as a space for pedagogy and practice.

Solutionism

Media literacy has often been described as a panacea for the ills of media and society. With a proliferation of misinformation and fake news, many advocate for media literacy as the response. Seeing media literacy as a solution to a problem forces practitioners to define a problem that is often complex and nebulous. As a result, media literacy is reduced to a set of practices that often fails to keep pace with technological and media systems advancements and avoids rigorous and complex discussions.

Skills Without Application

Media literacy is often articulated as a set of skills that people can learn to better consume and use media. There is often an assumption that media literacy skill attainment leads to beneficial social outcomes. There is little evidence that

teaching people to analyze media content and identify credible versus false information leads to improved civic or social outcomes. There is evidence that people do become more critical readers of media, and this is a notable achievement. However, a focus on skill attainment often promotes transactional approaches to media literacy, where people are asked to master a competency but not connect it to large democratic ideas.

Unintentional Cynicism

Media literacy skill attainment can lead to increased cynicism about media messages and systems. This is apparent when media literacy interventions focus primarily on how media manipulates, when media are wrong, and how bias works in media messages. In such cases, research has shown that people learn to spot manipulative media techniques but are less trustful of media in general and less willing to engage with media.

New Directions

In recent years, media literacy has taken on new priorities as media continue to evolve technologically and economically. With each new platform, and ever increasing disruptions to media systems, media literacy practices reinvent themselves to attend to the social, political, and economic realities of daily life.

Civic Media

Media literacy has recently been concerned with the civic capacities of media. As traditional types of civic participation have moved largely into mediated spaces, new research in media literacy focuses on the technologies, designs, and practices that help people use media for civic betterment. This includes specific attention paid to local advocacy, and efforts to use media to promote inclusion and equity, advance environmental concerns, and support social justice movements.

Misinformation

The proliferation of so-called fake news in online environments has led to a focus on how

media literacy can be used to combat this phenomenon. Media literacy practices prioritize fact checking, source identification, and assessing the credibility of online profiles and platforms. This approach has been challenged by the invasive and often complex ways in which algorithms and bots work to spread information.

Platforms

Media literacy practices are shifting from a focus on content to a focus on platforms. As large scale social networking platforms such as Instagram, YouTube, Twitter, and Facebook continue to grow, alongside search engines such as Google and emerging expressive spaces such as TikTok, WhatsApp, and Snapchat, media literacy research explores how people use these platforms, how the platforms use users, and how information and communication flow in these spaces.

Data and Algorithms

Data and algorithmic literacies have emerged in response to the proliferation of big data in daily information and communication flow. Data literacies are particularly interested in teaching people how data are secured, how they are used to identify and target audiences, and how people can secure their data rights, understand privacy and data, and use data to tell their own stories. Algorithmic literacies focus predominantly on the ways in which algorithms are used to personalize information. Algorithms are generally seen in a critical light for media literacy, where they expose inequities, injustice, and often exclude marginalized communities.

News Ecosystems

As news systems continue to be dismantled and journalistic practices are disrupted, media literacy devotes considerable attention to the new ways in which people will find, consume, and engage with news. Local news efforts are hardest hit by current economic and technological shifts, and media literacy efforts are focusing on how local communities can learn to be more involved in news ecosystems, and support new models for journalism practice in digital culture.

MEDIA MARKETS

Media markets are of relevance to journalism as they determine the structure of the news media ecosystem, and thus impact the public sphere’s

access to information and content. The structure of the media market, for example, could cause an imbalance of power in news producers or diversity in journalism content, which could influence public policy or societal culture.

The economic definition of market refers to the context in which suppliers and consumers interact to determine the price of goods or services. In an effort to define a market, one must be able to identify three factors: the good or service, those providing it, and those who can buy it. The identification of these three factors helps further understanding of market behaviors, which then allows for the prediction of market outcomes.

When a good (i.e., product or service) is specific and thus easier to identify, market structure and market behaviors are also typically easier to identify. Several characteristics of market structure, including the degree of market power, barriers to market entry, and market externalities, can impact market behavior. First, dominance of supply or demand by one or few makes for a high degree of market power such as in the case of a monopoly or oligopoly. The existence of such an imbalance in market power can, of course, impact the price of goods. Second, imbalances in market power are often exaggerated by barriers to entry such as technical, economic, or regulatory hurdles that limit new participants into the market to produce products with enough differentiation to increase market competition. Third, any external influences such as political, economic, social, or technological factors may impact behaviors within the market.

News as a good or service is unlike any other product and has several distinctive features. First, it is a public good—it is both nonexcludable and nonrivalrous. In other words, it is difficult to prevent access to news. Consumption of news by some doesn’t materially impact consumption of news by others. Furthermore, purchase of the good is based on imperfect information. News has a high degree of originality so potential consumers make purchasing decisions without having full knowledge of the product.

This entry discusses the evolution of media market definitions and the principles upon which these definitions rest within the context of journalism and the news media ecosystem at

large. The definition of media markets has evolved through a number of iterations—some based on product determinations and others based on geographical considerations. The way in which a media market is defined or delineated is important as it relates to the promotion of competition (and the limiting of anticompetitive behaviors), which has an impact on consumer activities within the market. Understanding is thus of relevance to economists, policymakers, media managers and investors, scholars, and students alike.

In discussing the variety of media market definitions and associated concepts, this entry also highlights the potential challenges of applying these definitions to media markets in today's digital networked economy. The entry concludes with an explication of external factors that influence media markets.

Product-Based Media Markets

Historically, media markets are defined by looking at the specific product, content form, or medium. Newspapers, books, movies, radio, and television each capitalized on specific attributes of a distribution medium or network to provide content to the audience. Thus, each was its own media market. Producers would supply content and consumers would demand content, which was always coupled with a medium to define the market. Each media market was clearly defined and recognized.

Generally, as applied to the context of media, markets are uniquely defined. The media economy is an amalgamation of a variety of supply and demand contexts ranging from news to advertising to entertainment content to tech. Of course, media markets today can be both physical and digital. The supplier–consumer relationship in a media market is reflective of business to business, business to consumer, and even consumer to consumer relationships.

Dual Product Media Markets

Many media companies today in fact function in a dual product market in which one product (e.g., news or entertainment content) is targeted to consumers and the other product is the

consumers themselves, which is in effect purchased by advertisers. In other words, media companies can offer products in two distinct, but connected markets: the market for audiences and the market for advertisers. In the first, audiences provide time and attention in exchange for consuming content. In the second, advertisers purchase audience attention.

It is important to note that not every media firm operates in advertising sales. Many, however, are supported—at least, in part—by them. Examples of ad supported media products include many print newspapers and magazines (as well as their digital counterparts), podcasts, broadcast radio, TV networks, and cable television.

In defining media markets based on product, content, and medium, one could also analyze market behavior via patterns of market competition and concentration. For example, is the media market a monopoly, a duopoly, an oligopoly? Is there monopolistic competition or perfect competition or somewhere in between?

With regard to journalism, a media market refers to the context where producers supply, and audiences consume the news. It also, however, refers to the economic, social, and political consequences of those market behaviors. The product dimension of a media market has long been used by policymakers and scholars to understand market structure and market behavior. The dual product nature of media markets makes for a situation in which market structure and market power can uniquely impact economic, social, and political aspects of the public sphere. In the context of local journalism, for example, the structure of media markets can impact diversity of and access to content, as well as the overall robustness of a local news media ecosystem.

Today, however, defining media markets based on product determinations is a challenge as companies constantly redefine themselves and adjust their business models. For one, many firms produce and sell content distributed across a variety of platforms and mediums. In fact, most media companies strive to compete in several markets at once, diversifying their revenue streams across sectors. The product- and medium-based approach to defining media markets worked well historically; however, it serves little use in today's digital networked economy.

Geographically Based Media Markets

In addition to the product or medium dimension, traditional media companies also function in media markets defined by geographic dimensions. Newspapers or radio broadcasts, for example, historically operated in media markets determined by the location in which their products were offered. Media markets can be global, national, regional, or local.

Designated Market Areas

In the United States, for example, one way in which media markets are geographically defined is through an instrument known as the Designated Market Area (DMA). DMA regions are the mutually exclusive, geographically bounded areas in which people receive the same broadcast television options. There are 210 DMAs (geographic media markets) in the United States. DMA boundaries and DMA data generated from measurement of media consumed in each media market are owned by Nielsen. These data have long been essential for marketers, researchers, and media managers.

Every U.S. county is in a DMA, which are generally linked to major metropolitan areas, but can overlap in more rural areas. In other words, DMAs do not always fit neatly within state boundaries. Consider, for instance, media markets such as New York, Philadelphia, Boston, Kansas City, Chicago, or St. Louis, which extend beyond their home state into neighboring states. The Chicago DMA encompasses the city and surrounding areas in Illinois, but also portions of Indiana.

In the context of journalism, this means that a TV news station in the Chicago DMA should cover news across the DMA in an effort to meet local information needs of its community. However, TV viewers in similar geographical situations have long argued for a solution to the lack of local TV news. DMAs as an example of geographically based media markets are just another instance in a long line of raised concerns regarding journalism divides. These divides refer to the differences in the availability or robustness of journalistic resources across communities. Journalism divides have been found to follow patterns similar to

those depicted in the extensive literature on digital divides and show that lower income and more ethnically diverse communities generally have access to less robust local news media.

Further compounding the problematic nature of geographically based media markets is the popularity of the Internet and alternatives to traditional television. The number of U.S. households subscribed to pay TV (i.e., cable/satellite) continues to decrease each year as the number of households without pay TV continues to increase. Many people use digital streaming services to watch television content. Indeed, with a growing number of consumers moving away from traditional television services, DMAs and geographically bound media markets in general face a multitude of challenges with regard to their utility.

Core Function Media Market

One final approach worth discussing in a sense combines both the product and geographic dimensions of the media market. Alan B. Albarran proposed the core function media market, which is defined by identifying both the media content and the media distribution. The content of the media market—as opposed to the medium—might be news, music, film, or even user-generated. The distribution of the media market refers to whether it is broadcast, print, pay TV, or even streaming.

The core function media market certainly offers a bit more flexibility and utility for the identification of media markets than those defined along product or geographic lines; however, it does not come without its own challenges. In today's digital network economy, there are an increasing number of markets that overlap and intersect with media. Take online search, for example, in which content creation and content distribution might not be the core function of the market, but they're still critical to its functioning.

Market Factors

Indeed, there is no one size fits all method for delineating or defining a media market. Media markets must be analyzed and understood within the overall political, economic, social, and technological environments in which they function. In other words, the evolution of media markets is not

strictly a consequence of change from within the media ecosystem itself, but rather highly connected to changes in the external environment as well.

In the United States, political conditions such as the regulatory bodies of Congress and the FCC continue to impact the structure and activities of media markets. Historically, government regulation continues to trend toward less stringent policies of media ownership. Globally, trade agreements such as the North American Free Trade Agreement (NAFTA) have opened media markets and corresponding activities up to a global playing field.

A number of economic indicators impact media markets as well. In general, economic factors such as employment trends, the rate of inflation, consumer access to capital and willingness to spend all affect the general business climate, including media markets. If the economy begins to decline, consumers spend more conservatively. If retail sales decrease, companies may decide to spend less on advertising. In the news business, for example, this would lead to a decrease in potential revenue.

As society continues to evolve, so too does the makeup of media audiences and their corresponding consumption habits and behaviors. Audience fragmentation, for example, continues to increase across a growing range of news delivery platforms and an expanding array of news content options. Such proliferation impacts the structure of media markets.

Last, but certainly not least, are the technological forces that are highly consequential for media markets. Technology is interconnected with almost all aspects of the media value chain from production to distribution to exhibition. Indeed, technological disruptions resulting in transitions to digital, mobile, and social media have completely transformed journalism and media markets.

In sum, the digital network economy has had a tremendous impact on media markets. Digital technology lowered production costs for many forms of news and enabled the distribution of news content across a variety of formats and platforms. A general detachment of content from its geography, medium, platform, or means of distribution enabled consumption that is increasingly driven by interest and engagement in the content itself. Such a shift in audience consumption impacts market demand behaviors and furthers

general market transformation leaving the old guard of media market definitions less applicable. Thus, media companies, media regulators, and media policymakers currently face challenges in delineating how to define a market or where to hinge a business model.

MEDIA MONOPOLY

Journalism professor Ben Bagdikian coined the term *media monopoly* to describe the concentration of ownership of the dominant media entities in ever-fewer hands. Although monopolies can be said to exist in many local media markets, he used the term metaphorically. No single firm owned all the mass media in the United States, and the prospects of that coming to pass were remote. Nonetheless, media were increasingly controlled by huge multinational corporations, Bagdikian argued, with serious implications for our information infrastructure and the quality of our news and our democracy.

Before joining the faculty at the University of California, Berkeley Graduate School of Journalism, Bagdikian spent three decades as a journalist, sharing a Pulitzer Prize for his work at *The Providence Journal* and later playing a key role in *The Washington Post's* publication of the Pentagon Papers. Much of his journalism focused on social issues, including racial discrimination, poverty, housing, prison conditions, and migration. In 1970 Bagdikian's prescient *The Information Machines: Their Impact on Men and the Media* explored the implications of the then-emerging electronic media and the growing institutionalization of the media.

Bagdikian returned to this question over seven editions of his book, *The Media Monopoly*, published between 1983 and 2004, the final edition of which was titled *The New Media Monopoly*. Fifty companies owned most major U.S. media outlets, he argued in the first edition. By 2004, five conglomerates owned most of the major newspapers, magazines, book publishers, motion picture studios, and radio and television stations in the United States. Not only was ownership more concentrated, the surviving firms were conglomerates operating on a global scale and enmeshed in dense networks of joint ventures. This entry discusses the increase in economic concentration in the media industry since the first edition of Bagdikian's book, concerns about how that concentration affects news coverage and U.S. democracy, and difficulties in measuring monopolization in the industry.

Economic Concentration in the 21st Century

The landscape has changed in many ways since then. With the explosion of the Internet and cable television networks, it has become more difficult to define the relevant media markets or how they are served. Not all of the big five Bagdikian identified have fared well since 2004. Time Warner, now WarnerMedia, shed its magazines and AOL before its cable systems were purchased by Charter Communications and its film and television properties by AT&T; Disney has acquired 21st Century Fox, the film business that was once part of News Corporation; News Corp. remains a global player but on a reduced scale; Viacom has once again absorbed

CBS; and Bertelsmann remains a dominant European media conglomerate but in the United States is now a major player only in book publishing (owning Penguin Random House). While Bagdikian stressed the diversification of these global players, and also the web of cooperative ventures in which they were enmeshed, many have retrenched since the Great Recession and the Internet transformed the economic structure of legacy media, in particular by decimating advertising revenue.

Today film and music are often distributed internationally, but most media operate at a local, national, or regional level. Bertelsmann's RTL Group operates radio and television stations and networks across Europe, while Comcast-owned Sky Television distributes television programming by satellite to European countries and through subsidiaries in Brazil, Indonesia, Japan, Mexico, New Zealand, Philippines, and Turkey. Global conglomerates such as Bertelsmann, Informa, and RELX publish thousands of magazines and other specialized media, but most serve particular countries or industries. In Canada, Postmedia—controlled by Chatham Asset Management, which also owns McClatchy newspapers in the United States—dominates the English-language newspaper market. News Corp., which owns the *Wall Street Journal*, *New York Post*, and the HarperCollins publishing house, is also a dominant force in Australian and British newspaper markets. Rupert Murdoch also controls Fox Corporation, with its broadcast network, local television stations, and news and sports cable channels.

Around the world, many countries have highly concentrated television and newspaper markets, and the major players often cooperate in joint ventures and regional alliances. However, these sectors are also quite volatile as advertising-dependent media have been battered by global recession, and many have been acquired by investment firms specializing in distressed assets which they hope to make more profitable through consolidation and retrenchment.

Media Monopoly and Democracy

The seven editions of *Media Monopoly* addressed issues beyond the enormous size of these companies, including what Bagdikian saw as the intrinsic

contradictions between advertising sponsorship and meeting societal information needs, the preference of the corporate titans who ran these firms for economic and political policies that would serve their business interests, and the antidemocratic implications of, as one chapter title in the sixth edition put it, “public information as industrial by-product.”

Bagdikian believed that the consolidation of media in fewer and fewer hands had major consequences for the quality of the information ecosystem, the diversity of perspectives heard in public debate, and the robustness of U.S. democracy. He was especially concerned with the enormous power these media conglomerates held, and with the natural tendency of media controlled by the rich and powerful to give disproportionate emphasis to their concerns—to see enormous concentration of wealth as normal, perhaps even desirable. The private equity firms and other investors who increasingly control media firms are driven almost exclusively by profits, always seeking a higher rate of return. One can see the consequences of this particularly in the newspaper industry, where hedge fund owners have followed the purchase of dozens of newspapers with massive layoffs and used newspapers’ revenues for speculative ventures, and in the waves of acquisitions and bankruptcies that have swept through many communications sectors.

Bagdikian was equally concerned by the U.S. media’s reliance on advertising for so much of its revenue. This reliance has consequences for the audiences served (the affluent are more desirable to advertisers), for content (advertisers prefer congenial surroundings for their messages), and for local news and investigative journalism (which is more expensive to produce than features and punditry, both of which are also easily syndicated, further reducing costs). Advertising permeates the entire media sphere, even intruding into film and television scripts and news websites (as “sponsored content”). It encourages a fundamental alienation between the media’s revenue stream and their ostensible purposes (whether to inform or to entertain).

In recent years, the takeover of the largest newspaper chains by hedge funds has contributed to the growing phenomenon of so-called

new deserts, places in the United States without local newspapers or any reliable source of news, even as the media barons expand their domains and their wealth. By 2004, when *The New Media Monopoly* was published, many looked to the Internet for news and for information on art and culture. Bagdikian warned that the Internet too was under the control of the monopolists, but insisted that this was not inevitable. “It is not too late to mandate use of the enormous capacities of the country’s communications technology and the powers of antitrust actions to diminish the domination of the media by a few powerful conglomerates” (p. 265). (Moreover, recent research has established that nearly all original reporting online and in broadcast media originates from newspaper firms.) Bagdikian looked to a revitalized media reform movement seeking stronger antitrust and public interest broadcast regulation and an expanded public media sector as a beacon of hope; the task of reconceptualizing media as a public good, and to devoting the necessary social resources to its sustenance, is today more pressing than ever.

Measuring Monopolization

It can be difficult to test the proposition that a particular number of firms control the “lion’s share” of the mass media. In part, this is because of the distinctive nature of the regional and specialized markets most media serve; the *Reading* (Pennsylvania) *Eagle* did not compete with the *Denver Post* even before Media News Group added it to its portfolio, nor are the listeners to Saga’s conservative Christian radio stations choosing between them and their local Radio One (an ownership group targeting African American listeners) station. Speaking of a unitary media has always been a fraught enterprise, but particularly so with the fragmentation seen today in television and online media.

There are also empirical challenges. Most major magazines in the United States, and a significant number of other media firms, are privately held, and so need not publicly report financial results. Whether to avoid embarrassing their members or because of insufficient resources, trade groups such as the News Media Alliance have ceased publishing industry-level data. The scope and detail of

economic information made available to the general public through the U.S. Census Bureau has been dramatically scaled back as data were instead contracted to information brokers. Published census categories do not necessarily meet the needs of the researcher; for example, broadband and video services are subsumed within a broader telecommunications sector that also includes telephone service. Comcast, AT&T, and Charter Communications dominate broadband and cable television in the United States, operate as monopolies (or, at best, as part of duopolies) in nearly every market they serve, and have enormous market power. But to state with precision their market share on a national level is a difficult proposition.

The census similarly reports book industry figures that conflate textbooks, trade books, and books aimed at the professional market. Here, we can turn to *Publishers Weekly* and its annual reports on trade book sales to state that in 2019 five out of the 2,086 book publishing firms the census records accounted for 77% of all revenue for new trade book sales. Newspaper publishing is less concentrated (on a national scale; there are very few cities where there are even two daily newspapers carrying local news), with 35.4% of revenue going to the five largest firms in 2019. (However, the newspaper industry is rapidly consolidating.)

In film, the five largest firms account for nearly two-thirds of domestic box office receipts. (Not all of that revenue goes to the studios, and there are other important sources of revenue including international box office receipts, broadcast and DVD rights, and merchandizing. If anything, the major studios are better positioned to exploit these revenue streams.) The top five radio station groups account for nearly half of radio station revenue; the five major television networks and the local stations they own for 70% of broadcast television revenue. Cable networks rely on a combination of advertising and subscriber fees; the five leading programming firms accounted for 62% of industry revenue in 2019.

Bagdikian was, broadly speaking, correct, and remains so if one excludes certain media types from his analysis. There are no reliable revenue figures for consumer magazines, but while culturally significant they are not economic powerhouses. Music is dominated by global

conglomerates for which it is difficult to break out U.S. revenue. For online media, most legacy firms incorporate revenue from their online products under other headings, while Facebook and Alphabet dominate online advertising revenue, in the United States and globally.

Excluding magazines, music, and online-only media, the five largest U.S. media firms controlled 61.6% of media revenue in 2019; if cable system revenues are included, the six largest firms controlled 51.8%. Comcast (broadcast stations, cable and television networks, cable service, film) was the largest, with \$81.4 billion in media revenues (including cable systems, \$25.3 billion without), followed by AT&T with \$66.2 billion in media revenue (\$19.7 billion from its cable networks and film interests) and Charter Communications (\$45 billion in cable system revenues). Disney had media revenue of \$29.7 billion (broadcast and cable networks, broadcast stations, and film), ViacomCBS \$24.6 billion (book publishing, broadcast and cable networks, broadcast stations, and film), and News Corp./Fox (separate corporate entities, but under common control) with \$23.9 billion in North American revenues from book publishing, broadcast network and stations, news and sports cable networks, and newspapers.

The media monopoly conception, then, addressed not only ownership but also the implications of dramatically concentrating ownership on media performance—and hence on the broader culture and politics. The trends Bagdikian identified in the late 20th century have continued, with, many scholars argue, significant consequences for the quality of democracy in the United States.

MEDIA OWNERSHIP

The significance of media ownership in the United States has been debated since the founding of the country. Media owners oversee the collection, selection, and distribution of information with multiple intentions. The mix of business, politics, and the public trust is integrated into media ownership. The ownership of a news organization involves social responsibility. However, the personal interests of the owner often influences the news and information that is disseminated to the public. The balance between ownership and social responsibility has created extensive debate about the controls and regulations placed on news outlets. As news outlets, platforms and technology change the way the public receives information, the issues surrounding ownership become further complicated. This entry examines the history of media ownership, its influence on news, the regulation of media ownership, and the difference between public and private media ownership.

Background

Early media ownership was limited to authoritarian rule. The ruler of a country would control the information given to the public. Large segments of the globe accepted the basic principles of

authoritarianism as a guide for social actions. The control of information was seen as utility for the common good and the subjectivity of the message was perceived as the surrogate voice for the ruling monarch.

The rise of democracy and the spread of liberalism changed the acceptance of authoritarian media. The populace adopted the liberalism mantra of John Milton, that the market place of ideas will reveal the truth and that there would be a self-righting process. The more information that was available, the more likely the truth will expose itself. The concept promoted self-expression. Media ownership was seen as an extension of the individual and the media was free to express themselves because the false and unsound messages will vanish, under the weight of truth. The 18th century completed the transfer of the press from the authoritarian to libertarian principles.

In the early to mid-1800s, mass media in the United States began with heavily partisan newspapers. Political parties financed the papers to publish their political perspectives. The newspapers, controlled by these parties, were an important means to influence the political process. Multiple political parties would create different news media of the time to sell their political agenda. The papers did not attempt to seek objectivity but instead sold their partisan views to the public. Newspapers were created explicitly to advance the political interests of the parties controlling them.

In the mid-1800s, business interests influenced the changes in the newspaper industry. Political party papers became less profitable than bipartisan, less politically driven newspapers. The rise of the economic status of the reader coincided with the rise of the libertarian press, whereas the functions of the mass media, under the libertarian concept, are to inform and entertain. This concept would result in a more commercialized industry but one that would also maintain substantial political influence. The congealing of capitalism and politics would change the nature of media ownership. Media owners were primarily concerned with making profits but also, in some cases, interested in asserting a political agenda.

Media ownership became a competitive endeavor. The costs of publishing required a cache of wealth. Families with large amounts of capital for investment and growth became leaders of the

industry. News organizations became part of family dynasties, passed down from generation to generation. Families own the most influential and well-known news groups. For more than a century, the Ochs-Sulzbergers owned *The New York Times*, the Chandler family controlled the *Los Angeles Times*, and the Bancroft family managed *The Wall Street Journal*. Many newspapers were founded by individual families, managed for generations, and were central figures in their community politics.

In 1919, the advancement of technology and the creation of radio programming forced the United States government to create regulations, mostly for rules of operation and ownership. Business leaders and politicians fought to keep radio from being a government monopoly. General Electric (GE) developed a plan to create a private sector monopoly, whereas a private company would have the government's approval to dominate the radio industry. GE created Radio Corporation of America (RCA), pooling all the technology and patents to monopolize the wireless industry. At the time, other countries placed broadcasting in the hands of military or government interests.

The government restricted the ownership of RCA. The 1919 radio laws ruled that foreigners could own no more than 20% of any U.S. broadcasting facility. In 1927, the ownership percentage was raised to 25%. In 1985, Rupert Murdoch, the head of Australia's News Corp became a U.S. citizen so he could buy a number of TV stations and form Fox Television.

Modernity brought new modes of news. Technology enabled electronic distribution via radio or television. Consumer size grew substantially and the commercialization of news intensified. The initiation of radio broadcasting into American homes led to a programming and advertising platform, whereas time was sold to advertisers in small pieces. Advertisers could purchase segments of time within a program. Television would adopt this platform.

The news business expanded with the popularity of radio and television. Audience were attracted to the immediacy that radio broadcasts provided: wide access to the public. Radio became extremely popular. "Breaking News" such as the Hindenburg disaster in 1937 solidified the importance of radio broadcasts. The popularity of electronic

news impacted the lucrative investments for broadcasters and advertisers. Arthur C. Nielsen created an analytical system to rate popularity, for both radio and television. The system allowed media owners to analyze and compare the popularity of their shows.

Since the turn of the 21st century, the Internet has grown and is eagerly accepted by the public. News outlets had to respond to the changes in the audience and readers. Newspapers have shown a sharp drop in circulation. The Great Recession of 2008–2009 resulted in a catastrophic decline in advertising and put many newspapers out of business.

Ownership and News Influence

The significance of ownership structures on news coverage has been debated since the beginnings of mass media in the United States. The libertarian press model was consistent in the United States and the power of reaching a large portion of the country was coveted. The objectivity of the news was often a contentious issue between the public and the news organization. The most prominent issues arise from the "media baron" or the owner of one or more powerful media outlets who uses their media outlets to advance economic or political agendas. There are questions raised about whether ownership has any bearing on influence. It is clear that a diversity of owners reflects more democratic principles.

The concerns of the media baron began in the early 20th-century days of William Randolph Hearst. Hearst constructed a media empire to spread his influence on public opinion. At the peak of his fortune, in 1935, he owned 28 major newspapers and 18 magazines. He used his reach to instigate government policy. Sensationalized news coverage, focused on American interests in Cuba, was heightened by competition between Hearst's *New York Journal* and Joseph Pulitzer's *New York World*. Many believe that the outcome of the rivalry between Hearst and Pulitzer was the Spanish-American war. It was one of the first times in history that the news media was able to directly influence public opinion. The result was a short conflict with a memorable headline, "Remember the Maine." After the war, the two tycoons continued their personal feud with

rousing headlines to increase their audiences. This era of journalism, when stretching truth and printing spectacular news reports was common, was labeled, “yellow journalism.”

Hearst and Pulitzer’s influence on the American public was due to the reach they acquired through their media empire. American media owners like Rupert Murdoch (1931–), Ted Turner (1938–), Canadian Conrad Black (1944–), and Italian Silvio Berlusconi (1936–) have wielded the same political and economic influence.

Berlusconi’s media career began in the 1970s and by 1980 he dominated the Italian airwaves with a variety of television stations. He diversified his holdings, acquired department stores, movie theaters, publishing companies, and the AC Milan football team. He consolidated his empire into Fininvest holding company, a vast conglomerate that grew to control more than 150 businesses.

Berlusconi created a conservative political party, Forza Italia, and was elected prime minister. He was investigated for corruption and left office. He was convicted of tax fraud and corruption, but the verdicts were eventually overturned. Despite these charges and criticism of his media ownership, he remained the leader of Forza Italia. He was reelected in 2001 after promising tax cuts, more jobs, and higher pensions.

Family ownership declined as the expansion of radio and television stations grew. News organizations were bought by large publicly traded companies looking to make a profit. By the early 2000s, family-owned newspapers and broadcast stations began to disappear. Corporations with no previous ties to journalism began purchasing news outlets in hopes of expanding their portfolio to stockholders.

The decline of the legacy newspapers led to the rise of the “new media baron.” Twenty-five of the largest newspapers are owned by investment groups. Instead of local ownership that had a vested interest in the community, the new newspaper owners focus on driving performance of their holdings, whereas newspapers are only a small portion.

From 2004 to 2008, hedge and pension fund investors accumulated a majority share of the publicly traded newspaper companies. When revenues fell, the investors questioned newspaper executives about their digital strategies. The

investors were not satisfied. Many newspapers in small and mid-sized markets were sold.

Sinclair Broadcast Group is an example of one corporation attempting to spread its reach to a significant portion of the country. It is one of the largest owners of local television stations in the United States. Their ownership has a conservative political leaning. Anchors of the Sinclair stations, nearly 200, are required to read identical statements, accusing national news outlets of pushing an agenda that was “extremely dangerous to our democracy.” Sinclair stations produce more stories with dramatic elements, commentary, and partisan sources.

Sinclair emulates the cable news industry. Critics cite that the cable news industry produces infotainment. The information that is delivered to the audience blurs the line between journalistic truth, opinion and “alternative facts,” and leads to incivility that comes from treating politics as entertainment. In some ways, Sinclair is a new media baron, modeled after William Randolph Hearst.

Ownership Regulations

Television news is dependent on federal protections. The federal protections are meant to ensure that a new outlet does not control the disbursement of facts to the community and that there is proper representation from both sides of an issue. There are concerns about the lack of diversity if two or more news sources in a community were owned by the same entity. The Federal Communications Commission (FCC) placed limits on the number of broadcast news outlets that can be owned by a single entity. The FCC prevents duopolies in markets where allowing one owner to own two stations would not leave at least eight independently owned TV channels in the market. Under section 73.3555(b)(2) of the Commission’s rules, two television stations licensed in the same designated market area (DMA) may be commonly owned if one of the stations is not ranked among the top four stations in the DMA. However, the FCC makes exceptions for financial hardship. The FCC also limited broadcast licensees from owning daily newspapers in the same market.

The FCC ownership rules are aimed to limit concentration in mass media. The FCC rules limit

the number of radio or television stations that a single entity can own in a single market. In 2018, the FCC loosened the duopoly laws for Sinclair Broadcast Group. The FCC granted the transfer of seven full-power stations from Bonten Media Group to Sinclair. The FCC's defense of the ruling was based on the inability of another operator to be willing and able to purchase or operate the stations as a stand-alone facility. The "satellite exemption" has provided a means for corporations to buy many local affiliates.

There have been attempts to loosen the restrictions on ownership. The FCC passed the Telecommunications Act of 1996. The Act was considered deregulation as the national limits in radio station ownership was eliminated. Since then, the FCC is directed to reassess its media ownership limits every 4 years with the presumption that the limits may no longer be necessary due to the rise of the Internet.

By 2020, a few corporations controlled a large number of broadcast stations. Sinclair Broadcast Group owns 186 television stations and 620 channels in 87 markets. Sinclair raises concern because of their political bias and editorial messages they require their news divisions to broadcast. Other corporations such as Nexstar, Gray, and Tegna have purchased similar numbers of stations. Nexstar owns 199 stations in 116 markets.

In 2019, a federal court threw out changes to media ownership rules approved by the FCC in 2017. The changes eliminated the longstanding rule that prohibited a single individual or company from possessing a daily newspaper and a radio or TV station in the same market. A second change eliminated the rule regarding cross-ownership of radio and TV stations. A third change eliminated the prohibition on owning two of the top four stations on a case-by-case basis.

The court ruled that the FCC should have looked more closely at potential impacts on minority ownership. In the case, traditional media companies argued that the rules limit their ability to compete with newer Internet-based businesses such as Amazon.com Inc. and Alphabet Inc.'s YouTube Unit.

The FCC responded to the federal court by accusing the judges of obstruction in blocking changes to their rules. The FCC claimed that the evidence of newspapers going out of business,

broadcast radio struggling, and broadcast TV facing the competition from variety of platforms should be cause to change ownership rules.

Public Versus Private Ownership

The shift from private to public ownership has proven to be a seismic change to the newspaper landscape. News organizations have become investment commodities. The news organizations were traded like any other publicly held commodity. In 2005, large public and private companies spent USD 3 billion acquiring newspapers from one another. The Pulitzer group was purchased by Lee Enterprises for USD 1 billion in 2005.

In 2006, a series of sales signaled a bull market on newspapers. More than USD 10 billion changed hands, with McClatchy Company, owner of 27 newspapers in 2004, purchasing all of Knight Ridder's 61 newspapers for 4 billion dollars. McClatchy then turned around and sold four newspapers to MediaNews Group and Hearst for USD 1 billion.

In 2007, the sale of newspapers accumulated to USD 20 billion, led by News Corp.'s acquisition of Dow Jones and Sam Zell's buy of Tribune Company. Sam Zell is a real estate mogul and private equity fund manager.

After the 2008 recession, newspaper stock dropped significantly. The market capitalization of publicly traded news companies such as Gannett, McClatchy, and Lee fell more than 80%. Investors began to "flip" the companies as opposed to "buy and hold." The intention of the investors was to make a quick profit or purchase multiple newspapers at the same price they would have paid for one before the recession.

In the wake of the recession and buying/selling of the newspapers, many longtime successful media groups went into bankruptcy. Lee Enterprises, Tribune Company, and MediaNews Group were forced into bankruptcy proceedings by 2012. More than one third of all newspapers have changed ownership at least once since 2004. Seven of the largest 25 newspaper companies by 2004 were investment firms.

The investment firms are extremely different from the newspaper chains that preceded them. The newspapers are usually part of a portfolio, mixed in with real estate, retail, and financial

services. The main business of the firm is not journalism. The significance in the difference between the traditional ownership and the investment firm is the long-term commitment to local journalism. The new owners are not committed to the community but to shareholders who may not have a reason to be concerned about the news coverage. Financial return on the investment into the newspaper outweighs the public service.

Research supports the idea that public ownership results in better financial performance. However, the short-term investment strategy limits the amount of capital expenditure on infrastructure or other resources necessary for newsgathering. The new media barons eliminated staff positions at various news outlets and “hubbed” a small group in one office to complete the same tasks, streamlining similar job roles.

Television has seen significant changes from the 1980s and 1990s. Television networks became a part of corporate conglomerates. Profitability, in their news departments, became a mandate of the new owners. Staff cuts and budget reductions were widespread, resulting in a significant impact to news coverage. Foreign bureaus were shut down and hard news was devalued.

Many critics believe that the ownership is protected by a less critical news staff. Stories that involve their parent company are avoided. Stories that may help their advertisers rise. The result is a “synergy-bias” that complicates the modern newsroom and makes it difficult for news management to navigate potential internal threats caused by their decision to report certain stories.

MEDIA NEWS

MediaNews Group is one of the corporate names of MNG Enterprises, Inc, a major U.S. newspaper chain. MNG does business under the name Digital First Media. The company, headquartered in Denver, Colorado, is majority owned by Alden Global Capital, a hedge fund based in New York. In essence, MNG Enterprises operates MediaNews Group, which is cobranded with Digital First Media. This entry discusses the history of the company, strategies it has used to cut costs and boost profits, its partnerships with other media organizations, and its place among peer media companies.

William Dean Singleton and Richard Scudder founded MediaNews Group in 1985, with both already owning a handful of newspapers. In 1987, the company acquired its flagship publication, *The Denver Post*, from Times Mirror. Through the years, it acquired more newspapers, largely by purchasing financially struggling newspapers and cutting their staffs and expenses. MediaNews grew in prominence with acquisition of several former Knight Ridder newspapers in the 2000s, but the debt incurred through their purchase and from changes in the newspaper industry overall ultimately led to its takeover by Alden and subsequent merger with Alden’s other newspaper venture, 21st Century Media, in 2013.

At its peak in 2000, the company’s newspapers had a combined circulation of about 2.7 million. At the time, a majority of its newspapers were in California, with other properties in Alaska,

Colorado, Massachusetts, Michigan, Minnesota, New Hampshire, New Jersey, New Mexico, Pennsylvania, Texas, Utah, Vermont, and West Virginia. The company has since exited several of these markets. The company also owned KTVA, a CBS affiliate in Anchorage, Alaska, from 2000–2012 and four Texas radio stations, which it sold in 2016.

Through its history, MediaNews was known as a *cost-cutting owner*. Singleton himself earned a nickname of “Lean Dean” for expecting more productivity from fewer staff members and cutting extensively at the newspapers the chain purchased. Singleton’s cutting strategy would be the foundation that many others would follow through the transition to the digital age.

History

Singleton and Scudder teamed up to purchase several newspapers in the early 1980s. Scudder had previously been publisher of the *Newark Evening News* in New Jersey, which his grandfather founded, and which his family sold to Media General in 1970. Singleton had picked up his own family of small weekly newspapers in Texas, but sought to grow with a purchase of the *Fort Worth Press* from Scripps. At 24, he tried to personally manage the *Press* and brought about its demise just 88 days into his leadership. In 1976, he connected with Joe Allbritton, then owner of the *Washington Star*, and convinced Allbritton to purchase the *Westfield Evening News* in Massachusetts. Allbritton subsequently purchased several more small papers in the northeastern United States for Singleton to run and named him president of Allbritton Communications.

As president of Allbritton Communications, Singleton took charge of the *Patterson News*, which is where he first connected with Scudder. The *Patterson News* owed Scudder’s newspaper recycling company several hundred thousand dollars, and when Scudder called Singleton to settle the debt, the two began a friendship. Their relationship turned into a business partnership when the duo purchased the *Gloucester County Times* in New Jersey in 1983, and Singleton left Allbritton. They bought more newspapers and eventually consolidated them under the MediaNews brand in 1985.

MediaNews built its portfolio from suburban newspapers early on, as well as a handful of secondary daily newspapers in major cities. Its first major such acquisition was the *Dallas Times Herald*, which it bought from Times Mirror, in 1986; however, the paper was already in financial trouble. Meanwhile, in 1987, MediaNews bought *The Houston Post* and *The Denver Post*. It rapidly built its ranks of mostly small papers with financial backing from Media General and Times Mirror. The company sold off the Dallas paper after 18 months and Houston in 1995. But it kept *The Denver Post*, making it the flagship of the chain as MediaNews collected more small newspapers through the 1990s, making purchases from Thomson, Knight Ridder, and Donrey Media, among others. The bulk of the chain was made up of small to mid-size newspapers; for example, when MediaNews bought the *Charleston Daily Mail* from Thomson in 1998, the West Virginia newspaper had a circulation of 41,507 and was one of the 10 largest properties in the chain of 37 dailies and 111 nondailies.

Singleton appointed himself publisher of *The Denver Post* in 2000, overseeing a newspaper war with the *Rocky Mountain News* while serving on the board of directors for the company. Under his leadership, the *Post* won national acclaim, including having the fifth-highest Sunday circulation of a newspaper in the country, and Pulitzer Prizes. Singleton would later serve as publisher of other properties in the chain, including *The Salt Lake Tribune*.

The 2000s saw substantial expansion in ownership of large properties, with MediaNews acquiring the *St. Paul Pioneer Press* in Minnesota and the *Contra Costa Times* and *San Jose Mercury News* in California from McClatchy as it sold off several former Knight Ridder properties. MediaNews also purchased *The Salt Lake Tribune* from AT&T and *The Detroit News* from Gannett. It sold off a handful of smaller papers to make a move into television and radio, with MediaNews eyeing a multimedia strategy for the 21st century. These moves gave MediaNews additional major properties alongside *The Denver Post*, but also saddled the chain with substantial debt. Scudder stepped down as MediaNews’ chairman in 2009 for health reasons, with Singleton taking his place in 2010 in bankruptcy reorganization.

MediaNews declared Chapter 11 bankruptcy protection in 2010 and quickly reorganized its debt. It emerged months later with its debt significantly reduced. However, the adjustment put a majority of its stock ultimately in possession of Alden Global Capital, which set up its ultimate merger with Journal Register Company. Simultaneously, Alden purchased controlling stock from the bankrupt Journal Register Company in 2011.

Alden created Digital First Media in 2011 as a holding company for its newspaper portfolio, with the MediaNews name continuing as a subsidiary for its papers and 21st Century Media being created as a subsidiary for the former Journal Register newspapers. At the end of 2013, the two subsidiaries were combined under the Digital First Media name. However, the MediaNews Group branding remained as the corporate name. Since the acquisition and merger, Digital First Media newspapers have endured significant budget cuts, layoffs, and overall shrinkage. Denver workers have led a fight against Alden's profit-boosting measures, and Singleton himself resigned as chairman and his seat on the editorial board of *The Denver Post* in 2018, saying of Alden, "They've killed a great newspaper" (Roberts, 2018).

Cost Cutting and Clustering

MediaNews was a pioneer in cost cutting measures at its operations. Singleton began this operation in southern New Jersey at the beginning of MediaNews' operations. Essentially, independently operating newspapers would be merged to share business and production operations. For example, MediaNews decided to cluster operations of two of its southern New Jersey papers—the *Gloucester County Times* (MediaNews' first newspaper) and the nearby *Today's Sunbeam*. In the arrangement, the newspapers shared advertising sales staffs, accounting and business offices, composing rooms, and presses. This model, which looks similar to a joint operating agreement (JOA), except that both papers have the same owners, became the backbone of MediaNews operations and a model for others.

MediaNews' clustering advanced to the closure of several newsrooms and newspapers entirely. For example, the papers in the San Francisco Bay

area, including the *Oakland Tribune*, *Alameda Times-Star*, *Hayward Daily Review*, *Fremont Argus*, *West County Times*, *Contra Costa Times*, *San Ramon Valley Times*, *East County Times*, *Tri-Valley Herald*, *San Joaquin Herald*, *San Mateo Times*, and the *San Jose Mercury News* all were or are produced in MediaNews' Bay Area Media Group, or BANG. At BANG, reporters, photographers, editors, and designers produced multiple newspapers, and their work would regularly appear in multiple newspapers at once, particularly reporting about issues of regional or state-wide importance. Over time, MediaNews closed, consolidated, or rebranded several of these publications and either offered zoned editions to individual communities or contracted coverage areas at the BANG cluster, and at other clusters nationwide.

MediaNews' clusters were not limited to its own papers, however. MNG partnered with other companies, such as Gannett and Stephens Media Group, in ownership and production. Together, their California Newspapers Partnership had consolidated functions of advertising, business, and production for newspapers from the three chains in the region. Ultimately, MNG acquired most of these papers, but made money off of its stake in the partnership in the process.

MediaNews' cost cutting earned Singleton the nickname "Lean Dean" for his tactic of consolidation and layoffs, particularly in business offices. Singleton tried to preserve as much news coverage as possible, but cut editorial in newsrooms as well. However, the deepest cuts were on copy desks, design staffs, and then composing and pressroom operators.

Joint Operating Agreements

Beyond its clustering agreements, MediaNews Group owns or owned five titles that are or were part of JOAs: the *Charleston Daily Mail* in Charleston, West Virginia; *The Denver Post* in Denver, Colorado; *The Detroit News*, in Detroit, Michigan; *The Salt Lake Tribune* in Salt Lake City, Utah; and *The York Dispatch* in York, Pennsylvania. Noteworthy is that when MNG owned and operated these publications in the JOAs in the first decade of the 21st century, these five made up half of all the remaining JOAs at the time. Of

these, Denver's JOA ended with the folding of Scripps' *Rocky Mountain News* in 2009. Detroit's JOA, the Detroit Media Partnership, is under contract until 2087 and was launched under Singleton's watch at the *Post* and MediaNews. *The Salt Lake Tribune* was sold to a nonprofit corporation; likewise, *The York Dispatch* in Pennsylvania was sold to a local family. The *Charleston Daily Mail* in West Virginia was sold to its partner, *The Charleston Gazette*, in 2004; however, the sale was blocked by the Department of Justice and settled in 2010 with MNG retaining a minority stake in the JOA but the *Gazette* maintaining ownership. The papers merged without required governmental notice and approval by MediaNews in 2015.

MediaNews and the Marketplace

Unlike peers Gannett and McClatchy, MediaNews is a privately held company and does not disclose finances publicly. Its bankruptcy and sale, however, gave insight into its operations. MediaNews Group took on significant debt with its acquisitions, but appears to have largely remained profitable through the years. Singleton's cutting philosophy kept profits at the forefront of operations, with its flagship newspaper *The Denver Post* never posting a loss during its fierce war with the *Rocky* when both papers discounted papers to a penny an issue for subscribers. In 2017, the chain reported profits of \$160 million.

Where peer media companies have diversified portfolios, MediaNews is primarily invested in the newspaper industry. The financial backing of Alden, however, is broadly invested in venture capital projects and the profitability of the newspapers is only minimally invested into the properties themselves.

MEN'S MAGAZINES

As periodical publications, magazines have developed into an important part of the media landscape, as they have been credited with original and targeted content, high-level writing, and striking art and design. Magazines mainly serve audiences by interest or topic, unlike newspapers, which usually have audiences defined by location. As special-topic magazines blossomed in the United States during the mid-to-late 1900s, men's

magazines emerged, aiming to reach a gender-specific audience covering topics and featuring art that were considered of interest to a traditionally defined masculine audience, such as stories about sports and photos of women.

As is the case with much of the media landscape, men's magazines also included a wide spectrum of topics and tone—upscale to pornographic, literary to lowbrow, explicitly “male” to subtly “male.” There is no one type of men's magazine, though the unifying factor is this: While the subject matter in these periodicals could certainly be of interest to all, the magazine editors envisioned and aimed to serve a predominantly male audience—covering the topics that it believed were their primary interests. This entry discusses the various types of magazines that have been classified as men's magazines: lifestyle magazines, sports magazines, “lad magazines,” and health magazines. It concludes by discussing the literary aspirations and achievements of many of these magazines.

Lifestyle Magazines

The major men's magazines published stories and content according to their own definitions of what it meant to be a man and have male-oriented interests. Some of these lifestyle magazines emerged as high-end, upscale periodicals—offering stories about leisure activities, photos of fashion, and profiles of celebrities (men and women). These magazines often also featured new and established authors writing stories that could be considered gender-agnostic—in that the subject matter would or could appeal to a reader whether male or female.

Esquire began publishing in 1933 under the leadership of Arnold Gingrich with the focus of the magazine centering on men and leisurely pursuits. Author Ernest Hemingway wrote for the first issue. The magazine would become a place where many literary icons—such as Tom Wolfe, Gay Talese, Truman Capote, F. Scott Fitzgerald, J. D. Salinger, Norman Mailer, and many others—published their work.

Talese's profile called *Frank Sinatra Has a Cold* was later dubbed the greatest story the magazine ever told. In this story, Talese used devices of literature to chronicle the story of what happens when the most famous vocalist in the United

States has an illness that would be a minor matter to most (a cold) but was major for him (and his audiences).

Through the years, *Esquire* was known for its writing and art, including reporting on the Vietnam War (“Hell Sucks” by Michael Herr in 1968), and iconic magazine covers designed by art director George Lois. For example, the September 1965 issue featured a composite image of Bob Dylan, Malcolm X, John F. Kennedy, and Fidel Castro (each with one-quarter of their face showing) as part of a story on who college rebels look up to. Another iconic image was the May 1969 issue in which pop artist Andy Warhol was shown drowning in a can of Campbell's Soup (a spoof on pop culture and Warhol's famous artwork of the brand's cans).

The 40th anniversary issue of *Esquire* from October 1973 was published at 564 pages and touted as not only the biggest magazine in its own history but the largest of any (that the editors were aware of). Largely stories with little art, the issue featured work by many of the country's most prominent writers. The cover featured an illustration of 39 writers; two were women—Nora Ephron and Dorothy Parker.

The 1,000th issue of *Esquire*, published in October 2015, featured a one-page feature that it called the *Greatest Table of Contents of All-Time*, in which it listed 46 items (including a cover) from its past, calling it the perfect issue of *Esquire*. It listed pieces of fiction, features, essays, plus nods to signature elements of the magazine, such as “The Sexiest Woman Alive,” “What I've Learned,” and “ESQ&A.”

Gentleman's Quarterly launched in 1931 as a men's fashion magazine. It was not until the late 1970s that *GQ* was repositioned as a general-interest men's magazine (though still maintaining a strong fashion focus). Like its *Esquire* counterpart, which had such well-known editors as Harold Hayes, Clay Felker, and David Granger, *GQ* had Art Cooper as its iconic editor during much of the magazine's most prominent years. While the breadth of subject matter expanded, the focus on fashion has been prominent, as *GQ* is often considered the *Vogue* of the men's fashion world (*Vogue* and *GQ* are both owned by Condé Nast).

Playboy, which launched in 1953 featuring a photo of Marilyn Monroe, differed from other

magazines in that it also published photos of nude women. It was launched by Hugh Hefner, who once worked at *Esquire* and who became an iconic representation of *Playboy* and men's magazines—living the upscale life, often wearing a robe, surrounded by many women. He became synonymous with *Playboy* and its brand, and Hefner served, in the eyes of some, as the aspirational symbol of what maleness could be.

The magazine wasn't generally considered a pornographic magazine like other more extreme magazines, because the majority of its content centered around lifestyle stories, journalistic pieces, fiction, and celebrity interviews. The *Playboy* Q&A—a long-form interview with a well-known person—was as much of a signature of the brand as were bunny ears and centerfold pictorials. Still, some did call it obscene because of the explicit content and nudity. The 50th anniversary issue, published in January 2004, included a pull-out poster with small, thumbprint images of every cover in the magazine's history.

Sports Magazines

While not technically billed as men's magazines, sports magazines often were thought of as men's magazines because of the historically stereotypical assumption that sports were of interest to men and less so to women. The role of the sports magazines has evolved over the history of the medium. The United States has had a long history of sports magazines. *The Sporting News* launched in 1886 as the publication voice of baseball. *SPORT* magazine launched in 1946, and *Inside Sports* started in 1979. In addition, many sport-specific magazines have developed, with titles on football, basketball, and many other sports.

The major magazine in this space has been *Sports Illustrated*, which launched in 1954. *Sports Illustrated* and other magazines were able to highlight sports in more detail (and often with colorful images) than newspapers, and this served an important role in a pre-cable, pre-ESPN world. *Sports Illustrated* became known as one of the most journalistically muscular publications of its day—not a fawning fan magazine or too insider with statistics and data, as some magazines could be, but rather an independent voice covering the sports world.

Renowned sportswriter Frank Deford, who wrote for *Sports Illustrated*, has said that the primary effect that *Sports Illustrated* had on the literature of sports was in the storytelling. Instead of punchy game recaps in the newspapers, sports writers at *Sports Illustrated* could tell stories with texture, with character development, and in a three-dimensional way.

Sports Illustrated marketed toward a male audience in 1964 when it launched its Swimsuit Issue in 1964, which has historically been the magazine's most popular issue. This issue has regularly drawn criticism, with some saying that the issue had little or nothing to do with sports and everything to do with displaying the bodies of scantily clad women for a mostly male audience.

In the late 2010s and early 2020s, sports magazines have taken a large hit—with *ESPN the Magazine* stopping its print edition and *Sports Illustrated* (under two ownership changes since its original publisher of Time Inc.) drastically cutting staff and reducing frequency. In the case of *Sports Illustrated* what was once a weekly magazine changed to biweekly in 2018 and to a monthly magazine in 2020.

"Lad" Magazines

The late 1990s and early 2000s marked the high point of "lad" or "laddie" magazines—magazines that were aggressively "male" in topics. (Irish journalist Sean O'Hagan is credited with coining the term *lad culture* in a 1993 article.) Magazines in this space included titles like *Loaded*, *FHM*, *Arena*, and *Maxim*. These types of magazines had strong international presence with editions specific to many countries.

Popular in the United Kingdom and then in the United States, lad magazines often covered the subjects of cars, technology/gadgets, drinking, and sex—with many provocative photographs of women. It was common for these magazines to do lists and features highlighting celebrity or soon-to-be-celebrity women—for example, the *Maxim* Hot 100 list.

The first editor of the U.S. edition of *Maxim* was a woman, Clare McHugh. In her initial editor's note in the Spring 1997 issue, titled "So who's the chick?" McHugh addresses the question as to why a woman would want to edit a men's

magazine. For starters, she joked that getting paid to think about the opposite sex would classify as a good time. Saying that the men she hangs around are uncomplicated and don't worry too much about masculinity, she wrote, "They have real lives. They like sports, and babes, and beer," also acknowledging they liked fashion and fitness, as well as care about their jobs and relationships.

While some lad magazines attempted to pivot in the mid to late 2000s by shifting to more sophisticated content, most of these magazines stopped their print editions or went out of business. Some of this may have been due to the unpredictability of the magazine business (especially during the economic crisis in and around 2008), the ease and accessibility for men to get more provocative content for free with the rise of digital platforms, and a general pushback on content that was viewed by critics as a stereotypical representation of masculinity.

Predating these lad magazines were men's adventure magazines or pulp magazines, which were popular from about the 1940s until the 1970s. They featured war stories, tales of fantasy, and art of women. One of the popular magazines of this genre, *Man's Life*, featured illustrations often depicting some sort of violence (animal attacks) and/or women with low-cut tops. Coverlines often featured the word *sex*. Called the *arm-pit school* of journalism, these magazines died off with the advent of magazines that featured more explicit content.

Popular digital sites such as The Chive and Barstool Sports embody some of the same content and approaches that the lad magazines utilized during their popularity, with the major distinction being the absence of a printed product.

Health Magazines

When magazines with a special focus on health and lifestyle emerged, they existed in different forms. For example, *Prevention* launched in 1950 as a general-interest health magazine, *Cosmopolitan* (though it had existed since the 1800s) changed to a women's magazine in the mid-1960s, and *Self*, which was targeted toward women, was founded in 1979. Existing men's magazines revolved around lifestyle and leisure, but not health and wellness.

In the late 1980s, men's magazines focusing on health came into the landscape with such titles as *Men's Health* and *Men's Fitness*. While somewhat different from one another in their approaches to content, these magazines focused on fitness, nutrition, sex, general health, stress, and more. Content focused on two general demographics—the men who wanted to lose weight ("Lose Your Gut" was a popular coverline) and the men who wanted to add muscle ("Rock Hard Abs" was another). *Men's Health* made headlines in the media world for its large circulation, and some would credit its black-and-white covers in a sea of neon lettering on the newsstand for one of the reasons why it stood out. In the case of these men's health magazines, the idea was to provide information that would help men improve all aspects of their lives in an aspirational way, yet with the information aimed at those who considered themselves more "average man" than "upscale man."

In the 25th anniversary issue of *Men's Health* in 2013, editor Bill Phillips wrote that so-called experts thought the magazine wouldn't survive. "Men don't care about health, fitness, relationships, nutrition, or style, they said. You proved them wrong."

In 2000, *Men's Health* experimented with expanding its audience by launching *MH-18*—a similar magazine covering similar subjects, but for a teenage boy audience. *MH-18* stopped publication in 2001.

Though lifestyle magazines such as *GQ* and *Esquire* do cover health, those areas are not primary subjects within their pages. The late 1990s and 2000s also saw men's magazines with a hybrid approach to health and wellness content, as magazines such as *Men's Journal* featured ample health content, in addition to lifestyle and general-interest stories and art.

Men's Magazine Achieving Excellence

While some men's magazines throughout history have been both popular because of and criticized for their depiction of women in their pages, many magazines that have a traditionally male demographic have also served as the home for well-renowned authors and critically acclaimed work.

For example, *Esquire*, *Sports Illustrated*, *GQ*, and *Men's Health* have all won or been nominated for National Magazine Awards, long considered the most prestigious awards in the magazine industry. *Esquire* is considered one of the places in which the New Journalism (or literary journalism, as popularized by the likes of Tom Wolfe and Gay Talese) began.

While women-focused magazines have traditionally been the more foundational home for service journalism (i.e., how-to) stories, men-focused magazines have generally been more deliberate in combining lifestyle and service journalism with more traditional forms of storytelling and narrative journalism.

MIDDLE EAST

There are a variety of ways to define the region known as *the Middle East*. One common one includes focusing on a variety of Arab nations including those in the Gulf area (Bahrain, Qatar, Saudi Arabia, United Arab Emirates, Yemen); North Africa (Algeria, Egypt, Libya, Morocco,

Sudan, Tunisia); and the East Mediterranean region (Iraq, Jordan, Lebanon, Syria). The latter includes Palestine as well as the non-Arab nation of Israel—both of which are recognized as nation states by the majority of the United Nations member states. But because of Israel's complex geopolitical history only two of its Arab neighbors (Egypt and Jordan) have formal diplomatic relations with it.

After reviewing the development and emergence of journalism in this region, this entry focuses on Arab media systems, emerging trends, and key events that have influenced the media landscape.

Emergence of Journalism

Media developed and journalism emerged in this region in the mid-18th century under Ottoman rule with the establishment of newspapers and print presses in Iraq, Egypt, and Syria. Newspapers were tools of Ottoman authorities and operated as such. The independent Arab press did not emerge until the mid-19th century. Notably, at the time, Egypt was a flourishing liberal cultural and intellectual center of the region. Syrian and Iraqi journalists suffered from censorship so they moved to Egypt where press freedom was guaranteed. It was these Syrian-Lebanese journalists who established the modern Arab journalism model based on a revival of past Arab glory and literature. It was during this renaissance that the renowned Egyptian *Al-Ahram* newspaper was launched in 1875. Except for official Ottoman publications, local newspapers in other neighboring countries including Palestine did not appear until the 20th century, although the history of press can be traced back to the establishment of the religiously oriented publications *HaLevanon* and *Havazzelet*, the first weekly Hebrew publications, and *Quds-iSherif*, the first Arabic publication.

After the Ottoman rule ended and was replaced by mostly French and British colonialism, a new press emerged in Morocco, Tunisia, Syria, Lebanon, and Palestine. Although marked by censorship and restrictions, the profession managed to grow under a largely repressive environment.

Journalists learned to negotiate their roles by circumventing or accepting censorship and authoritarianism. But that did not stop the Arab press

who by 1945 became the beacon of nationalistic journalism and introduced the tradition of literary journalism, which helped carve out an influential position for them in society. The press became revered for its role in fighting for Arab nationalism, reformation, modernization, and democratization. They were also renowned for their opposition to the 1948 creation of Israel. This period became known as the golden time of pluralistic politics and journalism. In parallel and with equal drive, the pre-State Hebrew press had clear agendas linked to politics. The politician-journalist phenomenon dates to the earliest days of the Zionist movement in Europe, which continued after the establishment of Israel. The interwoven relationship had an important impact on Israeli journalism giving the press a unique role to play during its formative years.

As coups and revolutions occurred in several countries in the region during the 1950s and 1960s, a rise in dictatorships dulled Arab journalism and turned most of the media in the region into political weapons for many decades. It was not until the 1990s that the arrival of the Internet and satellite television and the ironic launch of the Qatari government-financed TV Al-Jazeera channel marked the end of one of the worst times for Arab journalism. Al-Jazeera TV was not originally created to be a focus of journalistic freedom in the region, but rather to challenge the dominance of Saudi Arabia's regional influence in pan-Arab media. This ushered in the pre-Arab Spring era of mixed levels of media freedoms and government interference. Journalists were inspired, including those who worked in government-owned news organizations. They began to push the envelope again and challenged the powers.

Fast forward to the present, and Arab journalists may not have the freedom and sense of power felt during the lead up to the Arab Spring era because the upheavals of 2011 resulted in civil wars and more authoritarian political systems rising to power. But journalism survives, albeit minus the passion perhaps.

Arab Media Systems

Arab media systems and political cultures are interwoven. One view is that media changes often reflect changes in domestic politics, while an

opposing view is that technological, political, and social developments create changes in the media. Media in the region have developed at a much faster pace than the political systems. This triggered democratization, despite periodic political setbacks, putting the media together with civil society at the forefront of political and societal changes.

Media had been dominated by the state or state-sponsored power elites and characterized by insulation from the outside, but technological innovations of the 1990s brought new content and a wave of liberalization and privatization to the public. For the first time, Arab governments consciously allowed, and even promoted, these changes in order to counter global and transnational competition.

At this point, the major players (Egypt, Lebanon, Saudi Arabia) introduced television channels and increased "cable news style" talk show programming. Arab journalists across the region used this opportunity to revive their profession by discussing a wide range of topics such as economic, social, and religious issues—previously seldom discussed and mostly unknown to viewers.

As a result of government loosening of regulations, a near unintended emergence of a dynamic public sphere was witnessed mostly in television and aided by the introduction of the Internet. Governments were focused on the perceived economic benefits of the Internet and missed the growth of unrepresented alternate voices, diverse views, and even public dissent.

Because Arab media systems continued to liberalize, a new dynamic between Internet activists and mainstream media journalists and professionals took place before and leading into the days of the 2011 protests—indicating that media, both old and new, may have indeed moved ahead of the political changes that were to occur shortly.

Israel

To discuss the region's media fairly, it would be difficult to include Israel as its media system is quite unique to that of its Arab neighbors. To a certain extent, Israel cannot be classified with most of its neighbors who function most commonly in authoritarian societies that frequently employ authoritarian-type press models. But to

describe the Israeli press system as operating in a liberal democratic model or social responsibility model is also not precise if official military censorship and the history of warring with Arab countries is considered.

Nonetheless, prior restraints and other severe measures of curbing press freedom in recent decades has not involved censorship but instead court order and rule of law limitations. Much of the media in Israel is privately owned and independent, indicating the classical characteristics of a liberal press system. It has also become adversarial, confrontational, and increasingly critical of government policies even during more contemporary conflicts such as the 2006 Lebanon War. Israeli journalists in general are advocates of social issues and critics of internal domestic affairs.

Israeli media also cater to the two largest linguistic minorities of Russians and Arabs, who tend to consume media in their first language, with the Russian media being more economically vigorous, mostly for cultural reasons.

The 1980s was a period of expansion for television and radio news putting pressure on the print press industry. This increase expanded after the government enacted a broadcast reform opening up a new private television channel, the *Arutz Shnayim*, in 1993, leading the way to further additions. As for Internet usage, Israel's rate is among the highest in the world with a reported 84% penetration rate and social media usage of 70% in 2020. These figures are among the highest in the region and often are double, if not triple, of those in other countries in the region.

Regional Journalism Post-Arab Spring

Arab journalists were able to operate with fewer restrictions immediately after the extraordinary wave of popular protests of 2011. Massive popular mobilization brought down long-ruling leaders in Tunisia and Egypt; helped spark bloody struggles in Bahrain, Libya, Syria, and Yemen; and fundamentally reshaped the nature of politics in the region. There is no consensus on the exact impact of traditional or social media on the collective action or regional diffusion of the protests, but there is no doubt that media was important.

If nothing else, journalists, for yet another brief period, were free from restrictions. In those heady days, most media in Egypt, the most populous country in the region, rallied behind the protest. Early signs of a classical democratic public sphere emerged. Government officials were drilled on television, political satire shows flourished, and opinion columns printed alternate views. Similar signs could be seen in other countries. However, the rebirth of quality journalism quickly degenerated into turmoil. An environment of polarization and sensationalism fostered ugly political trends.

Emerging Trends

The media landscape in which Arab journalism resides continues to change. The political context across the region remains varied and volatile, exacerbated by wars, internal strife, and more recently a lethal global pandemic.

Firstly, pan-Arab satellite television stations such as Al Jazeera and Al-Arabiya and later the digital media domain, such as blogs and social media networks, have contributed to a rise or even a resurgence of long-forgotten transnational Arab and Muslim identity, making them immensely popular. But they lost their force after getting involved with regional power struggles and presenting one-sided coverage of major news events, leading to a resurgence of nationalism in several Arab countries and resulting in a rise of national media. Private television stations have increased in quantity, becoming an attractive vehicle to reach large audiences. Egyptian channels such as Dream TV, El Mehwar, Al Hayat, Sada El Balad, CBC, and DMC are alternatives to the pan-Arab channels for both citizens and journalists.

In Algeria, private channels have also proved to be successful in creating a new national public allowing journalists to provide more choice in terms of national and regional news. These news channels, like Echourouk, Ennahar, and Dzair News, gained quick credibility among an audience that previously had little or no trust in national media.

Tunisia—the only nation characterized as a democratizing country following the uprisings—has had media reforms and an increase in press freedoms. However, the media of this fragile transitional country has been criticized for ideological

polarization. Journalists now have several stations to air their coverage, such as El Hiwar El Tounsi, Nessma TV, and Hannibal, alongside the reformed state stations of Watanyia. Even the failed states of Libya and Yemen witnessed an increase in private although biased stations.

Such examples underline the changes in the media and consequently the journalism profession, but it should not completely undermine the importance of the transnational media or the pivotal actors in the media landscape such as Saudi Arabia, United Arab Emirates, Egypt, or Qatar. In addition, many prominent journalists and media professionals have moved to international broadcasters where their freedoms are better protected. Prominent Arab journalists work for these stations—such as Al Hurrah, Radio Sawa, BBC, CNN, Deutsche Welle, France 24, Russia Today, and CCTV—despite their moderate viewership.

Another clear trend is the marked increase in digital media and its accessibility. As of 2020, the number of Internet users is more than 125 million, with penetration rate of 67%, rising from 28% in a decade. More than 53 million people use social media actively.

Improved infrastructures, rapid expansion of Internet connectivity, and affordable devices have spurred this growth, not only in the more affluent economies of the Gulf States, such as the United Arab Emirates or Saudi Arabia, but also in less affluent countries like Morocco and Sudan. This growth in Internet penetration has also allowed for much free space for alternate opinions, despite government attempts at suppression.

Smartphone ownership growth has paralleled increased Internet use. Over 80% of nationals in countries like Lebanon, Qatar, Saudi Arabia, and the United Arab Emirates own a smartphone. More and more citizens are becoming dependent on social media platforms for many of their communication needs.

Digital media is not just increasing in quantity, but consumers are also changing the way they use it. Half the population of the Arab region is under 30 years old. This *youth bulge*, which is the term used to describe the proportion of Arab youth in comparison to older groups, is increasingly engaged with digital media. Because of this trend, and the fact that young people are early adopters of new technologies and extensive users of digital media,

governments, industry leaders, and scholarly researchers are keeping an eye on how they consume, interact, and create media. A rapid expansion of user-generated content in the Arab region since 2010, mostly disseminated via social media, has significantly altered the cultural and political landscape.

Consumption is changing among young people. Youth are consuming digitally and moving further away from the print press, and even though television is still the most popular news platform, at least one third of youth respondents access news content via social media often from non-news organizations. Importantly, youth also share news extensively via digital channels, giving journalists a novel platform to disseminate their work and avoid illicit government surveillance of online activity. Popular platforms in the region include Facebook, Twitter, Instagram, WhatsApp, and TikTok.

Key Events

The aftermath of the Arab Spring has not been good for most of the region's media. Many of the existing regimes or rulers that survived the upheavals returned to old-time well-known repressive tactics using familiar justifications such as preserving national security or counterterrorism narratives to suppress journalists. Today, many journalists are being imprisoned for their coverage and opinions. By 2019, there was a second wave of protests—in Algeria, Lebanon, Iraq, and Sudan. As of late 2020, 89 journalists were imprisoned in 10 countries in the Middle East and North Africa. Harassment and murders are hard to verify, but the 2018 murder of Saudi journalist Jamal Khashoggi has been linked to the Saudi government.

In recent years, Arab journalism has experienced some of the worst press freedoms in the world today. Citizens may feel increasingly empowered by social media, but many Arab governments have responded with a series of violent practices and new laws to control voicing of opinions.

Press freedom indexes like Freedom House rank six Arab countries at the bottom of 180 states—Bahrain, Egypt, Libya, Saudi Arabia, Syria, and Yemen. Not a single Arab country made it to

the top 30 in 2020. In fact, Tunisia was the only nation to make Freedom House's list of free press countries. Jordan, Kuwait, Lebanon, and Morocco made their partly free list. While Algeria, Iraq, Oman, Palestine, Qatar, Somalia, Sudan, South Sudan, and the United Arab Emirates rated as not free countries.

Censorship against journalists is rampant. The media in Egypt has become dominated by pro-government outlets. Many other media were shut down. What remains are private media owned by government-favored businessmen. This causes journalists to self-censor.

Prison is a common destination for journalists as any critique of government can be punished by a jail term, despite the adoption of constitutions that protect press freedoms. According to Reporters Without Borders, at least six journalists were detained in 2019 and 26 were already imprisoned. For instance, offices of the independent news outlet Mada Masr were raided and four staffers arrested and released. A few months later, the editor in chief was arrested and released.

Possibly the most horrific example of state violence against journalists was seen in the case of Jamal Khashoggi, the Saudi journalist who was murdered by Saudi operatives inside the Saudi consulate in Turkey for his criticism of the government and ruler.

It has also been reported that Saudi Arabia keeps over 32 journalists and citizen journalists in jail. The government controls local media content and heavily influences regional print and satellite-television coverage.

Online activity is closely monitored by governments. Egypt has barred many news websites and regularly blocks up to 30,000 Internet domains during politically sensitive moments. The Saudi government has developed a sophisticated system of social media surveillance and uses automated bots to sway and manipulate public opinion trends in social media.

In countries suffering from internal strife, such as Yemen, the warring factions have either taken over or enforced censorship on all media in the country. In Yemen, it is reported that Houthi-backed authorities regularly block certain news websites, satellite broadcasts, and social media platforms. The Saudi-led coalition has also reportedly violated reporters. War has been dangerous

for journalists—who are frequently attacked, harassed, arrested, and sometimes disappear.

Yet, despite this bleak looking picture, many youth, in countries like Syria and Yemen, have taken their smartphones, cameras, and pens and gone out to cover and report important events for the first time. They sell stories to international news agencies, and upload others directly to the Internet, bringing vital news to the world.

Tunisia began a transition to democracy after removing their corrupt longtime president in 2011. Press freedom has improved much since the change of system, and many independent media operate freely in the country. However, journalists reportedly do face intimidation from the Tunisian government which has expressed concern about the political influence on private media outlets.

As for the status of Israeli media, it is much more secure than that of its neighbors as it is a multiparty democracy with strong and independent institutions that guarantee political rights and civil liberties for most of the population. It is, however, criticized for its discrimination against Arabs and other ethnic minorities. On press freedom indexes in 2020, it is rated free but ranks at 88th place lower than Tunisia on the Reporters Without Borders scale. Still, the media sector on the whole is vibrant and free in comparison to 180 countries ranked worldwide.

MILITARY AND THE MEDIA

This entry reviews the history of military–press relations, spotlighting U.S. military operations and the evolution of battlefield censorship and war journalism from the mid-1900s, through two World Wars, the U.S. involvement in Korea, Vietnam, the Gulf region, and up to the early decades of the 21st century. For almost 200 years, the relationship between these institutions has been marked by the struggle to balance citizens' right to know with the Armed Forces' goal to provide defense and military secrecy. The military depends on the support of the American public to authorize and fund its operations and missions. The First Amendment to the U.S. Constitution

guarantees freedom of speech, and the idea of the Fourth Estate exemplifies the media's responsibilities to inform the public and provide checks on governmental action. During almost all major past conflicts, the U.S. military imposed restrictions on the flow of information, arguing that wartime secrecy would safeguard the success of military actions. In previous battles, members of the press have also engaged in self-censorship.

Keeping the public informed, staying independent, and sourcing a variety of perspectives is hard to do well when working in distant battles and conflict zones. The U.S. military has routinely embedded reporters since World War II. Military–press relations have been impacted by new reporting styles, technological advances, public criticism over warfare and mismanagement, and recurring debates about journalistic professionalism in war and peace. Across the world, reporters continue to find ways to negotiate the challenging and long-lasting relationship with censors, intelligence and military officials, and the public, which journalists serve.

The 19th Century

The British military practiced rigid censorship of news during the Crimean War (1853–1856), and reports on battlefield action were either held back or not allowed to be published. In North America, during the Mexican-American War (1846–1848) American newspapers—the primary vehicle for information—assigned full-time correspondents to cover military action. News was relayed by boat, train, and horseback, as well as via the telegraph, and often took several days to arrive at media headquarters in the North, particularly in New York City. During this period, journalism and correspondents posed little threat to military operations and criticizing American troops. Scholars of this period have noted that visual reporting began during the invasion of Mexico but did not greatly impact American public opinion.

This changed during the American Civil War (1861–1865), when visual media and photography, in particular, became important elements of war reporting as well as a means to chronicle history, even though this historical truth was often constructed or arranged. In addition, the telegraph, spanning a 50,000-mile network of lines,

provided news of the war, at high speeds across the nation. “War is a very old story, but it is new to this generation of Americans,” wrote publicist Oliver Wendell Holmes Sr. in his 1861 *Atlantic Monthly* piece (p. 6). Major technological leaps opened up new possibilities for how reporters on the ground could send eyewitness accounts to their editors. While only a few journalists covered the combat during the Mexican American War, by the 1860s, this number had expanded to about 500 journalists. These reporters covered frontline actions and moved freely among the troops. Some officials, including Union General William Tecumseh Sherman, criticized the presence of the media, calling reporters a security threat. In an effort to control the narrative and restrict information, the Union War Department engaged in the first widespread censorship during war in U.S. history. The Union Army’s censorship measures ranged from fining newspapers, to delaying or closing publications, and to even jailing journalists for short periods of time. Some newspapers engaged in voluntary press censorship to help the military’s cause.

The conflict also gave rise to mass political propaganda and partisan news, which influenced wartime morale and public opinion on both sides, according to David W. Bulla and Gregory A. Borchard. By the 1890s, professional correspondents, such as Richard Harding Davis, were widely read. This golden era of wartime correspondents meant there was minimal pressure and military restriction on what to write and publish. During the Spanish-American War (1898), Davis reported on Theodore Roosevelt’s charge in Cuba, framing Roosevelt as a decisive man of action; this image energized Roosevelt’s presidential race in 1901.

Early 20th Century and World War I

During the Great War (1914–1918), all governments tied up in the conflict rushed to control information infrastructure, content, and channels. Wartime media governance took on both suppressive and expressive forms. States used mass publicity campaigns, coupled with censorship, to achieve one primary goal: molding thought and coercing the public to support governments’ military and political goals. Historians have chronicled the various censorship practices during the

First World War (Demm, 2019) and offered comparative analyses of national propaganda efforts (Lasswell, 1927).

Fear of Espionage and Limiting Freedom of Speech

The United States entered the conflict in Europe in early April 1917 and what followed was a set of constitutional changes to the First Amendment that restricted press freedom. The Espionage Act (1917), Trading with the Enemy Act (1917), and Sedition Act (1918) were passed to prevent the disclosure of intelligence secrets. The fear of espionage was shared by most countries engulfed in the war. The U.S. Congress passed the Espionage Act on June 15, 1917. This law—which has been controversial since its inception—aimed to protect military intelligence and made it illegal to share classified information or secrets. It targeted German spies who supposedly worked to collect intelligence and plan acts of terror or sabotage within the United States.

Although the law was intended to prevent “classic” espionage activities such as sabotage and the disclosure of secrets to the enemy, later it also limited freedom of speech during times of crises. Postmaster General Albert Burleson was given the authority to revoke mailing privileges—on which most immigrant papers relied—for suspected publications. The Trading with the Enemy Act of October 6, 1917, forced all foreign-language publications to file daily English translations with local post offices on all political news and commentary about the war. For German-language newspapers, these repressive conditions changed their businesses model, as readers and advertisers withdrew their support, and editors had to signal public support for U.S. war aims and the government’s point of view (Fondren, 2019).

Committee on Public Information

Less than a week after the U.S. entered the war, President Woodrow Wilson appointed veteran reporter and publicist George Creel as the director of the Committee on Public Information (CPI)—the United States’ first government propaganda agency. CPI director Creel issued a censorship card, which Wilson edited himself, to U.S.

newspapers and magazines. The card included sensitive war topics and asked journalists to practice restraint on publishing stories that had not gone through official censorship. The topics were categorized into dangerous material that should not be published, such as current military operations; unverified news including rumors and stories on warfare technology had to be cleared with CPI censors before publication; and material that was unrelated to the war, which editors were allowed to publish. According to Michael S. Sweeney, this form of voluntary censorship was a form of disguised government control and coercion cloaked in appeals to common sense and patriotism. Scholarship has found that the U.S. press was for the most part uncritical: "It was not servants we wanted, but associates," reflected Creel after the war (Creel, 1920, p. 17).

World War II

During the Second World War (1939–1945), the media and correspondents had unprecedented access to frontline news and events, and hundreds of journalists were embedded with U.S. troops. Large government and bureaucratic institutions were created to control and produce wartime information. The U.S. government, under the helm of President Franklin Delano Roosevelt, who had worked as assistant secretary of the Navy during World War I, decided to decentralize wartime media governance and keep censorship and propaganda separate. Through executive orders, President Roosevelt created two federal agencies, one for censorship (Office of Censorship) and one for publicity (Office for Wartime Information, or OWI).

The Bureaucracy of Censorship and Propaganda

Since December 1941, the Office of Censorship, led by former Associated Press Executive Editor Byron Price, controlled the censorship of domestic news. The agency issued a long list of censored topics in its *Code of Wartime Practices* and demanded that the media, in signaling patriotism, avoid publishing stories about the movement of troops or the location of war or ammunition factories. This form of voluntary censorship—or

pre-censorship—was instituted, and according to chief wartime censor Price, journalists knew that if they did not comply, compulsory censorship would be forced upon them. Only one journalist, a radio station manager in New Mexico, openly violated this code when he criticized Price's request to monitor foreign-language programs. Most journalists, however, accepted this self-censorship code. U.S. journalists did not publish information about major national security decisions, for example the program to develop an atomic bomb. Months before the first atomic test on U.S. soil, investigative reporter Andrew Russell "Drew" Pearson uncovered this information.

In addition to controlling information, countries also ramped up their efforts to produce war news, publicity, public relations, movies, magazines, and millions of other printer matters. Established in June 1942, the OWI, led by experienced radio journalist Elmer Davis, coordinated American propaganda directed at most other countries. The agency's efforts to publicize information abroad were often criticized from within the U.S. government, and the OWI also struggled with military officers' reluctance to share complete, accurate, and timely information. Before the OWI ceased its operations in 1945, the U.S. Congress had reduced the OWI's budget over concerns that it had become a partisan instrument.

Self-Censorship and Images of War

During the war, more than 1,650 American journalists covered the frontline fighting and reported news, stories, radio programs, and pictures to audiences back home. Many of these journalists considered it their patriotic duty to do their part in America's massive war effort. At the same time, journalists often self-censored their photographic work and even radio broadcasts, avoiding pictures of war violence, destruction, and deaths, knowing these images would not clear military censorship. American journalists also self-censored news before the United States' official declaration of war, for instance, in late 1939, after the fighting had begun in Europe, reports in American papers held back information about the movement of Canadian troops (Sweeney, 2001). The U.S. government did not release pictures of dead and killed American soldiers until the fall of

1943, when the OWI decided that these images might boost the public's support for U.S. war efforts as part of the "why we fight" propaganda. Photos of dead American soldiers, submitted but held back by censors, were sent and recorded in the infamous file known as *Chamber of Horrors* at the Pentagon.

During World War II, radio journalists, who had covered the fighting during the Spanish Civil War (1936–1939) rose to new prominence but also faced stricter military censorship due to the medium's immediate and widespread distribution, according to Sweeney. Perhaps most famously, CBS radio journalist Edward R. Murrow reported from the rooftops during the London blitz raids. Journalist Martha Gellhorn ignored American military restrictions on female war correspondents, stowing away on a hospital ship to gain a firsthand account of the Allied invasion of France in 1944. She reported from the beaches of Normandy in a nurse's uniform and provided frontline stories for *Collier's Weekly*. One of her most memorable accounts was a story on the liberation of the Dachau concentration camp, in which she described the horrific conditions of inmates.

Korea and Vietnam

While the relationship between the military and the press was amicable during World War II, this changed during the Korean War (1950–1953) and Vietnam War (1959–1975). In Korea, military–press relations were similar to those of the Second World War, with journalists reporting from the front lines. The news that correspondents and combat journalists were sending back home was not subject to absolute military restrictions, except for a short time span after China's intervention in Korea in late 1950. Scholarship has found that journalists covering the Korean War, continued to exercise self-censorship, which often meant leaving out the grim realities or photographs of combat. One example of this practice is when journalists, who were aware of the massacre of South Korean civilians at No Gun Ri, either ignored this news or treated it as insignificant. While tensions between the press and military censors increased during the Korean War, journalists mostly remained supportive. This was in part because

the conflict started with a communist invasion at the height of the Cold War.

Television News and Press as Critics

After the advent of daily television, the news coverage during the longer Vietnam War changed in comparison to the Korean War and increasingly included more graphic images and news reports. Rigid censorship was near impossible and the U.S. military—which fought without a formal declaration of war and would have needed the approval of the heavy-handed South Vietnamese officials—did not impose vast press restrictions on journalists or the news they were gathering. The absence of any official censorship meant that the U.S. media could write, report, and film what they saw. Scholars have argued that the Vietnam War marked a turning point in government–press relations, precisely because the absence of military surveillance on press went hand-in-hand with the rise of television news, which relayed the grim and brutal truths of American warfare to a global audience's living rooms.

Practically, the chaotic guerilla-style conflict, stretching out over a wide area, made it nearly impossible to stop journalists from reporting the realities of grim warfare, or to require correspondents to send their news and photos to military censors. Reporters were generally allowed to report any news that was not classified. While U.S. troops provided transportation to combat zones, reporters also hitched rides without formal permission and were able to access unfiltered news and connect with local sources. The U.S. government, nevertheless, monitored and tried to restrict journalists' movements. In response to the 1968 Tet enemy offensive—which was widely covered and shattered U.S. military's announcements and audience's hopes that the war could be easily won—journalists openly criticized the official narrative. CBS Evening News anchorman Walter Cronkite, one of the 20th century's most influential media figures, broadcast an editorial that he saw no future but military stalemate in South Vietnam. U.S. President Lyndon B. Johnson, who had been subject to growing criticism and public anger over the war, announced 5 weeks after Cronkite's broadcast that he would not seek reelection.

Public Opinion and Journalists as Participant-Observers

The Vietnam War influenced the professional ethos of journalists, as they became “participant-observers” (Taylor, 2013, p. 453). In his “Letter from Vietnam” series for *The New Yorker*, American foreign correspondent Robert M. Shaplen provided some of the best analytical reporting on the Vietnam War. Scholarship has also emphasized the role of television news and film crews, which provided powerful, close-up, and constant views of Americans in combat. These images galvanized public opinion and antiwar protests in the United States and around the world. Television crews sent their film material by plane to the United States instead of transmitting via satellite. This meant that visual news and television coverage showed events that had already occurred a few days prior.

During the war, reporters covered the Tet Offensive, street execution of a guerilla fighter, and U.S. forces burning civilian villages. These televised news stories allowed audiences to see the chaos, confusion, and often violence in a way that print journalism and words could not communicate. Together with news and information covered by print journalists, television broadcasts undermined the military’s official narrative and publicized optimism that it would win the war. Increasingly, journalists’ distrust in official information grew, for instance, they called the military briefings *The Five O’clock Follies*. The facts that reporters gathered in the field, the images they saw, and the civilian suffering they witnessed did not match up with the government and military perspectives, resulting in a credibility gap. After the end of the first television war, both military commanders and political observers continued to assess the power of television images during war. Others argued that the flawed strategy and high body counts rather than adverse press coverage brought about the vast rift in how the public perceived its government actions and this deeply divisive conflict.

When the war ended, trust between the military and journalists was at a record low. Military elites also accused journalists of bias, of using corrupt sources, and of spreading inaccuracies. In 1982, U.S. Army Chief of Staff General William Westmoreland filed a \$120 million libel case against

CBS over the network’s investigative documentary, *The Uncounted Enemy: A Vietnam Deception*. Westmoreland dropped the case before a jury reached a decision; however, the CBS documentary and the public allegations of high-ranking military officers against him received widespread interest.

Gulf and Iraq Wars

During the period that followed the Vietnam War, the level of distrust and skepticism between the military and the media increased. The U.S. military tightened censorship and reenforced its control, which meant restricting media’s access to battles and operations in the 1980s and 1990s. For instance, the military restricted journalists’ reporting from invasions in Central America in the 1980s (Grenada, 1983; Panama, 1989). The Gulf War (1990–1991) and Iraq War (2003–2011) solidified a new pattern of military–media relations, where military managed the access and perception of war news, and journalists could no longer report with absolute autonomy. Independence became a new hallmark for journalists who had to work with—but often around—official sources to verify information and provide a balanced picture. The Falklands War (1982), in which the British fought successfully with Argentina over the stretch of islands, was an instructive case study in generating pro-war publicity and strict censorship for U.S. military officials. All access to the Falkland Islands was controlled by the Royal Navy, and news, visual reporting, and photos from the fighting were heavily censored to reflect the British standpoint.

Restricting Access to Frontline Battle

During the invasions of Grenada and later Panama, the U.S. military used this model to restrict journalists’ access and witnessing combat. The Pentagon created a large bureaucratic apparatus to control information during the 1990–1991 Gulf War to liberate Kuwait from Iraqi forces. Under what is known as *Annex Fox-trot*, journalists in warzones required military escorts. In addition, press pools and military censorship were used, much like the Japanese army

had instituted vast press control in 1904. The sophisticated set of methods that military commanders relied on worked for the military. Out of 1,200 journalists, only 130 correspondents were admitted to the press pools. This number grew to 192, but journalists found that their military escorts sometimes overstepped their boundaries and their sheer presence intimidated sources during interviews. Information was heavily censored and pool reports were often delayed. Nevertheless, some journalists provided memorable—and highly controversial news—from the heart of the enemy's capital. In what has been called the *CNN effect*, cable news' 24-hour coverage from inside a Baghdad hotel was a milestone in television and war reporting. Scholars have noted that embedding journalists can help both sides, the military and the press. Yet journalists, having increased and secured access to news, can also be co-opted by the Pentagon's news agenda and narratives, since they might empathize with troops and internalize the military's logic, according to Heinz Brandenburg.

Embedding Program and Unilaterals

During the 2003 invasion of Iraq, the Pentagon embedded 600 journalists, following much frustration with the coverage of the Persian Gulf War. The expectations for embedded reporters were high: Their frontline coverage should provide an accurate picture of combat, not question the United States' claims that Iraq had weapons of mass destruction, and counter claims of Iraqi officials about abuses American troops would make. During the course of the war, some journalists refused to give up their independence (in exchange for better access and protection in war zones) and reported under great risks. The military called these reporters *unilaterals* and some reporters, such as CBS journalist Bob McKeown arrived in Kuwait City earlier than the press pool. Scholars agree that unilaterals reported information that military authorities "tried to hide or spin" (Sweeney, 2006, p. 177). In 2004, CBS's *60 Minutes* program revealed torture photographs of American soldiers abusing Iraqi prisoners at the Abu Ghraib prison. Scholarship on indexing and sourcing, such as that by Andrea A. Hickerson and colleagues, has found that these photos and the

scandal that resulted did little to change journalists' reliance on military sources in the aftermath.

Citizen-Activist News and Digital Media

Amidst continued uprisings and conflicts since the late 2000s, scholars have studied the limits of military and bureaucratic control—as well as the influence of internet technology—on war coverage worldwide. In the early 2010s, the world witnessed the Arab Spring protests (2010–2012), a series of anti-government protests in several countries in the Middle East. Citizens and journalists used emerging media technologies to report the events. In the aftermath of the uprisings, however, authorities in the Arab region and Africa tightened their grip on online journalism and freedom of expression by extending repressive speech laws (UNESCO, 2018). In 2011, WikiLeaks, a crowd-funded website that exposed massive data and information about government action, CIA intelligence, and military secrets, published secret files about prisoners detained in the U.S. Guantanamo Bay detention camp. In another blow to government authorities, in 2013, former CIA-contractor Edward Snowden leaked information to journalists, revealing the vast extent of the National Security Agency's espionage practices on journalists and ordinary citizens. New technologies and social media make it harder to restrict information from wars and conflict zones. The Syrian civil war, which began in 2011—and has become too dangerous for many Western correspondents—has seen the rise of the "collaborative news clip," in which legacy media use eyewitness content from Syrian citizen journalists in multimedia videos and live blogs.

Outlook on Military–Press Relations

The tensions between the military and the media range back almost 200 years and have been the focus of much scholarly debate. Historically, restraints on free speech during wartime have created conflicts with members of the press and the public. In the future, too, military operations will require some measure of secrecy. In past conflicts, military censorship has been imposed from the top down by authorities, but this is no longer possible in an era of mobile phones, multimedia

stories, video content that can be livestreamed, and Internet access that penetrates the globe. Moreover, journalists are less dependent on the military to assist with safe and speedy communication modes. Government institutions no longer have the gatekeeping power, which they exercised in conflicts since the mid-19th century. While agencies such as the National Security Agency can screen, intercept, or stop news and reports, the public would likely scrutinize such undemocratic use of power. News and war reportage will continue to shape people's perception about the military's operations, successes, strategies, and important humanitarian aspects such as how civilians or enemy prisoners are treated. In the online environment, issues such as journalists' autonomy, the role of online warfare, cyberattacks, and cooperation with whistleblowers and platforms leaking classified secrets have all changed the complexity of reporting on military and national security issues.

MOBILE JOURNALISM

The practice of mobile journalism involves reporters using portable electronic devices to create and distribute news content. There are many tools that facilitate the process, including mobile apps, tablets, smartphones, and add-on gear, such as a stabilization gimbal or specialized camera lenses, that can enhance the quality of the content captured. There is a wide range of storytelling that can be produced using these devices—everything from documentary-style videos to infographics to 360-images and live news coverage. Mobile devices and apps also generally include the capacity to share content directly to social media and other digital platforms, as well as into traditional newsroom workflows, so that the content can be easily disseminated over the air during a live newscast or via a streaming platform, published on a website, or shared directly to a mobile news app, for example. This entry discusses the development of mobile journalism, the technology that made it possible, and the impact on journalists.

Mobile Beginnings

The first recorded instance of mobile journalism involved Canadian technology pioneer Steve Mann, who had developed what he called a *Wearcomp*—essentially a computer attached to a steel frame with a power converter and antennae attached. The system allowed Mann to simultaneously transmit and receive computer data, audio, and video while he walked from place to place. While wearing the apparatus one day in 1995, he spotted a major apartment building fire. Using his *WearComp*, he was able to wirelessly transmit hundreds of pictures to local newspapers while the event was still happening.

Though portable telephone devices were conceptualized in the early 20th century, the Japanese company Kyocera released the first mobile phone with a built-in camera in 1999. Around that same time, there were significant advances in wireless telephone technology, with the Japanese leading the way once again. In 2001, Tokyo became the first city to boast a commercial third generation (3G) mobile phone network. With these faster wireless connections, mobile phone users were

now able to send and receive not just pictures but video.

At this point, mobile phones were poised to become an essential tool for newsgathering and news consumption. The increased speed enabled a boom in podcasts, for example, as downloading audio programs directly to a phone solved the usability problems associated with transferring MP3 audio files via a cable to a computer. For example, WNYC, a public radio station in New York City launched the first podcast of a National Public Radio (NPR) program in 2005, and reported that the show doubled the number of listeners in just 4 weeks.

Not surprisingly, advances in mobile phone technology coincided with a more widespread occurrence of citizen journalism. Citizen journalists are essentially ordinary people who gather their own news content and then share it publicly. For example, eyewitness photos and videos captured on cell phones played a significant role in the reporting of the Southeast Asian tsunami in 2004 and in coverage of Hurricane Katrina and the London Underground bombings in 2005. Mobile phone capabilities continued to expand during this time period as well, earning the name “smartphones”—phones capable of performing many of the functions of a computer, giving users Internet access and the ability to run downloaded applications.

For professional journalists, smartphones would be a game changer. In 2007, the news agency Reuters teamed up with the Nokia mobile phone company to let a select group of journalists experiment with mobile reporting. Each reporter received a mobile journalism kit. These included a Nokia N95 smartphone, a keyboard, a tripod, and battery charger. The journalists went on to use the gear to successfully cover major news events, including the Beijing Olympics in 2008.

Also in 2007, Apple released the first iPhone. In those early years, citizen and professional journalists alike most often used their smartphone’s built-in apps, such as cameras and audio recorders, to capture news-related content. However, editing capabilities were still limited, so production techniques were typically applied to raw clips and photos later, using editing and other production software that was installed on a desktop computer.

Ultimately, it was the development of third-party applications that enabled a surge in mobile productivity and had a tremendous impact on the rapid and widespread adoption of smartphones for journalistic use.

Apps and Gear

Before journalists could be fully mobile and autonomous, they needed the ability to record, edit, and send text, videos, audio, and photos straight into a newsroom production system or to mobile news consumers via another distribution platform, such as a social network. Once developers created audio editing apps for smartphones, for example, radio reporters were able to record, edit, and mix their stories on location before sending those stories directly to air. Apple's App Store and Google's Android Market both debuted in 2008. These sites and others host tens of thousands of apps, many of them free to download, that have enabled not only traditional newsgathering practices but also innovative storytelling forms.

For example, mobile devices include a global positioning system (GPS) that makes it possible for users to get relevant information based on their locations. Location apps, such as Foursquare, take advantage of this capability, allowing users to check in once they reach a destination and then to potentially learn more about the location through the app. One of the first news organizations to experiment with this technology was the Austin American-Statesman, which partnered with a location app to create eight interactive "trips" around the city for its readers. Many news organizations have used the geolocation capabilities of their mobile apps to provide more relevant traffic and weather information for their audiences.

New apps and gear that help the user create or experience 360 visuals, virtual reality (VR) and augmented reality (AR) have sparked innovative storytelling as well. VR is a digital simulation of a three-dimensional environment that individuals can interact with in what feels like a real way. AR takes the user's view of the world and adds digital information and/or data on top of that. The digital news organization Quartz used AR to virtually bring NASA's Cassini spacecraft into people's homes, to let them "walk around it" and to learn

about its features in detail. The BBC created an AR app that lets people study various historical artifacts by viewing them, hearing about their history, and sometimes even seeing inside them with the app's X-ray function. New forms of storytelling continue to emerge and will likely be enhanced by ongoing technological advances in the mobile space.

In addition to apps, inexpensive and easy-to-use gear have changed the workflow for many multimedia and mobile journalists. As early as 2011, the Hearst-owned WGAL-TV in Lancaster, Pennsylvania, outfitted reporters with iPhones, laptops, and wireless adapters for cellular data. The expectation was that they would feed the station's online platform with information, photos, and video throughout the day while working on stories for the station's newscasts, too.

Smartphones have been especially valuable for journalists in breaking news situations as the ability to shoot, edit, and broadcast via one device reduces the amount of time needed to publish the content. To improve the quality of the content created, in addition to a host of newsgathering and production apps, mobile journalists may choose to carry a lightweight tripod, an external microphone, and an external light.

The Social Connection

The growth of mobile journalism and the expansion of social media's role in the mobile delivery of content are inextricably intertwined. In 2007, Facebook launched m.facebook.com and officially announced mobile support. By the end of that year, there were more than 50 million active users on the social platform as a whole, and the mobile version of Facebook gave those users an easy way to upload photos and to receive new messages on their phones via a short messaging service (SMS).

Twitter was originally developed in 2006 as a way to use SMS to communicate with small groups, but it quickly became a vehicle for news distribution. In June 2009, so many users were tweeting about singer Michael Jackson's death that they caused the platform's servers to crash. In 2010, Twitter released its official mobile apps for iOS and Android devices, and for the first time that year, users were able to upload and view

photos and video directly on the platform. With that new capability, citizen and professional journalists relied heavily on Twitter, along with their mobile devices, to cover uprisings from Tunisia to Yemen in what was called the Arab Spring. Without phones and social media, it would have been much more difficult for the world to follow what was happening in a part of the globe where Western media often have few reporting resources.

Soon, a majority of newsrooms were regularly monitoring Twitter for news content and the platform responded by releasing a guide for journalists on best practices for finding sources, engaging audiences, and creating effective tweets. About the same time, Facebook launched its “Journalists on Facebook” page with its own set of best practices for using the platform as a newsgathering and distribution platform.

Journalists routinely use their smartphones for informing and engaging audiences via social media platforms. They share photos and video, quotes, and other relevant information throughout the reporting day in a sort of ongoing conversation with their followers. They also regularly report live on events using nothing more than a social media platform, their phones, and a wireless or data connection.

The emergence of reporting live with a phone is closely linked to the growth of reliable wireless connections and enhanced by developments in social media. In 2006, Yankees pitcher Cory Lidle crashed his small plane into an apartment building and a Fox News Channel photojournalist used his phone to stream live video back to the control room, where it was patched through live on the air. Eventually, developers built applications, such as Periscope and Meerkat, which made it easy for anyone—journalists and other citizens—to stream live with a smartphone. The popularity of those apps prompted multiple social media companies to build out the infrastructure that would allow journalists and others to stream directly through those platforms without a third-party app.

Audience Appetite

The term *mobile journalism* also encompasses the consumption of news content on portable electronic devices. In 2019, the Pew Research Center reported that about 60% of Americans have said

they often get news via a mobile device, and one in four indicated they were using mobile apps to access news content.

Growth in mobile news consumption has been bolstered by journalism outlets creating their own news and information apps, which users download for on-demand access to the content the organization has published. In addition, “responsive web design”—essentially the practice of designing a web or mobile site that automatically adjusts to the device on which the consumer is accessing the content—has facilitated more mobile consumption of news. Responsive design, in particular, has been critical because so little news content is produced for mobile consumption only—it is nearly always first published to a news organization’s website or social platform.

Audiences also get access to news content on their mobile devices through push alerts—a message sent to a user in order to inform them of something they may want to read or view, such as breaking news. Users can decide whether they want to allow push alerts on their phones and other devices and are generally given the option to control the frequency of the messages.

Journalists’ Resistance

Though the audience seems to have fully embraced mobile consumption of news, not all journalists are fans of mobile newsgathering. Since many mobile journalists, or *mojos*, work alone, they are often required to have more skills and to be more adept at multitasking than journalists of the past. For example, it’s not unusual for a mobile reporter to be asked to take photos, capture video, and regularly update a story to social platforms while being required to meet a series of increasingly more demanding deadlines.

In addition to concerns about the workload, journalists have also expressed worries about the quality of the journalism they are able to produce under these conditions—as they are asked to do more, they have less time for fact-checking and for crafting better stories.

Issues of quality are also at the heart of some concerns about the use of citizen journalists’ mobile content in news coverage. Since most people do not have journalism training, they may

not always follow standard newsgathering practices, which help ensure ethical and principled content creation. However, the benefit of having more eyes and ears watching for news events has been leveraged by news organizations for years. CNN's iReport first launched in 2006 as a way to allow people from all around the world to contribute pictures and video of breaking news stories.

Ultimately, the growing demands of a journalist's job and a trend toward decreased staffing levels may be driving resistance to the practice of mobile newsgathering rather than concerns over the devices or delivery systems.

Emerging Mobile

Mobile journalism is nearly ubiquitous in the news ecosystem and will no doubt continue to be affected by increasing technological capabilities. Fifth-generation wireless (5G), for example, is expected to increase network speed and capacity for mobile users. The expectation is that 5G will enable faster and more reliable smartphone connectivity, which should make it easier to access increasingly elaborate multimedia content for audiences on the go.

The New York Times, for example, anticipates a day when mobile journalists automatically stream media in real-time, directly to the news consumer—from high definition (HD) photos, videos, and audio, to three-dimensional (3D) content. The media company also foresees 5G making it easier for audiences using mobile devices to enjoy more and better AR and VR experiences within stories.

Mobile storytellers are already using the technology in a wide variety of ways—from producing traditional, broadcast-style video stories to going live on Facebook to creating AR experiences. As 5G rolls out in more places around the world, fast data will become more prevalent, and as new technologies often establish new norms and a need for new products, it's more than likely that mobile journalism will continue to evolve.

MORSE CODE

The telegraph was the most revolutionary invention in the history of communication. It separated the technological boundary line between the nonelectronic and electronic modes of communication. However, the invention itself—first contemplated in 1753—would have been all but meaningless without an accompanying language. That language, also a significant innovation, is Morse code, a series of closed circuits (or dots and dashes), and open circuits (periods of silence), which corresponds to the Roman alphabet and Arabic numerals zero through nine. Morse code has been used in military and rescue operations, shipping, and public safety, and it played a critical role in the development of American journalism during the Civil War era. This entry discusses how Morse code works, its

development during the 19th century, and its impact on journalism.

Operation of Morse Code

Using a telegraph key as the transmitter device, an operator sends out messages based on short signals—the dots—combined in sequence with longer signals—the dashes. On the other end, an electromagnetic device would receive the signals, and the receiving operator would write down the transmitted letters and numbers to form a communicative text. In the 19th century, the receiving device made a click noise, which the receiving operator would transcribe into the communicative text.

In U.S. amateur radio, an operator has a “handle” that corresponds to his or her license from the Federal Communications Commission. This license name, or call letters, might be WN4CRZ. The telegraph operator, using wireless continuous wave transmission, would key the following for his or her handle: dot-dash-dash, dash-dot, dot-dot-dot-dot-dash, dash-dot-dash-dot, dot-dash-dot, and dash-dash-dot-dot. There would be a short space—silence—between each character transmitted, and slightly longer space between words. The handle, or call letters, is unique to each operator. In the example, the “N” represents the level of license (novice) and the 4 stands for the region of the United States where the operator resided (Southeast). Another operator would respond with his or her own handle, and an amateur radio interpersonal conversation would begin over the radio waves. Before radio transmission, Morse code would be transmitted with wired telegraph, which required the building of lines, usually along railroad tracks in the 19th century.

In technical terms, Morse code occurs by connecting the current when the telegraph key is pressed down, forming a circuit. Turning the key off—that is, having the points on the key separate—disengages the circuit. The current or wave that carries the dot or dash occurs when the key is struck down. The grammar of Morse code was based on the relative usage of a letter, so that “E,” the most commonly used English letter, has the shortest transmission duration, which is a single dot. Much less frequently used “Q” has a longer duration: dash-dash-dot-dash. Morse code’s

grammar was also based on long held practices in visual signal messaging, including the flag-based semaphore system—long part of military operations in Europe.

Development of Morse Code

The code is named for artist Samuel F. B. Morse, one of the North American inventors of the telegraph. Morse made his telegraphy invention along with physicist Joseph Henry and machinist Alfred Vail. With a \$30,000 internal improvements grant from Congress, Morse and Vail built a telegraph line stretching 40 miles along the railroad between Baltimore, Maryland, and Washington, DC, in 1844 after having received a patent for their telegraphic apparatus from the U.S. government. Morse and Vail would be the operators during the first official transmission of the Morse telegraphy from Washington to Baltimore on May 24, 1844. On May 1, Vail had transmitted from about halfway up the line to Baltimore back to Washington a message that the Whig Party had nominated Henry Clay for president; that transmission got to Washington 70 minutes before a train-delivered message did.

Morse’s May 24 transmitted message, 19 letters in length, to Vail was: “What hath God wrought” from the Book of Numbers 23:23 in the Bible. Morse was in the U.S. Supreme Court chambers when he sent the message, while Vail was in the Mount Clair train depot in Baltimore when he received it. The four words were suggested by Annie Ellsworth, the daughter of one of Morse’s friends. Baltimore-to-Washington transmissions continued several days later as Vail reported news from the Democratic convention. Vail later was a primary builder of early telegraph lines between American cities.

As Morse, Henry, and Vail were working on their pilot telegraphy device, Morse had begun developing a code for it in 1837. At the same time, in Great Britain, physician William F. Cooke and Charles Wheatstone developed a telegraph machine that used electromagnets to complete the circuit, and their machine would be used at first for the transmission of messages along rail lines in the Midlands. Cooke and Wheatstone built a telegraphic apparatus in 1841 that would print letters from a typeface wheel that was struck by a

hammer to form coded words that would have to be translated by an operator.

Morse's initial machine worked similarly. His device made indentations on a paper tape that was moved along by a clockwork-like device. As the currents were received over a wire, a magnet caused an armature to push a stylus onto the moving paper. This would result in an indentation in the paper or tape. When the circuit was off, the stylus retracted, leaving that portion of the tape un-indented. Morse developed his code to standardized text messages. Originally, Morse had planned a language of only numerals, and then the numerals would correspond to commonly used words. However, Vail came up with the ploy for using a code for each letter of the alphabet. Vail determined which letters were used most frequently by a form of content analysis in which he determined Roman letter frequency from articles in a newspaper in Morristown, New Jersey. The language became standardized by 1844 and became known as *American Morse Code*. The International Morse Code, which took into account different kinds of letter from those in the Roman alphabet, went online in 1851. These codes made the delivery of information across long distances a vital part of both industry and government. At one end, a transmitter would work the telegraph key, and the other end a receiver would transcribe what he or she heard as the "sounder," an electromagnetic clicker, detected the opening and closing of the circuit that corresponded to the Morse code. Both operators could switch roles instantly as both ends had a key and a sounder.

Civil War Era Use and Impact on Journalism

The development of the telegraph and Morse code had a significant impact on American journalism. During the Mexican-American War in the mid-19th century, reporters would ship their dispatches from Veracruz, Mexico, to Mobile, Alabama. From Mobile, the dispatches would be carried by an express rider on horseback to Montgomery. From there, the dispatches would travel by rail to Richmond, Va., and from there those reports would be transmitted along to New York using the telegraph. This saved days of time in the

transmission. Several New York newspapers shared the information coming from Mexico, and the rise of the New York Herald newspaper was directly related to publisher and editor James Gordon Bennett's early adoption of the telegraph as a means for moving news from the field to the newspaper office. In 1848, six New York newspapers combined their telegraphic operations to form the Associated Press, a cooperative that would share news and built nearly 100,000 miles of lines across the United States to serve nearly 2,000 newspapers by the 1920s.

The value of the telegraph and its language would become fully apparent in the United States during the Civil War. By the start of the war in 1861, lines had been laid along tens of thousands of miles of railroad tracks. Newspapers now could transmit what had transpired in a battle from one end of the country to the other. Major newspapers, particularly those from New York and Chicago, had a corps of reporters at the front, and their dispatches would be shared in newspapers all over the land as newspapers subscribed to the telegraph service. Because the cost of transmission was by the word, journalists learned to write shorter, clearer dispatches. Both the Union and Confederate armies also used telegraphy to transmit military information.

Controlling telegraphic information and effectively stifling the use of Morse code came to the fore in the Civil War. (Some governments around the world had been slow to adopt telegraphy because they feared it would stimulate political opposition.) At first, after Fort Sumter, the American telegraphic lines between Washington and Richmond, Virginia, were shuttered by the U.S. government. At the same time, U.S. soldiers in Baltimore cut the lines so that correspondents could not report on mob violence against a Massachusetts regiment as its soldiers transited through that city. In July of 1861, Winfield Scott, the commander of the Union Army, announced that he would determine what military information could be used in the telegraphic lines. Later, President Abraham Lincoln had Congress pass a bill that gave the federal government authority over the telegraphic lines, which to that point had been commercially owned. Thereafter, journalists agreed not to divulge troop strength or location, and not to guess at movements by armies in the

field. In order to work their way around the telegraphic censorship, journalists came up with codes of their own. The censorship sometimes made news reports quite lacking in detail and inaccurate, and the telegraphic lines sometimes broke down too. Due to these issues, the war news was often unreliable. Readers in the North might think that the U.S. Army had won a battle when in fact it had lost or fought to a draw.

Another major development related to the language of the telegraph was its impact on journalistic writing. Accordingly, newspapermen began to write more concise dispatches, and a new format of writing emerged, the inverted pyramid, where the most important and latest information was summarized at the top of an article. This happened about the same time as two other major 19th-century events in the United States: the rising emphasis on science as a way of knowing, including the key principle that the simplest explanation is often the best, and the development of information—that is, news—as the key journalistic commodity.

age of social media and cyber communication. Journalists have been portrayed as both dedicated crusaders in the pursuit of truth and unscrupulous manipulators of it, often in the same period. This dichotomy was evident almost from the beginning of cinema, as evidenced by such seemingly polarizing titles as *Horsewhipping an Editor* (1900) and *The Reporter's Courage* (1912). The likeable rogues and populist reporters of *The Front Page* (1931) and *It Happened One Night* (1934) were offset by the ruthless editors of *Five Star Final* and *Scandal Sheet* (both 1931). The crusading editor in *Deadline U.S.A.* (1952) had his darker counterpart in the manipulative reporter of *Ace in the Hole* (1951). The exposure of the Watergate scandal by Bob Woodward and Carl Bernstein in *All the President's Men* (1976) was contrasted by the scathing attack on broadcast news in *Network*, released the same year. Even recently, the heroic achievements of the *Boston Globe* team in the Academy Award-winning *Spotlight* (2015) were balanced by the vile depiction of the freelance cameraman in *Nightcrawler* (2014).

While the journalism film has seldom been recognized as a definable genre, perhaps in part because the journalist character can be found in films that are more widely identified as examples of other established genres, for those films that focus specifically on the practice of the profession a definite genre pattern and aspects of iconography can be determined. The motivating factor in journalism films involves issues of truth, which usually the members of the press are attempting to expose or reveal to the public, though in some cases (as in *Ace in the Hole*), it is the journalist who is concealing the truth or manipulating it for his or her own purposes. The genre formula also involves both external and internal conflicts, as the journalists must confront outside forces that are preventing them from achieving their goals, such as gangsters, corrupt politicians, and even an unreceptive public, while also undergoing debates within the news organization itself about the handling of the news. This pattern is evident even in such recent films as *The Post* (2017), *Spotlight*, and *Shock and Awe* (2017), with the journalists facing outside pressures while also debating among themselves when and how to break the story.

MOTION PICTURES, JOURNALISM IN

Much like the public at large, the film industry has had a love–hate relationship with the journalism profession, which continues even in the

The Silent Era

While many surveys of journalism films credit the 1931 film version of Ben Hecht and Charles MacArthur's 1928 stage play *The Front Page* as creating the prototype for the screen reporter, the basic components of the genre were established during the silent era. The confrontational relationship between reporters and editors that provided the main focus of *The Front Page* and is still evident in journalism films today was apparent as early as Charlie Chaplin's first screen appearance in *Making a Living* (1914), in which he plays a hustler who drives an editor to distraction while applying for a job as a reporter. Despite the absence of sound, the atmosphere of a busy bustling newsroom was generated in these early works, with films such as *The Last Edition* (1925) taking an almost documentary approach to detailing the workings of a metropolitan paper. The silent era introduced the various divisions of the profession, including war correspondents, crime reporters, sportswriters, critics, advice columnists, scandalmongering gossip writers, and newsboys. Perhaps inspired by the exploits of Nellie Bly and other female journalists, the early silent era also proved to be a significant period for women in the profession, as indicated by such titles as *A Female Reporter* (1909), *The Girl Reporter's Big Scoop* (1912), *The Girl Reporter* (1913), *Dolly's Scoop* (1916), and both Biograph and Vitagraph listing films in 1914 titled *Her Big Scoop*.

Preproduction Code Films and Depression-Era Journalists

The coming of sound coincided with the appearance on stage of *The Front Page*, the influence of which was felt even before Lewis Milestone's first film version of the Hecht and MacArthur play in 1931, as the works of other journalists-turned-playwrights were brought to the screen, including *Big News*, *Gentlemen of the Press*, and *Speakeasy* (all 1929). The *Front Page* firmly established the image of the fast-talking, wisecracking reporter whose methods were sometimes questionable but justified since the journalists were less corrupt than the forces they opposed. One significant difference the screen version made from the play was to introduce editor Walter Burns at the beginning

rather than two thirds of the way through as the play had done. This allowed for the bantering antagonism between editor and reporter that remains a staple of the genre today, though even in the early silent era—before the Motion Picture Production Code, the industry's self-regulation of “social and community values,” began to be enforced—the screen adaptation had to tone down the play's profanity-strewn dialogue. Although Lee Tracy, who had originated the part of reporter Hildy Johnson on stage, was replaced in the film by Pat O'Brien, he brought his rapid-fire delivery to reporters in other films and soon became the definitive representative of the journalist on screen.

Another result of the pre-Code and Prohibition era was the popularity of the gangster genre. These films often involved members of the press either trying to expose or becoming involved with bootleggers and mobsters and drew on real incidents, such as the murder of Chicago journalist and mob associate Jake Lingle, which was anticipated by *Roadhouse Nights* (1930) and provided the inspiration for *The Finger Points* (1931). The more permissive standards of pre-Code Hollywood also allowed for a cycle of films involving ruthless editors resorting to sensationalistic tactics and exploiting sex scandals to increase circulation, as represented by *Five Star Final* (1931), *Scandal Sheet* (1931), and *Scandal for Sale* (1932). With the growing importance of radio as a source of both news and entertainment, the fast-talking print journalist was matched by his broadcast counterpart in such films as *Okay America* and *Is My Face Red?* (both 1932). Many of these columnists or broadcasters were modeled on the distinctive style of Walter Winchell, who blurred the line between newsman and entertainer when he and bandleader Ben Bernie exploited their phony feud on screen in *Wake Up and Live* and *Love and Hisses* (both 1937). Even the newsroom of *Five Star Final* was replaced with a radio setting when the film was remade 5 years later as *Two Against the World* (1936).

With the enforcement of the Production Code beginning in 1934, the image of the cynical, sarcastic, and at times unscrupulous screen reporter was softened to a more romanticized image. Frank Capra's conception of the working reporter as a populist hero standing up to the wealthy and powerful

(including editors and publishers), which he had developed with the eager cub reporter in his last silent film *The Power of the Press* (1928) and *Platinum Blonde* (1931), found its greatest expression in Clark Gable's Peter Warne in the multi-Academy Award-winning *It Happened One Night* (1934). Working class reporters proved popular with Depression-era audiences and allowed the journalist to engage in both class and gender conflicts.

The increase in the number of women entering the workforce as a result of the Depression was reflected on screen in portrayals of strong independent female reporters who were able to compete with their male counterparts on the level of basic reporters, even if they were seldom shown in higher positions as editors and publishers (except by default as a result of inheriting a paper from a deceased husband or spouse). Although Joan Blondell, Claire Trevor, and even Bette Davis played a number of newswomen during this period, the most successful performer of such roles was Glenda Farrell, who was given her own series at Warner Brothers as aggressive reporter Torchy Blane. This golden era of female journalists ended with the reworking of *The Front Page* as a romantic comedy in *His Girl Friday* (1940), featuring Rosalind Russell as a distaff Hildy Johnson sparring with Cary Grant's editor Walter Burns.

Foreign Correspondents, Media Barons, and Journalists in Film Noir

The Second World War brought an end to The Front Page brand of insouciant and irresponsible reporters, as focus shifted to the efforts of dedicated war correspondents. A year before the United States entered the conflict Alfred Hitchcock, in his second American film *Foreign Correspondent* (1940), signaled the change as hero Johnny Jones moves from a position of indifference about the war to commitment, concluding with Jones broadcasting a plea from London as the bombs are falling for America to come to the aid of its European allies. The end of the war also brought the era's greatest presentation of a war correspondent with Burgess Meredith's portrayal of Ernie Pyle in the *Story of G. I. Joe* (1945).

If the war correspondents created a heroic impression of the profession, the movie industry's love-hate relationship with journalism continued

to reinforce the negative aspects of the news business in the form of megalomaniacal media barons. The ambiguous attitude of the public toward the press is encapsulated in the title character of Orson Welles's *Citizen Kane* (1941), who sees himself as a champion of the working man when he first takes over the *New York Inquirer* but whose actions increasingly are shown to be motivated by self-interest. Although the film contains obvious parallels to the life of media mogul William Randolph Hearst, who is even mentioned briefly early in the film, Welles and uncredited cowriter John Houseman always maintained that the character of Charles Foster Kane was drawn from a number of powerful businessmen as well as incidents from Welles's own life, though it was clear that the film hit close enough to home for Hearst to attempt to stop its release. The same year brought another negative depiction of a media baron in Capra's *Meet John Doe* (1941), which anticipated the Janet Cooke scandal by a few decades in its account of columnist Ann Mitchell (Barbara Stanwyck) creating a composite character representing the downtrodden and then having to seek out an actual person to play the part. These questionable actions ultimately are justified, however, and pale in comparison to the efforts of news organization owner D. B. Norton (Edward Arnold), who seeks to manipulate the public for his own Fascistic political purposes.

The cynicism evident in these images of news organization owners continued in the cycle of noir films, which emphasized the crime and corruption in the post-war era, and provided images of amoral journalists. The cycle reached its peak with Billy Wilder's scathing *Ace in the Hole* (1951), in which down-on-his-luck newsman Chuck Tatum (Kirk Douglas) sees a chance to regain his position as a big-time reporter when he finds a man trapped in a cave in New Mexico and realizes he can control and exploit the story for several days, despite the potential danger to his hapless subject. Wilder extends his cynicism beyond Tatum to the public at large, with a crowd gathering outside the cave that is seemingly more interested in being part of the carnival-like atmosphere than in the fate of the trapped victim. The only check to Tatum's style of journalism is provided by his cautious editor, who espouses a "belt and suspenders" approach to journalism.

Crime Commissions, Scandal Magazines, and Broadcast News

Although the balance was restored somewhat by films inspired by the investigations into organized crime by the Special Committee on Organized Crime in Interstate Commerce (the Kefauver Committee), including *The Captive City* (1952), *The Turning Point* (1952), and *The System* (1953), the decade produced more negative impressions of the press through films dealing with the scandal magazines that were having a direct impact on the film industry. That the pervasiveness of a more sensationalistic form of tabloid press extended beyond Hollywood to become a global concern is evidenced by Akira Kurosawa's *Shubun (Scandal)* (1950) and Federico Fellini's *La Dolce Vita* (1960), which established the concept of the paparazzi. Even more of a concern for Hollywood than the scandal publications was the competition from the emerging medium of television, and the potential for broadcast news to mislead and manipulate the public was evident in films dealing with both radio (*The Great Man*, 1956) and television (*A Face in the Crowd*, 1957). As the film industry came to regard the new medium as less a source of competition than of revenue, television became the domain of more traditional cinematic archetypes and formulas, including the familiar screen journalist, who all but disappeared from the large screen during the 1960s. The period produced only a few works of significance, though the decade ended with Haskell Wexler's influential *Medium Cool* (1969), which incorporated its fictional television cameraman protagonist into the actual volatile events of the 1968 Democratic National Convention in Chicago.

Political Conspiracy, Conglomerates, and the Emergence of Social Media

Actual political events would ultimately reestablish the heroic stature of the screen reporter with the film version of Bob Woodward and Carl Bernstein's account of their exposing of the Watergate scandal, *All the President's Men* (1976). The film provided the logical conclusion to a series of Watergate-era political conspiracy films involving journalists and reaffirmed the importance of a free

and vigilante press. The positive image of the profession was further enhanced by the big-budget production of *Superman* (1979) featuring the ultimate journalist hero, mild-mannered reporter Clark Kent, a character who had previously been relegated to cartoons, serials, and a television series, and the film's success preceded by several years the current cycle of superhero films.

Within a short time the pendulum shifted again, as reports of falsification or fabrication of stories by journalists Janet Cooke, Michael Daly, Christopher Jones, and others led to skepticism and mistrust of the press, an attitude reflected in films such as *Absence of Malice* (1981). The period also saw an increasing concern with the global impact of journalism, with the reemergence of the war correspondent as a major figure in *The Year of Living Dangerously* (1982), *Under Fire* (1983), *Salvador* (1986), and *The Killing Fields* (1984), though these films continued to send mixed messages about the role of the journalist internationally. More recent films such as *State of Play* (2009), *The Fifth Estate* (2013), and *Snowden* (2016) suggest that we are entering a new epoch in communication and the way in which information is disseminated and received.

The end of the 20th century and the first two decades of the 21st have seen tremendous changes in both the journalism and film industries, including the decline of print media, the emergence of blogging and social media as means of communication, and the rise of media conglomerates and consolidated ownership (a development about which *Network* had already sounded a warning in 1976). In addition, platforms and methods that offer alternatives to traditional film distribution, such as streaming services and websites allowing for public posting of nonprofessional productions, have generated debates about what can be called a *movie*, while new styles and formats like found footage films and pseudo-documentary productions are challenging notions of what can be considered a journalism film. Yet, even with the changes in technology and aesthetics, one of the results of the Donald Trump presidential administration's attacks on the press, has been the reassertion of the traditions of the journalism genre and the importance of a free press, as evidenced by *Spotlight*, *The Post*, *Shock and Awe* and other recent productions. The candlestick phones and

clattering typewriters of the past may have given way to cellphones and computer keyboards, but reporters on screen (whether big or small) still argue with their editors and news organizations continue to debate how to handle a major story. What seems clear is that the film industry's love-hate relationship and the audience's fascination with films about the workings of the fourth estate will continue, no matter what new forms media may take.

than a decade. MSNBC is now part of NBCUniversal. From its beginnings, MSNBC has been willing to change its looks and content, leading to the perception that the channel was more opinion-journalism, rather than factual-journalism. Even so, the channel managed to beat both CNN and the nascent FOX News to major events on the world stage, such as their coverage of the crash of flight TWA 800, breaking the story almost 10 minutes before the other two networks. Unlike the other two all-news channels, MSNBC chased a younger cadre of viewers who understood the interconnective nature of computer networks and foresaw the shape and content in this new computer heavy environment. It was an idea that would make sense, but was ahead of its time in the production and dissemination of news via both cable and Internet. This entry examines MSNBC's launch and eventual relaunch, programming, controversies, and future.

Launch

To make all this happen took money, and a lot of it. Microsoft put up \$200 million, while NBC repurposed channel space for the network that had been used by the "America's Talking" network, itself only 18 months old. Each entity shared in the cost of constructing a \$200 million newsroom in Redmond, Washington. Leveraging the power of Microsoft for MSNBC.com and the narrative capabilities of NBC news for the MSNBC cable channel—both launched on the same day—was a highly anticipated event for both the dot-com and cable entities.

The industry was talking about this partnership as early as 1994 and the channel went live on July 15, 1996. There had been many changes before the launch as the network took advantage of the new "network of networks" or in other words the new global Internet. From the beginning, the effort by MSNBC to lure the 25- to 54-year-old demographic was a sea change from what both CNN and FOX News were doing. The stories on MSNBC were longer and, at least initially, crafted for a younger demographic. The use of prominent on-screen graphics listed email addresses and even some phone numbers, all in the hope that the viewers would become partners with the network in reporting. Unfortunately,

MSNBC

Seen as a response to the then all-news cable channel, CNN, MSNBC went live in July of 1996 after 2 years of planning. The channel was joint venture between Microsoft and NBC that lasted for more

this gambit did not pay off for MSNBC. In a bit of unintended irony, the first slogan used by MSNBC was “It’s time to get connected” even though the network had to lay off about 20% of its staff in September 1997 due to low ratings. The first year of operation found MSNBC the number three network, with 24,000 viewing households, compared to the 30,000 viewing households of FOX News and the almost 600,000 viewing households of CNN.

Early Programming

The first show featured Jodi Applegate with reporting from Lori Stokes. Over the next couple of years the content of shows on MSNBC featured both new “techy” news and opinions and reliable hard-news type stories. On the opinion side, Ann Coulter and Laura Ingraham with a show called *The Contributors*; Brian Williams’s *The News With Brian Williams*; *The Site*, a technology show with Soledad O’Brien; Jane Pauley with *Time & Again*, and Chris Matthews, who like Rachel Maddow started their own shows on the America’s Talking Network before coming to MSNBC. Matthews’s show on the new network, *Hardball With Chris Matthews*, drew on his experiences as President Jimmy Carter’s political advisor. Keith Olbermann hosted *Sports Center*, on ESPN before making the move to MSNBC in 1997. Olbermann became frustrated during the President Bill Clinton-Monica Lewinsky scandal and how it was overshadowing other stories. He left the network in 1998 and joined FOX Sports Net. *Don Imus in the Morning* (a morning simulcast of Imus’s show on KFAN radio) was canceled by MSNBC after Imus made a racist remark about the Rutgers Scarlet Knights women’s basketball team. Imus landed on the Fox Business Network.

Contemporary Programming

The 21st century was not even 2 years old when the World Trade Center was attacked and brought down on September 11, 2001. By this time, NBC had diversified its broadcast holdings and was able to reposition CNBC and CNBC Europe as well as MSNBC to provide up-to-the-minute coverage of this terrorist attack. Much of the

reporting from the scene came from reporter Ashleigh Banfield, who had been on the scene for a different story. The same type of repositioning broadcast and online assets helped the network score 3 times the ratings as it covered the 2002 Winter Olympics, but it still was not enough to unseat CNN from its higher rankings. This came after efforts by MSNBC to pivot the network to more opinion shows, trying to follow the lead of FOX News. MSNBC watched its ratings fall about 36% from the previous year.

Another indication of the network’s desire was the hiring of high-profile talent to do their own shows, especially in the evenings. Phil Donahue was a liberal anti-war activist but his show never reached the demographics that MSNBC needed. In his first week, ratings dropped to just 136,000 households from 660,000. Keith Olbermann took Donahue’s time slot for his show, *Countdown With Keith Olbermann*. The slot vacated by Olbermann was filled with *Hardball With Chris Matthews*. While former wrestler and Governor of Minnesota, Jesse Ventura, was offered the slot to do his own show, his show lasted only a few months.

Countdown: Iraq was hosted originally by Lester Holt. It was later called *Countdown*, with the show hosted by Keith Olbermann, who had come back to MSNBC to do the show. Conservative Tucker Carlson was brought into the lineup with *The Situation With Tucker Carlson*. The show lasted 3 years as *Tucker*.

From 8:00 PM until midnight each weekday evening, MSNBC hosted anchors Chris Hayes at 8:00, Rachel Maddow at 9:00, Lawrence O’Donnell at 10:00, and Brian Williams at 11:00 (all ET). Each one of the anchors brought a different-albeit liberal progressive filter on the day’s stories to the network anchor desks. Hayes’s show, *All In With Chris Hayes*, is an Emmy Award-winning show that often features debate. *The Rachel Maddow Show* looks beyond the days’ stories to focus on legislative policies. Maddow is a Rhodes Scholar, a progressive policy wonk, and an expert in military affairs. Maddow was also an anchor at the pre-MSNBC network, America’s Talking. Her show was widely received well by viewers, eventually showing better numbers than her opposition at CNN, *Larry King Live*.

While MSNBC was running its numbers up, the competition decided to cede the later hours to MSNBC. The daily late afternoon/early evening schedule featured *The Lead With Jake Tapper* at 4:00 PM, *The Situation Room With Wolf Blitzer* at 5:00 PM, *Erin Burnett OutFront* at 7:00 PM, and *Anderson Cooper 360* at 8:00 PM.

Controversies

Like most organizations, particularly large companies, MSNBC had its share of controversy over the years. Most of the controversies centered on personnel and bias; the difference being how those controversies were handled in a company as large as NBC with many issues played out in front of the network cameras. One of the first issues played out about a year after the network went live in 1996. Bad ratings for the year forced a 20% reduction of staff. Some of the other controversies include the following:

- Phil Donahue's program *Donahue* was canceled in 2003 ostensibly for low ratings, but in a time slot when Donahue was the highest rated MSNBC program that month.
- In April 2007, the simulcast of Don Imus's radio show, *Imus in the Morning*, was canceled after Imus made racist and sexist remarks about the Rutgers' women basketball team. Imus apologized for the remarks, but the show was canceled under pressure from advertisers.
- *The Rise of the New Right*, a 2010 documentary hosted by Chris Matthews, was criticized by conservatives and the Tea Party Movement for its depiction of the Michigan Militia's survival training camp. FreedomWorks called for a boycott of advertisers on *Hardball With Chris Matthews*.
- In November 2010, both Keith Olbermann and Joe Scarborough were suspended by the company for contributing to Democrat and Republican candidates, respectively, a violation of NBC News policy.
- In April 2012, Chris Matthews interviewed former GOP Chair Michael Steele on *Hardball With Chris Matthews* and made a number of assertions he had to apologize for later. In the interview, he called Mitt Romney a *flat earther*, stated that Romney didn't believe in evolution, and compared the Republican Party to the Ku Klux Klan.
- November of 2013 found host Martin Bashir taking aim at comments made by Sarah Palin that compared the federal debt to slavery. Palin referenced a particularly horrific practice and Bashir countered that Palin could benefit from the practice herself. Bashir was suspended and resigned 2 days later.
- Democrat candidate Andrew Yang waited over a half hour for his first opportunity to speak during the November 2019 debate that was hosted by MSNBC. Yang was left off of a network-created infographic, even though he was polling sixth out of 11 candidates. The story had been the same earlier in 2019 when MSNBC left candidate Yang off its graphics, even though Yang was tied for eight place. Yang's campaign workers tallied 15 times that MSNBC had not included Yang. Yang rejected a request to appear on MSNBC unless the network publicly apologized and would have a serious discussion about Yang's campaign.

Relaunch

In July 2012, a historic partnership came to an end when Microsoft and NBC announced the end of their 16-year partnership. NBC wanted more ownership of the news programming as well as sole ownership of their digital businesses, and Microsoft wanted more control over the digital content creation. There has been brand confusion ever since the partnership was announced. It made sense at the time: Microsoft wanted the control over the website and other online presence in the era of the Internet explosion in the late 1990s. But the company was uncomfortable about the left-leaning direction that MSNBC news was taking, although politics were not a major factor in this split of companies. In effect, NBC would now be solely owned since NBC's parent, NBC Universal, through Comcast, bought Microsoft's 50% share of the conjoined entities. It was reported at the time that the cost of this buyout to Comcast was about \$300 million.

Beginning in 2015, there was an increasing reliance on a standard presentation of hard news, which MSNBC was bringing back to the cable channel, albeit in a more generic format

that was led by Brian Williams. Williams went on to host *The 11th Hour With Brian Williams* a year later. This was the first primetime show in almost four years on MSNBC. A high point for the network came in 2017 when MSNBC outperformed both CNN and FOX News in the desirable young demographic, as well as total viewers. Five years earlier Brian Stelter wrote in the November 12, 2012 edition of *The New York Times* that in President Barack Obama's first term, MSNBC went from being an "also ran" to being the "anti-Fox." This was a singular experience for MSNBC; the network normally was outviewed by CNN to the tune of a couple million viewers. Still, the elusive 25- to 54-year-old demographic proved hard to catch.

Future Directions

At the end of the 2020 programming year, FOX News held a fairly comfortable lead in the ratings war, with about 2.6 million viewers. MSNBC followed with about 1.8 million, and CNN brought up the rear with about 1 million viewers on average. The surprise for the rating period was ESPN, the sports cable channel that ranked between MSNBC and CNN, with just over 1 million viewers. This can be attributed to the steady decline in total viewership as reflected in entertainment channels, and the rise in viewership for news and sports. And while FOX may have won the total viewer race, it was ESPN that captured the lucrative 18- to 49-year-old demographic.

Clearly, news and sports programs are major conduits for informational channels, but the industry warned the major players that, with the increasingly fragmented audience, coupled by a worldwide pandemic, all set against the backdrop of a contentious election year, meant that to survive they needed to be fluid. "Cable-cutting," *a la carte* programming, and the threat of more corporate partnerships change the ground upon which all these cable giants tread. Subscription channels such as Amazon, Netflix, and Hulu are not a threat since they rely on viewers to pay up-front for their programming. FOX News, MSNBC, and CNN are all basic cable offerings, which means they need to generate enough money by selling advertising, and that may likely become harder to do.

MUCKRAKERS

Muckraker is a somewhat pejorative term for an investigative reporter: Someone who digs up dirt or rakes muck. It is associated with a period of crusading American journalism—called *muckraking*—during the first dozen years of the 20th century, although the phrase can also be used to refer to investigative reporting in general.

Origin of the Term

President Theodore Roosevelt first coined the word *muckraker* in a speech on March 17, 1906. Roosevelt was angered by a recent political exposé published by his enemy William Randolph Hearst in *Cosmopolitan* magazine. In an address to the Washington Gridiron Club, Roosevelt complained about a dangerous new breed of the journalist whose inflammatory writings were sweeping America. "The man with the Muck-rake," Roosevelt said derisively, "the man who could look no way but downward with the muck-rake in his hands" only wanted "to rake to himself the filth on the floor" and "consistently refuses to see aught that is lofty, and fixes his eyes with solemn intentness only on that which is vile and debasing." Such a journalist, the President said, "speedily becomes, not a help to society, not an incitement to good, but one of the

most potent forces of evil” (Weinberg & Weinberg, 2001, pp. 58–59).

Although Roosevelt’s use of the word *muckraker* was negative, the muckrakers themselves embraced the insult as a badge of honor. The term stuck and would thereafter be used to refer not only to the crusading journalists of Roosevelt’s time but to later investigative reporters as well. In fact, Roosevelt’s denunciation was surprising in some ways because he was personally sympathetic to the muckrakers’ reform agenda and because his political career had been helped tremendously by positive publicity from muckrakers, some of whom he befriended. But the muckrakers’ targets also included some of Roosevelt’s fellow Republican politicians whom the President tried to appease with his attack on these journalists.

Rise of Muckraking Journalism

Prior to 1900, investigative reporting in America was rare and mostly local in nature. By the beginning of the 20th century, however, muckraking became national in scope and seemed to flower everywhere in the United States almost at once. The decade between 1902 and 1912 is generally regarded as the heyday of muckraking. In general, the muckrakers targeted corporate wrongdoing, government misbehavior, and social injustice; they viewed all three as interconnected to each other and to systemic problems spawned by the U.S. industrial revolution of their time.

The muckrakers were a uniquely homegrown American phenomenon, championing optimism, personal responsibility, individualism, and the inherent goodness of man. For the most part, the muckrakers were white, middle class, and Protestant, and their writings bore an unmistakable religious influence. Earnest and righteous, they viewed their work as a moral crusade. They believed in equality of opportunity, certain that truth would prevail if given a fair chance in the marketplace of ideas. They focused on domestic, usually urban issues, tinged with a hint of American nationalism. Their solution for the many abuses they uncovered was a simple one: the Golden Rule. “Their criticisms of American society were, in their utmost reaches, very searching and radical,” historian Richard Hofstadter (1955) noted,

“but they were themselves moderate men who intended to propose no radical remedies. From the beginning, then, they were limited by the disparity between the boldness of their means and the tameness of their ends” (p. 196).

Historians have traditionally linked muckraking to the politics of the Progressive Era. “To an extraordinary degree, the work of the Progressive movement rested upon its journalism,” Hofstadter wrote, “The fundamental critical achievement of American Progressivism was the business of exposure, and journalism was the chief occupational source of its creative writers.” The “Progressive mind,” Hofstadter (1955) continued, “was characteristically a journalistic mind and . . . its characteristic contribution was that of the socially responsible reporter-reformer” (p. 186).

Supply and demand helped spur muckraking, too. “The historical pendulum swung toward muckraking as two mutually reinforcing phenomena converged,” and as one researcher observed, “the demand for information about societal ills from an alienated, literate population of consumers; and a fiercely competitive national media that sought to supply it” (Protess et al., 1991, p. 36).

In particular, the transcontinental railroad began supplying national distribution and marketing channels, which in turn created nationwide advertising and the first mass-circulation national news magazines. Technological improvements—linotype, telegraph, illustrations, and mass production—also increased the supply of this media while decreasing the price of production. *McClure’s* and other magazines became especially popular because of their unprecedented ability to reproduce arresting photographs. Total circulation climbed into the millions as these new, slick national publications became the primary delivery system for the muckrakers.

Demand for muckraking articles was also fueled by the many abuses stemming from the industrial revolution: sweatshop labor, slum tenements, and rapid urbanization, as well as increased immigration. At the same time, rising literacy rates created more readers. Journalistic exposés proved popular with consumers, and aggressive publishers began catering to the new demand for sensational scandal coverage. Moreover, political reform groups discovered that muckrakers could be valuable allies since reformers had no political

machine of their own to spread their message. Ironically, this proliferation of investigative reporting was made possible by the very industrialized capitalism that the muckrakers exposed.

Demise

The celebrated golden age of muckraking ended by the time the United States entered World War I in 1917. There were many reasons for the demise of muckraking: The reforms they brought about had curbed the worst excesses of the industrial revolution, reducing the need for such journalism. The decline of Progressive politics also hurt muckraking because the two were so closely tied together. In addition, World War I turned the public's focus abroad and increased public deference to authority at home. Many muckrakers simply grew tired of such confrontational journalism and turned to other careers. For its part, the public seemed to grow weary of the negativity of muckraking, in part, because some irresponsible reporting discredited the muckraking movement.

At the same time, some of the muckrakers' powerful targets exerted pressure on national magazines to get rid of such crusading reporting. The consolidation of corporate-owned media also eliminated some of the magazine outlets that had once published the muckrakers. This proved to be the beginning of a century-long evolution toward media monopolies. In the words of one researcher, "as technology widened the reach of communications, increasing costs of acquiring and starting media enterprises and expanding the potential profits, the news business in the twentieth-century followed some of the same tendencies toward greater consolidation that [could] be seen in other major industries, such as automobile and oil" (Hess, 1996, p. 7). The creation of such media monopolies was an ironic conclusion to an era that began with the muckrakers' exposés of similarly rapacious monopolies such as John D. Rockefeller's Standard Oil.

Historical Legacy

In the century since the muckrakers' heyday, historians have debated their political and journalistic legacy. The earliest scholarly interpretations were mostly positive, linking the muckrakers to important Progressive-era reforms: the Pure Food and

Drug Act, child labor laws, federal income taxes, the direct election of senators, and the antitrust prosecution of Standard Oil, among others. Later historians, writing in the middle of the 20th century, criticized the muckrakers for racism and viewed them as elitists who wanted to preserve the status quo and their own social position from assault by industrialization and ethnic immigrants. By century's end, historians reached a position somewhere in the middle, noting the limits of muckraking while praising its "exposure of the underside of American capitalism" (Shapiro, 1968, pp. 29–33).

Largely, the muckrakers were reformers, not radicals. Ida Tarbell, for example, focused on how Standard Oil's ruthless tactics against competitors led to higher prices for the consumer, largely ignoring the corporation's exploitation of workers or proposals to nationalize the giant company. Although some of the muckrakers became socialists—most famously, Upton Sinclair—most of them believed in reforming capitalism, which they realized had not only spawned the many injustices that they decried but also the reform journalism that made it profitable to document these abuses in the first place.

Noted American Muckrakers

Ray Stannard Baker (1870–1946)

Baker was one of the few muckrakers to write about racism against African Americans. His 1908 book *Following the Color Line* and subsequent articles made him the first prominent white journalist to expose lynching and Jim Crow segregation in mainstream nationwide publications. In addition, Baker's exposés of railroad corruption for *McClure's* magazine were credited with passage of federal laws to regulate the industry through the creation of the Interstate Commerce Commission. Baker's support for presidential candidate Woodrow Wilson in 1912 led him to join Wilson's administration as a press secretary. In 1940, Baker won the Pulitzer Prize for his writing on Wilson's presidency.

Samuel McClure (1857–1949)

Samuel McClure, better known as S. S. McClure, was the founder and publisher of the most important muckraking magazine in the United States, *McClure's Magazine*, which dominated American

publishing from 1893 to 1911. McClure hired Lincoln Steffens, Ida Tarbell, Ray Stannard Baker, and other talented journalists; paid them well; and gave them the time and resources to dig up compelling stories of wrongdoing that created a national following. He also published high-quality fiction by Willa Cather, Rudyard Kipling, Jack London, and other writers. In addition, in 1884, McClure created the McClure Syndicate, which distributed material to newspapers.

David Graham Phillips (1867–1911)

Phillips' sensationalistic exposés of Senate corruption in 1906 led to the invention of the word *muckraker* by an angry President Theodore Roosevelt, who was defending Phillips' target, Senator Chauncey Depew, like Roosevelt a Republican politician from New York. Afterward, Phillips compiled his collection of congressional exposés into a book, *The Treason of the Senate*, which was laced with purple prose. "Treason is a strong word," Phillips declared, "but not too strong, rather too weak, to characterize the situation in which the Senate is the eager, resourceful, indefatigable agent of interests as hostile to the American people as any invading army could be, and vastly more dangerous" (Serrin & Serrin, 2002, p. 106). Phillips also wrote numerous novels until a man who claimed that Phillips had libeled his family murdered him.

Jacob Riis (1849–1914)

Riis pioneered the use of photography to expose the plight of the urban poor. A Danish American immigrant, his 1889 depictions of Manhattan slums in *Scribner's Magazine* came to the attention of then-police commissioner Theodore Roosevelt, and the two men became lifelong friends. The next year, Riis published his collection of poverty photos in the book for which he would become famous, *How the Other Half Lives*. Riis was unusual for his time in viewing poverty as caused by social conditions rather than defective character. His work helped spur laws against child labor and create urban playgrounds, settlement houses, and improved public schools.

Upton Sinclair (1878–1968)

Sinclair was probably the most famous of the muckrakers. His 1906 novel, *The Jungle*, based on Sinclair's previous undercover reporting, denounced unsanitary conditions in Chicago meatpacking plants. The book became an international bestseller and with the backing of President Theodore Roosevelt helped lead to the passage of the 1906 Pure Food and Drug Act, which established federal inspections to protect the public from tainted food and unsafe patent medicines. Sinclair was invited to the White House, where the Republican President solicited his advice and, while disagreeing with the muckraker's socialist politics, admitted that "radical action" was necessary to combat "arrogant and selfish greed on the part of the capitalist." Sinclair continued writing provocative novels and turned to politics, repeatedly but unsuccessfully running for public office. In 1934, in the midst of the Great Depression, he was nearly elected governor of California on a socialist platform. By the time of his death at the age of 90, he had published nearly 100 books and won the Pulitzer Prize for his fiction.

Lincoln Steffens (1866–1936)

Steffens was the foremost muckraker of the early 20th century. The affluent son of a California businessman, he began his career as a crime reporter for the *New York Post*, where he befriended an up-and-coming police commissioner named Theodore Roosevelt. But it was at McClure's magazine that Steffens truly blossomed, uncovering municipal corruption in cities throughout America: Chicago, Philadelphia, St. Louis, Minneapolis, Pittsburgh, and New York City. "[B]ribery is no ordinary felony," he declared in his 1904 book *The Shame of the Cities*, "but treason," so widespread as "to change the form of our government from one that is representative of the people to an oligarchy, representative of special interests" (Steffens, 1957, p. 17). Two years later, his exposés of corrupt state governments were published as a book in *The Struggle for Self-Government*. In 1906, Steffens and other muckrakers founded their own short-lived muckraking periodical called *American Magazine*. But he soon despaired that reform journalism was

not enough and that more radical steps were necessary to stop the excesses of capitalism. He moved further to the left politically after covering the 1910 Mexican Revolution, which he supported. In 1921, Steffens traveled to the Soviet Union and proclaimed of the new Communist government there: "I have seen the future and it works." But he grew disillusioned with Communism as well, as recounted in his 1931 autobiography, and died 5 years later.

Ida Tarbell (1857–1944)

Tarbell was the leading female muckraker of her day whose detailed exposés of John D. Rockefeller's Standard Oil helped lead to the passage of antitrust legislation and the breakup of Rockefeller's powerful oil monopoly in 1911. Tarbell grew up in western Pennsylvania at a time when Standard Oil was first developing oil fields there; her father was one of the many early victims of Rockefeller's ruthless rise. In 1902, Tarbell began a series of 19 crusading articles in *McClure's* magazine documenting the predatory practices of Rockefeller's empire and 2 years later combined her findings into a devastating book-length indictment, *The History of Standard Oil*. So tarnished was Rockefeller by Tarbell's exposé that he hired one of the first public relations consultants in American history and began handing out dimes to schoolchildren in a largely unsuccessful effort to improve his image. Tarbell continued writing and lecturing on other subjects in subsequent decades, but she disliked being held up as a female role model and rejected women's suffrage out of the belief that early feminists belittled the role of homemakers.

MURDOCH, RUPERT

Rupert Murdoch is an Australian-born international media mogul and founder of News Corp. Best known for innovations in tabloid journalism and politicized news, Murdoch has often courted controversy by pushing the boundaries of media regulatory regimes in various countries. Murdoch spent the latter half of the 20th century growing his media empire from a single daily newspaper in Adelaide, Australia into a global multimedia conglomerate with news, publishing, and entertainment properties spanning six continents.

At the height of his power, in the early 21st century, Murdoch's media holdings reached a larger percentage of the world's population than any other media conglomerate. In 2019, Murdoch sold off the bulk of his entertainment holdings, reorienting News Corp toward publishing, news production, and aggregation. This entry first

discusses Murdoch's early years and how he built his media empire beginning in Australia before buying up media properties in the United Kingdom and the United States. It then looks at the controversy and scandal surrounding some of Murdoch's news organizations in recent years and the move to scale back his ownership of media properties.

Early Years

Born Keith Rupert Murdoch in Melbourne, Australia, he was the second of four children, and only son, of journalist Sir Keith Murdoch and philanthropist Dame Elizabeth Murdoch (née Greene). Keith Murdoch had made a name for himself covering the First World War as managing editor of a London-based cable service run by the *Sydney Sun* and *Melbourne Herald*. He gained renown for a letter he wrote to Australia's prime minister, denouncing the British military's willingness to sacrifice Australian soldiers during the Gallipoli campaign. The letter was leaked to the press in both Australia and the United Kingdom, amplified in the latter by press baron Lord Northcliffe, and earned Murdoch powerful friends in both countries. In 1921, Keith Murdoch assumed the chief editorial position at the *Melbourne Herald*, which began a decades-long campaign of newspaper and radio station acquisitions in Australia which would later serve as the inspiration and foundation for his son Rupert's own media empire.

By the time of Rupert's birth, on March 11, 1931, his family was already firmly established in Melbourne's upper middle class. He attended a nearby boarding school, Geelong Grammar, though he faced derision from his peers because his family's wealth and status were relatively newly acquired. Groomed by his father, Rupert developed an early interest in newspapers and political debate. Unlike his father, a conservative whose newspaper was known for its consistent anti-Labor stances, Rupert was initially drawn to left-wing ideas. After a brief apprenticeship at his father's *Melbourne Herald* covering police courts, and a summer job working for the *Birmingham Gazette*, in 1950 Rupert enrolled at the University of Oxford's Worcester College and moved to the United Kingdom.

While studying at Oxford, Murdoch's outspoken socialist politics and cherished possession, a bust of V.I. Lenin, earned him the nickname "Red Rupert." But Murdoch's idealism seems to have dwindled somewhat alongside his father's health during his university years. By 1953, shortly after earning his third-class degree from Oxford, Murdoch had taken a short-term subeditor position at London's *Daily Express*, where he studied the "black art of journalism" under Lord Beaverbrook, an arch conservative whose tabloid was as highly circulated as it was committed to sensation-alist and prurient reporting.

In October 1952, while Murdoch was in his final year of university, his father died after a prolonged illness. As his health deteriorated, with an eye toward his legacy, Sir Keith maneuvered assets to provide a basis upon which Rupert might continue the family business. While he oversaw the expansion of the *Herald* group into a regional media powerhouse, Sir Keith's personal holdings were relatively meager. By the time Rupert Murdoch returned to Australia, all that remained was the 75,000-circulation tabloid, the *Adelaide News*.

News Limited

Murdoch took the helm of News Limited, the parent company of the *Adelaide News*, in October 1953, and the 22-year-old soon developed a reputation for cost-cutting, micromanagement, and boundless energy. By 1956, he had managed to add a second newspaper, the money-losing *Sunday Times* in Perth, to the News Ltd. portfolio. In a strategy that would come to epitomize Murdoch's management style and journalistic values, he unceremoniously fired wide swaths of the *Sunday Times* staff, cutting labor costs and replacing editors and reporters with loyalists from Adelaide. The tabloid veered toward more sensational reporting worthy of Beaverbrook's Fleet Street, pandering with salacious stories, playing fast, and loose with the facts, employing a vulgar populist style. Newsstand sales in Perth increased apace, helping to fuel News Ltd.'s growth in the late 1950s, when it acquired newspapers primarily in the smaller cities and towns of Australia's Western and Northern states and territories.

Attuned to the latest technological developments, Murdoch was an early adopter of the

televisual medium in Australia. The country lagged behind the United States in terms of expanding access to television, with stations initially concentrated in the commercial hubs of Sydney and Melbourne. When the Australian Broadcasting Control Board announced plans to issue television licenses in Adelaide and Brisbane, in 1957, Murdoch advocated for one license per city—hoping to secure a monopoly. When the Australian Broadcasting Control Board disagreed, granting two licenses in each city, Murdoch's Southern Television Corporation secured one while his print rival, the *Advertiser*, secured the other. Eager to beat his opponent, and to fully leverage the new medium to break into the Sydney and Melbourne markets, Murdoch set off on a fact-finding mission to the United States. There he struck up a friendship with Leonard Goldenson, head of the American Broadcasting Company, to whom Murdoch sold a 6% stake in News Ltd. Upon his return, Murdoch launched his first national publication, *TV Week*, an Australian analogue to the U.S.-based *TV Guide*. By 1959, his Channel 9 television station was on the air and thriving in Adelaide. Murdoch ran the station lean, and with a chip on its shoulder.

Murdoch leveraged his growing print and television profits to stage an insurgency into the Sydney media market, which at the time was dominated by the Fairfax and Packer families. He first broke in through subterfuge, buying the suburban Cumberland Newspapers group via proxy. By 1960, he managed to convince Fairfax to sell him a down-market tabloid, the *Daily Mirror*. As in Adelaide, Murdoch leveraged his print media holdings to bolster his case for a Sydney television license. When the regulators rejected his application, he bought into a struggling station, WIN 4, located 60 miles south of Sydney in the town of Wollongong—within broadcast range of the city's south side. Murdoch leveraged his connections with the American Broadcasting Company to secure the rights to syndicate more than 2,500 hours of American-made programming in Australia. He then used *TV Week* and the *Daily Mirror* to promote the fledgling channel in Sydney. The move helped convince Sir Frank Packer to sell Murdoch a quarter ownership stake in his Television Corporation, in exchange for access to the American programming—effectively breaking the

Fairfax-Packer duopoly in Sydney and establishing News Ltd. as a significant player in the Australian media system.

Murdoch next turned his ambitions to the seat of Australian political power—making a play to usurp the highly profitable, though somewhat backwater, *Canberra Times*. When that paper was sold to Fairfax in 1964, in an effort to stymie News Ltd.'s planned expansion in the nation's capital, Murdoch launched *The Australian*, the country's first national daily newspaper. Unlike his earlier print ventures, tabloids with populist streaks, *The Australian* was a broadsheet with a stated commitment to impartial reporting in service of “the thinking men and women of Australia.” While it developed a reputation as a serious and trustworthy paper, capable of groundbreaking reporting, it struggled to turn a profit in its early years and was subsidized by the largesse of News Ltd.'s more profitable tabloid holdings. While nominally non-partisan, *The Australian* helped make Murdoch a player in Australian national politics, as it backed various politicians and causes that served his personal business interests and proclivities. As Murdoch's personal politics continued their shift rightward, the paper developed a center-right reputation as well.

Beyond Australia

While Murdoch began acquiring overseas media properties in the early 1960s, most notably in Hong Kong and New Zealand, by the end of the decade he was flush with cash and eager to expand to the United Kingdom. Initially interested in purchasing the London *Daily Mirror*, Murdoch settled for the *News of the World*. The widely circulated weekly, known for its conservative politics and for its penchant for covering sex scandals, was ripe for acquisition due to declining circulation and profits, combined with a complicated and contentious ownership structure. The latter posed a challenge, especially for an outsider like Murdoch, but also suited the underdog disposition he had cultivated in Australia. After a ruthless year-long battle for control, Murdoch took ownership in January 1969. Later that year he acquired the *Sun*, a one-million circulation daily broadsheet that Murdoch converted to a tabloid.

Under Murdoch, both the *Sun* and the *News of the World* became renowned for their sensationalism and sexism—the former with its infamous “Page 3” spreads featuring topless women. Nevertheless, his strategy met with considerable success—under Murdoch’s ownership the circulation of the *Sun* tripled by 1973. While the *Sun* initially maintained its pre-Murdoch support of the Labour Party, by the mid-1970s it joined the *News of the World* in advocating for conservative policies and politicians. By 1979, both papers backed conservative Margaret Thatcher for prime minister, and the *Sun* became a stalwart of right-wing politics in the 1980s—most notable for its over-the-top xenophobic coverage of the Falklands War, and its ruthless exposés of Labour Party politicians. Although adding the more reputable broadsheets *The Times* and *Sunday Times* of London to his holdings in 1981, a move that secured him some 30% of the UK national newspaper market, Murdoch’s initial foray into the UK made his name synonymous with low journalistic standards, reactionary politics, and ruthless business practices.

The 1970s also saw Murdoch’s first acquisitions in the United States, where his reputation often preceded him. As in the United Kingdom, Murdoch entered the U.S. media market via the path of least resistance. After considering the *Washington Star* and *Look* magazine, in 1973 Murdoch settled for the second and third most popular newspapers in San Antonio, Texas—the morning *Express* and evening *San Antonio News*. True to form, Murdoch steered both papers to pander to the lowest common denominator—pumping them full of sensationalist and trivial stories, alongside increased coverage of crime. The strategy, which had yielded exponential growth in his UK papers, produced only modest gains in San Antonio.

His other initial print buys in the United States didn’t fare much better. In 1974, he launched the *National Star* (later rebranded *Star*), a supermarket tabloid that proved an underwhelming rival to the more established *National Enquirer*. In 1976, Murdoch purchased the *New York Post*, a storied but financially weak liberal-leaning tabloid which he drove to the right, politically, but failed to make profitable. Then, following a bruising rejected bid for the London *Observer*, Murdoch engaged in a hostile takeover of the parent

company of *New York* magazine and the *Village Voice*. Murdoch’s successful bid came at a high reputational cost—the bulk of the *New York* writing staff resigned en masse, while a threat of revolt at the *Village Voice* (a lucrative source of classified advertising revenue) safeguarded the alternative weekly’s pugnacious spirit. The *Voice* would continue assailing Murdoch and the *Post* for the duration of his ownership. Murdoch further solidified his villainous reputation among the New York media establishment by breaking ranks with other newspaper owners during the newspaper strike of 1978, buying the *Post* a month of exclusive printing in the city and Murdoch the ire of his peers.

If Murdoch’s initial print acquisitions in the United States (primarily in New York, but also in Boston and Chicago) helped establish him as a ruthless international media mogul, they also demonstrated the limits of the tabloid strategy that drove News Ltd.’s growth in Australia and the United Kingdom. Whether due to latent puritanism or the Protestant work ethic, U.S. newspaper culture has tended to prioritize middlebrow taste and aspirational aesthetics while casting aspersions upon the sorts of sex-and-scandal, working-class-oriented style championed by Murdoch in his British Commonwealth holdings.

News Corporation

If Murdoch’s initial foray into U.S. newspaper tabloids failed to live up to his level of profitability in Australia and the United Kingdom, he soon found a lucrative niche in television. In 1980, Murdoch founded News Corporation, a U.S.-based (although, until 2004, Australian-incorporated) holding company for his increasingly global media portfolio. It was the beginning of a decade of maneuvering around legal obstacles to the Australian-born Murdoch’s ultimate domination of US broadcasting. The early 1980s saw News Corp. take its first step in a decades-long expansion into entertainment media that would make the company the epitome of a broader trend of global media consolidation.

After initial investments in Warner Brothers, which skirted Federal Communications Commission (FCC) regulations against cross-ownership of newspapers and television stations in metropolitan areas (Warner owned television stations in

Boston and New York, cities where Murdoch owned the *Herald* and *Post*, respectively), by 1985 Murdoch had purchased the Hollywood film studio 20th-Century Fox. Also in 1985, Murdoch made an aggressive move into the U.S. television market, buying the Metromedia TV stations that would serve as the basis for Fox Broadcasting Company.

Murdoch faced several challenges as he expanded his media empire into the U.S. broadcast sector, including FCC cross-ownership regulations, a cap on national market share for television station ownership, and a law preventing foreign citizens from owning American television stations. Murdoch resolved the latter in 1985 by becoming a U.S. citizen. As for the other FCC hurdles, Murdoch benefited from a deregulatory trend hastened by the Ronald Reagan administration in the 1980s.

Shortly before Murdoch's acquisition of Metromedia, for example, the FCC loosened television ownership restrictions, enabling one company to own a maximum of 12 stations (the previous limit was seven) so long as they did not amount to more than 25% of the national market. In addition to creating favorable regulatory conditions for aspiring media barons such as Murdoch, under Reagan-appointed Mark Fowler the FCC ended its long-standing fairness doctrine, which had mandated that broadcasters air "both sides" of matters of public controversy—a move that fostered the commercial viability of conservative talk radio by the end of the 1980s, an enabling step toward the reemergence of mass market partisan media in the United States more broadly.

The 1980s were a decade of massive global growth for News Corp. Among its many acquisitions were Hong Kong's *South China Morning Post*, the New York book publisher Harper and Row (which Murdoch merged with Collins, creating one of the largest English-language book publishers in the world), and the Melbourne *Herald*, his father's former newspaper in Australia. But perhaps Murdoch's most significant intervention that decade was building a viable "fourth network" in the United States. Launched in 1986, Fox Broadcasting would soon rival the long-established "Big Three" U.S. broadcasters (NBC,

CBS, and ABC) through producing highly rated programming and securing lucrative rights to broadcast live sporting events. Fox was also a pioneering force in television tabloid programming, such as *A Current Affair*, *COPS*, and *America's Most Wanted*. These successful experiments in infotainment reflected Murdoch's print tabloid instincts—leveraging sex, scandal, and crime to sell papers—only applied to television.

By the mid-1990s, News Corp. had survived its final serious bout with U.S. regulators. In 1995, the FCC briefly considered holding Murdoch accountable for obfuscating the ownership of News Corp to avoid foreign ownership restrictions; he was ultimately invited to apply for a "public interest waiver"—all but absolving Murdoch of his previous violations. His foothold in the United States firmer than ever, Murdoch expanded into cable television the following year—launching Fox News Channel in 1996 to rival Ted Turner's long-dominant Cable News Network. Murdoch hired former Richard Nixon communication strategist and successful television producer Roger Ailes to lead Fox News.

Under the slogan "Fair and Balanced," a nod to the defunct fairness doctrine and subtle promise to conservative audiences that the channel would counteract a predominating "liberal bias" in the U.S. news media, Ailes and Murdoch perfected the televisual version of a Beaverbrook tabloid. While not immediately profitable, the channel's right-wing populist style found its stride in the heady aftermath of the September 11, 2001 terrorist attacks—riding a wave of xenophobia and patriotism to cable news dominance. In 2007, Murdoch added a cherry on top of his U.S. news sundae—buying the esteemed *Wall Street Journal*.

Decline

Murdoch's media empire would falter in the 2010s, consumed by the exact sort of scandals it was built on covering. Fox News's coverage of the Barack Obama presidential administration achieved new lows in terms of conspiracy reporting, and its open promotion of the conservative Tea Party movement in 2009–2010 undermined its nominal fairness and balance, exacerbating ideological polarization and

helping usher in a new “post-truth” era of U.S. political life. Meanwhile, across the pond, the *News of the World*—caught hacking the phones of celebrities as early as 2006—was discovered to have hacked the phone of a murder victim. The tabloid, Murdoch’s first purchase in the United Kingdom, succumbed to public outrage and ceased publication in 2011.

By 2016, Fox News was similarly shaken to its core. While public allegations of sexual harassment against the channel’s leading anchor, Bill O’Reilly, dated back to 2004, by 2014 allegations of quid pro quo sexual harassment and assault reached Fox president Roger Ailes. The flood gates opened 2 years later, when former Fox News anchor Gretchen Carlson’s sexual harassment lawsuit against the network’s chairman convinced more than a dozen other women to step forward with claims against Ailes. With Ailes forced to resign, Murdoch assumed the Fox News chairmanship—leading the network into a new era of lapdog coverage, largely parroting the “alternative facts” of Donald J. Trump’s presidential administration.

By 2017, Murdoch seemed ready to cash out. That year he began negotiations with the Walt Disney Company to sell 21st-Century Fox’s film, cable, and satellite divisions—the bulk of Murdoch’s entertainment holdings. The deal, which closed in 2019, enriched the Murdoch clan while allowing them to retain control of Murdoch’s prized print, broadcast, and cable news properties.

MUTUAL BROADCASTING SYSTEM

The Mutual Broadcasting System was an American commercial radio network for 65 years, operating from 1934 until 1999. Strongest in rural areas, it began as a cooperative venture and provided some competition for the more established national networks.

Origins

On September 29, 1934, four AM radio stations—WXYZ in Detroit, WGN in Chicago, WOR in New York, and WLW in Cincinnati—agreed to form a cooperative program sharing radio network. WGN and WOR controlled the operation (at first dubbed the Quality Group) and contracted with AT&T for telephone lines to link Chicago and New York, with all four stations agreeing to share the costs. The Mutual Broadcasting System was incorporated in Illinois a month later. When WXYZ (which had contributed the popular western adventure program *The Lone Ranger* to begin the network) withdrew to join the NBC network, Canadian station CKLW in Windsor, Ontario (serving the Detroit market), replaced it. *The Lone Ranger* remained on Mutual until 1942.

After a year on the air, the new network carried 40 hours of sustaining (non-advertiser supported) programs and 20 hours of commercial programming per week. The first coast-to-coast Mutual broadcast came in September 1936, and by 1940, the network served 160 stations, about 20% of those then on the air, though other networks also served some. Most of Mutual's stations were in rural areas and had less power than the affiliates of the older national networks. Indeed, many held primary affiliations with CBS or NBC and only a secondary relationship with Mutual. Still, Mutual had more affiliates than any other network—a record it held into the 1980s, long after the demise of most network programming.

When Mutual won the rights to carry the 1938 and 1939 baseball World Series broadcasts, CBS and NBC would not allow their affiliate stations to contract with Mutual for the popular sportscasts. Mutual's competitive problems and complaints to the Federal Communications Commission (FCC) contributed to the latter's investigation of "chain" or network radio from 1938 to 1941. The FCC's new network rules were upheld in a landmark 1943 Supreme Court decision, helping to even the playing field for Mutual.

Mutual was the first national network to include FM stations as affiliates after World War II, by which time the network reached nearly 85 percent of the nation's homes. Yet it still operated as a cooperative, without a keystone station or headquarters in New York as the other networks featured. Most programs were produced by WOR or WGN.

Mutual News

Mutual began to carry more news as the European political crisis worsened in the late 1930s. Listeners heard correspondents via shortwave during the Munich Crisis of 1938, including London representative John Steele and Berlin correspondent Sigrid Schultz (who may have been the first woman to serve as an overseas radio news correspondent). Mutual also picked up reports from various news agency stringers including Walter Kerr of United Press.

Mutual took advantage of a cost-saving technique when, beginning in early 1938, WOR recorded English-language news broadcasts

transmitted by European shortwave stations (especially the BBC Empire Service), and Mutual rebroadcast them unedited, often juxtaposing opposing sides. This technique drew considerable praise from radio critics as a way of allowing listeners to hear all the points of view on the news of the day and enabling them to judge the propaganda for themselves without the commentary offered on CBS and NBC.

Yet Mutual also presented some very high-quality news analysts, including Raymond Gram Swing and Quincy Howe. Mutual affiliate WOL provided many of Mutual's public affairs and commentary programs, including that of conservative commentator Fulton Lewis Jr., the public affairs panel *American Forum of the Air*, and similar offerings. Mutual soon became known for controversial news commentators, including columnist Drew Pearson, Gabriel Heatter (who covered the trial and execution of the kidnapper of the Lindbergh baby in the mid-1930s), and Raymond Clapper (who replaced Swing). Pick-ups from other Mutual stations were usually confined to special events. The local affiliate was expected to feed any major event to the whole network. Mutual was the first on the air with the news of the 1941 bombing of Pearl Harbor by the Japanese, 6 minutes ahead of CBS and NBC. By 1945, Mutual's newscasts were a 24-hour operation.

By the mid-1940s, Mutual was also offering more sportscasts, including boxing matches, the World Series, the Cotton Bowl, and many other football contests. Sports continued to be a Mutual mainstay for decades. By the 1970s, Mutual had radio rights for several golf tournaments as well as tennis. By the mid-1980s, the network carried five weekday sportscasts plus nearly 40 weekend reports.

In 1978, interviewer Larry King inherited the nightly Mutual talk show slot that had been pioneered by Herb Jepko and taken over by "Long John" Nebel until his death. King was on for 90 minutes and listeners could call in for another 90. The program ran until 1994, airing in the afternoon for its final years. Jim Bohannon, who had worked for Mutual's WCFL in Chicago in the early 1980s, filled in for King on occasion. When King's show shifted to daytime, the nighttime show became Bohannon's.

Decline

Mutual ended its cooperative operation in 1952 when General Tire purchased it and operated it in New York. In the late 1950s, network ownership changed several times, often within months. On at least two occasions, a shortage of funds threatened to close network operations (it did file for bankruptcy once) and the number of employees dropped to only 50 compared to 350 at its peak in the 1940s. A scandal ensued when it turned out one short-term owner had secretly accepted money from a Caribbean nation in return for favorable comment on the air. None of the several owners had sufficient funding to move Mutual (which had about 500 affiliates in the 1950s and 1960s) into television.

Ownership changes continued as the network shifted its headquarters from New York to Washington in 1971 (the New York news bureau closed 3 years later). In 1972, Mutual began special network feeds to Black and Spanish-programmed stations with news and sportscasts. In 1977, then-owner Amway bought Mutual's first station—WCFL in Chicago—and soon thereafter bought a New York station, the network's first owned-and-operated outlets.

In 1977, Mutual signed a contract with Western Union to use its satellite facilities, the first radio network to employ satellite distribution. Aided by its satellite network, Mutual served 950 affiliates by 1979 but the number declined slowly from then on. Its Operation Newsline provided closed-circuit feeds of news and features to affiliates.

Mutual was purchased by Westwood One in 1985. In its last 15 years, Mutual largely produced newscasts, eventually from its headquarters in Crystal City, Virginia, just south of Washington, DC. Westwood closed Mutual on Sunday, April 18, 1999, and its newscasts continued under the marketing name of CNN Radio.

N

NATIONAL PUBLIC RADIO

National Public Radio (NPR) is an American non-commercial radio network that produces and distributes news and cultural programming through its member (affiliate) stations around the country. Its flagship newsmagazine programs *All Things Considered* and *Morning Edition* each reached an estimated audience of nearly 15 million listeners a week in 2018. With over 30 news bureaus in the United States and overseas, NPR has an extensive newsgathering operation that provides in-depth news and analysis, both of which have helped establish it as a dominant player in the field of journalism.

From its beginnings as an alternative to commercial radio, NPR has moved into the mainstream. Its newsmagazine programs are among the top three most listened to radio programs in the country and it draws the largest audience of any program in morning “drive time.” This entry discusses the origins and funding of NPR, the shift toward a greater focus on breaking news in the 1990s, and changes at the network since the beginning of the 21st century.

Origins

NPR originated out of a view of radio as having an educational and cultural purpose. Following the early 1967 recommendations of the Carnegie Commission, which was appointed by President Lyndon Johnson to examine the future of

educational broadcasting, Congress passed the Public Broadcasting Act in October 1967 that created the Corporation for Public Broadcasting (CPB). The Carnegie group and the new law used the term *public* to stress the role of public participation in the developing noncommercial broadcasting system. Over the next year or so, CPB would, in turn, create and oversee both NPR and the Public Broadcasting Service (PBS). Although radio did not appear in the original Carnegie recommendations, the concerted efforts of advocates of noncommercial radio helped get radio included in the act.

NPR was formed in 1970 to improve the quality of public radio by improving programming and strengthening local public radio stations known as *affiliates*. A mission statement written by William Siemering, NPR’s first head of programming operations, said that NPR would “serve the individual” and celebrate the varied nature of the human experience, thus offering an alternative to what was available on commercial radio.

The first NPR news program to air was *All Things Considered* (ATC), a 90-minute news magazine that was heard on over 80 member stations around the country at 5 p.m. (EST), May 3, 1971. This first broadcast included a lengthy report on the May Day protests against the ongoing Vietnam War by college students and veterans, a piece on a heroin-addicted nurse, and a story from the Canadian Broadcasting Corporation that combined antiwar poetry with songs and sounds of battle from World War I.

In its early days, ATC exhibited little structure and varied from day to day depending on what staff members offered to fill the time slot. When Jack Mitchell became the show's producer in 1972, he imposed a more conventional journalistic format on the program, placing a newscast at the top of each hour, with stories ordered based on their newsworthiness. He also added a cohost when he hired Susan Stamberg, who would become the voice of ATC for the next 15 years.

The 1970s were a period of dramatic growth and program development at NPR. The opening of a London bureau was a signal that the network was serious about covering international news. Because NPR had limited resources, the program emphasized analysis and interpretation over breaking news coverage. According to Jack Mitchell the reports offered a variety of perspectives from a cross-section of sources—academics, journalists, and the common man. Over the years, this was to change as the network added more reporters like Robert Zelnick, Linda Wertheimer, Cokie Roberts, and Nina Totenberg to cover the White House, Capitol Hill, and the Supreme Court, beats that were essential to a mainstream news organization.

When Frank Mankiewicz took over as CEO in 1977 his goal was to make NPR better known to both listeners and policy makers. To this end, he arranged for live coverage of debates over control of the Panama Canal in the U.S. Senate. The gavel-to-gavel coverage—over 37 days—raised the profile of NPR and became a precedent for future broadcast coverage of both Senate and House hearings. Mankiewicz also negotiated an increase in federal funding for public radio and put in place a satellite distribution system that improved the technical quality of its national programming, which made it possible for programs to be distributed from various places in the country, not just Washington, D.C.

NPR took another important step toward becoming a major player in radio with the launch of a matching morning news magazine, *Morning Edition*. The program made its debut at 5 a.m. on November 5, 1979, with Bob Edwards as its host and aimed at attracting listeners during morning “drive time” when radio audiences are at their peak. Although they had needed some convincing initially, within a week of the new program going on the air, half of NPR's 222 member stations

decided to carry the program (or portions of it). Within a year, 90% of NPR stations were airing some or all of the program and finding that their audiences were growing as a result.

Funding

From the outset, funding was a challenge for the organization. Federal funds for public broadcasting were given to CPB, which allocated these between public television and NPR. In the early years, NPR's share was between 17% and 20% of the CPB budget; under Mankiewicz, this increased to 25%, which led to an increase in staff, more programming, and more affiliate stations.

In 1982, a 25% cut in the CPB's federal fund allocation by the Reagan administration combined with a series of business ventures that required cash investments but that did not quickly yield returns, led to a debt crisis at NPR that brought the network to the verge of bankruptcy. By mid-1983, the projected budget deficit was \$9 million. NPR was saved by a series of loans from the CPB that were guaranteed by some affiliate stations—and Mankiewicz departed.

The debt crisis resulted in a change in the financial structure of public radio. Officials realized that federal funding would always be uncertain and that NPR needed to raise funds from other sources such as corporations, foundations, and directly from listeners. Under the new funding plan launched in 1985, the CPB would provide the funds earmarked for radio directly to local stations, which would in turn pay NPR for whatever of its programming that they aired.

The stations wanted NPR to unbundle its programming so that they could select programs piecemeal. This last request was not part of the new NPR business plan but was eventually incorporated into its business model. The new business plan also included a Radio Program Fund that would provide seed money and expansion money to local stations to develop promising programs. The restructuring plan helped put NPR's financial house in order so that it was able to retire its debt in 1988.

With a decreased reliance on the CPB and thus, the federal government for funds, NPR turned to listener contributions, corporate sponsorships, and foundation grants for funding. By 2020, the main source of funding was corporate sponsorships and

fees by member stations supplemented by listener contributions. Grants from the Corporation for Public Broadcasting made up 1% of its finances. Even so, the threat of this funding being taken away remains, especially under Republican administrations that find the network's coverage more liberal than neutral.

In 2002, a bequest of over \$225 million by Joan Kroc, heiress to the McDonald's fast-food fortune, gave NPR a huge boost in revenues. While \$190 million was to be placed in its endowment fund, part of the remaining money was used to expand news operations, including opening new bureaus and training investigative journalists.

This financial security also made it possible for NPR to embrace the potential of digital media, making it the biggest organization in the audio download business. In 2010, it received grants from the Knight Foundation that were used to put journalists through a digital training program. Grants from the Gates Foundation received in 2013 were used to increase its coverage of education and global health and to fund the creation of a new web and mobile platform.

Building a News Focus

In the post-debt crisis years, NPR moved away from the vision many had for it at its inception. Siemering's vision for NPR, articulated in the mission statement he wrote, was of a service that would "enhance intellectual development, expand knowledge," and in so doing make listeners "more responsive human beings and intelligent responsible citizens of their communities and the world" (Siemering, 2015). His hope was that NPR would serve audiences from varied backgrounds, religions, races, and with varying levels of education. Siemering envisioned a role for personal stories and diverse voices that drew on the audio quality of the medium. He saw the need for a radio service that enriched its listeners' lives and that did not look at its audience as a market. Unlike commercial radio stations, in its early years, NPR's *All Things Considered* did not follow a set programming clock; instead segments were of varying length and style allowing hosts to take the time they wanted to explore a topic.

During the 1990s, NPR focused on growing its overall audience, as there was a recognition that it would have to narrow its appeal to listeners

looking for news programming, if it was to develop a loyal following. Rather than try and offer a variety of content for a broad segment of the audience, NPR increasingly focused on news and began to take on mainstream commercial stations in terms of the news stories it covered. There was an increased emphasis on covering breaking news rather than relying mainly on analysis as had been its hallmark. NPR programs also gradually changed their style of reporting. In its early years, news and feature stories on NPR had been distinctive in their use of natural sound as an integral part of the story and in the way sound and words combined to create vivid radio pictures. As NPR moved to become a major player in radio news, it moved toward a more hard news approach with sound as a supplement rather than central part of the story.

With stations now helping cover NPR's costs, there was a greater need to pay attention to what stations said their audiences wanted. Stations also began focusing on increasing contributions from nongovernment sources—from their listeners and from corporations that could not advertise but could underwrite the costs of a program in return for a brief on-air mention. In the opinion of some NPR staffers, this meant providing radio programming that was bland and safe rather than innovative and cutting edge.

As the network moved toward financial stability two more programs were added—*Weekend Edition Saturday* (in 1985) hosted by Scott Simon and a year later *Weekend Edition Sunday* hosted by Susan Stamberg. In the realm of cultural programming, NPR created *Performance Today* to showcase classical music performances recorded by member stations combined with reviews, interviews, and features covering all of the arts and NPR's *Tiny Desk Concert* featuring live performances by a variety of artists. NPR also began to distribute programs produced by its affiliates. The most popular among these are *Fresh Air*, *Wait Wait Don't Tell Me*, and *On Point*. It also began coproducing programs such as *Here and Now* with stations such as WBUR.

During the Gulf War of 1990–1991, NPR sent more reporters to cover it than any other radio news organization in the world. Some saw this as a mark of NPR's stature as a broadcaster. Audiences began to expect that NPR would be there to cover breaking news whether it was happening in

China or the Middle East or New York City. When two terrorist-piloted passenger jets crashed into New York's Twin Towers on September 11, 2001, NPR expanded the hours of *Morning Edition*, *Talk of the Nation*, and *All Things Considered* to cover the crisis continuously for the next two and a half days.

Despite efforts to cut federal funding for public radio by some Republican lawmakers in the mid-1990s, NPR news programming continued to grow though half of its cultural programs were dropped in response to anticipated funding cuts. Increasingly, its news programming defined the network's identity with more news bureaus being opened at a time when commercial broadcasters were closing theirs. This commitment to news has won it a number of awards for journalistic excellence such as the Peabody Award, the George Polk award, and the Edward R. Murrow award.

A Changing Network

The first two decades of the 21st century brought further changes at NPR. Both of its long-running news programs saw a change in hosts. In 2001, *All Things Considered* initiated a slate of three hosts later moving to four—who would rotate studio assignments with more reports from different locations. Bob Edwards, host of *Morning Edition* for nearly 25 years, was replaced in 2004 by Steve Inskeep and Renee Montagne in the hope that a two-host approach might allow for better coverage of breaking news. As of 2020, *All Things Considered* and *Morning Edition* each had four hosts, with at least one host of each show broadcasting from NPR's studios in Culver City, California, known as *NPR West*.

Established in 2002, NPR West is the network's first major production center outside Washington. It allows the network to cover more stories that originate west of the Mississippi and to add more diverse sources and perspectives in its reporting. In recent years, the network has examined contemporary issues such as the impact of climate change, why medical bills are so high, and how Muslims in the United States are defining themselves through a series of episodes spread out over a few months. In 2018, it also began visual newscasts as a way to reach audiences on social media and mobile platforms.

One of the challenges facing NPR is attracting younger audiences as most of its programs skew toward older listeners. The median age for its radio audience is 53; for NPR.org it is 43. What has brought younger audiences to NPR is its podcasts, which adapt existing programming and create new content. The NPR podcasts *Up First* and *Planet Money* ranked among the top 20 podcasts in 2019. In 2018, NPR was the leading podcast publisher with 18.9 million distinct users streaming and downloading 165 million episodes each month. Another way it has been able to draw in younger listeners is by streaming on smart speakers such as Alexa or Google Home.

While NPR has undertaken initiatives to draw in more diverse audiences, these have not been sustained. *The Tavis Smiley Radio Show* first aired in 2002 as a collaboration between NPR and a consortium of African American public radio stations. With an audience including nearly 30% African American listeners, it had a more diverse audience than other NPR programs. Despite this, in 2004 host Tavis Smiley decided to end his program, saying NPR did not do enough to bring in minority listeners. In April 2007, it launched an hour-long show, *Tell Me More*, that focused primarily on issues facing African Americans and other minorities and on international stories, but the show was cancelled in 2014 as part of extensive budget cuts at the organization. By bringing in younger hosts from minority groups for its flagship shows, the network hopes to broaden the kinds of news stories that it covers.

NPR's audience profile is the envy of many commercial broadcasters. Fully 70% of the public radio audience holds a college degree, and listeners are about 3 times more likely to have a graduate degree than the average American. Some 29% hold professional jobs (compared to 10% in the general population). As it has expanded its presence across different platforms, NPR has been able to reach more listeners. In 2020, its estimated monthly audience across all platforms was 120 million.

Almost from its inception, NPR has faced criticism from both the political right and left. Conservatives who believe in the free market are philosophically opposed to federal funding for a public radio network, arguing that if there is an audience for its offerings, then NPR should be

able to find funding from private sources and its listeners.

Critics on the right have also complained of a liberal bias they argue is evidenced by the opinions expressed and the people invited on the air to express those opinions. Such criticism was heightened after long-time political analyst Juan Williams was fired in 2010, 2 days after he made unfavorable comments about Muslims on a Fox network show where he served as a political commentator. Critics saw NPR as following double standards, since other hosts such as Cokie Roberts and Nina Totenberg regularly appeared on other networks and expressed their opinions.

Critics on the left complain that NPR has not lived up to its promise and has failed to program for a diverse audience or reach out to people who are disadvantaged, instead serving only a narrow slice of the population. For many on the left, the pressure from market forces, as NPR increasingly relies on corporate funding, means that the network is not very different from its commercial counterparts. NPR programs however do cover a broader range of topics than commercial radio and better reflect the complexity of contemporary life.

NATIVE AMERICAN NEWS MEDIA

See Indigenous News Media

NATURAL DISASTERS, COVERAGE OF

Coverage of disasters regularly appears in the top 10 news stories followed by U.S. citizens. Hurricane Katrina in 2005 was No. 2 (behind the September 11, 2001 attacks) in the Pew Centre's "Public's Top Stories of the Decade 2001-2010," while the U.S. public were more interested in Hurricane Sandy in 2012 than in the presidential election campaign of that year. It is likely that media coverage of the 2019–2020 Australian bush fires and the 2019 wildfires in California was avidly followed by the public too. In popular culture, the disaster movie is still a box office staple. The drama and danger inherent in floods, earthquakes,

droughts, hurricanes, tsunamis, and wildfires produce compelling narratives that grip the public like few other topics. Natural disasters also appeal to the news media. They align almost perfectly with the news values, journalistic norms, and narratives favored by reporters. Disasters also provide the media with a clear-cut and relatively uncontested opportunity to fulfil their normative roles of informing the public, acting as a watchdog, and holding the authorities to account. This entry examines the news value of disasters, the characteristics of disaster coverage, and the role of journalists in disaster coverage.

Disasters and News Values

The scholarship of news values goes back over 40 years to when Johan Galtung and Mari Holmboe Ruge first identified the characteristics an event must display before it is reported by the news media—and natural disasters are almost a perfect fit for many of them. Journalists like discreet, self-contained events rather than long-term trends. They like dramatic events, prefer negative news, and favor people-driven rather than statistics-driven stories. Newsrooms cover events that are near them or involve people like them or their audience. This news value of “proximity” is a key concept in coverage of natural disasters, and cultural affinity plays a part too: the Western media are more likely to cover a disaster event if the casualties are Western, too. In the United States, the popularity of the disaster location with American tourists increases the event’s attractiveness as a news topic. In their update of news values for the digital era, Tony Harcup and Deirdre O’Neill note that visuals are now an important consideration, especially for dissemination on social media. And natural disasters often provide the opportunity for harrowing (destruction, suffering) or inspiring (rescues, community resilience) photos or videos.

The notion that the media attach a value to natural disasters had led researchers to question how such a value is arrived at, and to ask what other considerations come into play, apart from the news values identified by journalism sociologists. Natural disasters throw up questions of intersectionality: To what extent do issues such as race and gender play a part in decisions about

coverage? There is undoubtedly a “hierarchy of suffering,” whereby disaster victims who are ethnically and culturally similar to media audiences are more likely to attract coverage. Coverage of disasters may also be examined through a gender lens, asking to what extent women feature in coverage and whether they are portrayed as having agency to the same extent as men.

Natural disasters also throw up the kinds of narratives that are attractive to the news media. Heroes who carry out daring rescues of stranded people, or who fight back flames or floodwaters, emerge, often from footage shot by non-journalists caught up in the event. Villains also become identified as the coverage develops: Authorities who are slow to act or who did not provide sufficient warning or engage in adequate planning. The media also favor narratives involving winning and losing, and disasters offer profuse examples: firefighters winning or losing the battle to save particular areas or emergency services winning or losing the race to deliver supplies or reconnect utilities.

Disasters and Normative Roles of the Media

In a polarized and partisan media environment, and at a time when fake news, deep-fake videos, and conspiracy theories are shared online, natural disasters present the news media with a pristine and uncomplicated opportunity to perform their normative functions. These include communicating warnings (where possible), describing what occurred, informing the public about events after the event, and contributing to individual and community recovery and resilience. Previous research has found that officials and the public learn about what is happening with ongoing disasters, what to expect from future disasters, and what to learn from past disasters from the mass media. The normative role of the media may extend to covering anniversaries and commemorative events related to the original disaster, and to hold the authorities to account over continuing disaster relief efforts, and the media have been assigned even wider normative roles by some, including storytellers, entertainers, folklorists, watchdogs, and archivists. It may also fall to the media to characterize an event as a disaster in the first place, in the face of official

efforts to downplay its significance. Scholars of crisis communications concede that once the media start calling it a disaster, it is a disaster.

There is debate over the extent to which the media are successful in performing these roles. There is widespread agreement among scholars that the media perform well when it comes to warning the public about impending disasters and informing citizens about ongoing developments. However, when it comes to explaining the causes of the disaster, or what influenced responses to it, or what the disaster will mean for the communities affected, the media perform less well. The media are excellent at reporting the present; the past and future often remain unexamined.

Characteristics of Disaster Coverage

As with other topics, the media covering natural disasters rely on official sources and often relay a “command post” perspective of events. Coverage of natural disasters is short-lived compared to other events; in a study of coverage of natural disasters over a decade, the average timeframe for coverage was a year (although, if Hurricane Katrina is excluded, it was 178 days). Reporters focus on the local and (in the case of the United States) state level, rather than the federal or societal. In the early stages of a disaster, there is a shortage of information; later, there is a surfeit. As the disaster unfolds, the usual gatekeeper role of the media changes to a policy of “open gates” whereby every item relating to an event is published or broadcast. The media prefer to deal with a central spokesperson representing the official response to the disaster and appreciate regular press conferences; however, they often, rightly, have an adversarial relationship with the authorities. One study found that, during the first 2 days of coverage of Hurricane Katrina, depiction of authority figures was positive, but once the media got a handle on what was happening, these references turned more negative. Furthermore, the media may report unconfirmed disaster “myths;” an example was news coverage of widespread looting, violence, and criminal activity during Hurricane Katrina.

Considerable attention has been focused on the frames found in media coverage of natural disasters. Researchers note that journalists return to

familiar sources and frames from previous disasters. Frames found in disaster coverage differ from those found in general news coverage in that political or ideological frames are largely absent. Disasters frames share much with narratives: for instance, war/conflict, myth/hero, and Man versus Nature frames have been identified in disasters coverage. In other analyses, frames are closely linked to topics. In a study of framing in U.S. print and TV coverage of major natural disasters, the “destruction or damage” frame was most common, followed by the “disaster cost” frame, the “evacuation” frame, and the “death and injury” frame. Nearly three quarters of disaster coverage focused on destruction or damage to homes, buildings, or other structures, over half referred to the cost of this damage, and almost a half referred to transportation/evacuation issues. Just over one third of stories emphasized death or injury—a surprisingly low number, given the old newsroom adage that “if it bleeds, it leads.”

A study of the bush fires in Australia during “Black Saturday,” 2009, identified a “blame frame” which focused on the perceived culpability of environmental campaigners. The search for a culprit continued in coverage of the commission established to investigate the causes of and responses to the fires.

The literature on the media framings of natural disasters points up a problem with framing research in general: Researchers tend to invent their own frame typologies without much reference to previous scholarship. This makes comparisons difficult. Furthermore, such frames as have been identified in media coverage of disasters bear little resemblance to the frames identified in coverage of other topics and events.

The Role of Journalists in Coverage of Natural Disasters

In addition to research about how (and how well or badly) reporters carry out the normative functions, there is a considerable amount of ethnographic research into the experiences of individual journalists reporting on natural disasters. Some of this research falls into the wider category of crisis reporting (not just natural disasters) and features familiar arguments about “parachute journalism.” However, parachuting in to a disaster region

seems unavoidable, given the unexpected nature of the events.

This kind of high-adrenaline, round-the-clock reporting engenders feelings of solidarity among the “press pack.” They often share sources and equipment and even food. Reporters at disaster sites assume greater independence and autonomy from their superiors, while back at the office, it is common for reporters on leave, and administrative or commercial staff, to volunteer to assist in the effort to cover the event.

On the ground, reporters can find themselves playing multiple roles: journalist, leader, and victim. Furthermore, journalists may have to attempt to carry out their duties while at the same time falling into the category of those affected by the disaster themselves. They may also find themselves acting as medics, search and rescue workers, or community leaders. Reporting on disasters also has an impact on journalists, including emotional trauma and posttraumatic stress disorder. For example, the BBC’s Africa correspondent, Fergal Keane, stepped back from his role in January 2020, announcing that he was suffering from posttraumatic stress disorder after several decades reporting on natural disasters and war zones around the world.

They also perform the important task of “witnessing” the event on behalf of a wider audience. The act of witnessing has been conceptualized as having four discreet phases:

Stage 1—journalists speak to eyewitnesses and report what they say;

Stage 2—journalists become eye witnesses themselves and write first-person accounts;

Stage 3—photography begins to take the place of the journalist; and

Stage 4—witnessing is outsourced to the public in the smartphone age.

The idea of witnessing is bound up with the notion of “presence.” For many news organizations, it is important to be present at the scene of a disaster and to ensure branded vans, satellite dishes, backdrops, and other equipment is visible. This propensity to use natural disasters as a form of branding opportunity has led to criticism of coverage as media performance. Furthermore, the

24-hour, rolling news cycle and the tyranny of the live feed can hamper the ability of reporters to gather news. Those involved in rolling TV broadcasts are less free to travel around the affected area than their print-media colleagues. The consequent lack of newsgathering and sourcing of new information means live feeds often become “nothing more than staged live presentations of information already gathered rather than reporting on actual ongoing events.” (Wang et al., 2013, p. 503). In contrast, print journalists are free from the necessity to “perform” eyewitnessing; instead, in their writing about their own experiences and those of others, they can bear witness more fully to the event.

Case Study: Hurricane Katrina

Hurricane Katrina struck the states of Louisiana, Mississippi, and Alabama on August 29, 2005. The city of New Orleans was particularly hard hit following the breach of the city’s flood defense system. The disaster response was criticized for being slow and inadequate. Some 1,200 people died in the aftermath of the storm. The media played a central part in the rescue efforts: The authorities relied on media reports to coordinate their efforts, and journalists were instrumental in setting the priorities of officials. For instance, Fox News reporter Geraldo Rivera held a baby up to the camera and pleaded for citizens sheltering in the city’s convention center to be rescued.

The media response to the event has been extensively examined. The portrayal of Black people “looting” while white residents “looked for food” has been cited as evidence of inherent racism in the mainstream news media. The media have also been praised for its robust interrogation of official responses to the crisis (Maureen Dowd, in an op-ed column in *The New York Times* on September 3, 2005, called Federal Emergency Management Agency Michael Brown a “blithering idiot” [p. A21]), and for innovative use of online platforms to inform citizens (the NOLA.com blog of the *Times-Picayune* won a Pulitzer Prize for its coverage).

Events in New Orleans were also seen as an important juncture in the tension between the

media and the government over who controls the narrative of events. The George W. Bush administration and local officials tried to control media access and reporting, even prohibiting reporters from covering the retrieval of bodies. CNN secured an injunction to this ban, and it was subsequently reversed. In New Orleans, reporters were stranded in the flooded city along with residents; their parachutes had become boats.

Strengths and Weaknesses of Media During Disasters

Natural disasters give journalists the opportunity to do what they do best: cover a breaking news story in a dramatic and high-stakes situation. These events play to the strengths of the media, allowing them to perform their most fundamental task: finding out new information and conveying it promptly to the public. They also point up some of the failings of the media: their inability to put disaster events in wider contexts. Research has pointed up the failure of reporting to engage with the origins or causes of a disaster, to investigate the state of preparedness for the event, or to examine the implications of the disaster for the people and communities caught up in it. The media are myopically focused on the present.

This is a concern for future coverage. Climate change means that extreme weather events are more likely to occur and will be more intense and long-lasting when they do. Yet the media has been reluctant to link weather events to the increased energy in the weather system caused by climate change. This has been found in studies of coverage of multiple natural disasters, including Australian bush fires and flooding in the United Kingdom. As the science of climate change attribution becomes more advanced, it is hoped the media will more easily be able to make this connection.

Other limitations of the news media become apparent at times of natural disasters: the tendency to focus on local issues and the failure to connect these with national or international politics or policy; the propensity to indulge rumors and myths (of looting and crime, for instance) without substantiation, and the habit of moving on too soon, before the full story has been told. One thing seems certain: given the escalating

climate crisis, the media are going to have plenty of opportunities for this kind of reporting in the future.

NBC News

The National Broadcasting Company (NBC) is one of the original “Big Three” networks in the United States, together with the American Broadcasting Company (ABC) and Columbia Broadcasting System (CBS). NBC has been vital in radio, television, cable, and digital media developments. NBC News is a part of the NBCUniversal News Group, a division of NBCUniversal, which is owned by Comcast. This entry offers an overview of NBC’s radio origins and then discusses its expansion into broadcast and cable television and internet outlets, the launch of the cable network MSNBC, developments in the 21st century, and the involvement of NBC News in various scandals. The entry closes with a discussion of Comcast’s other media properties and the different facets of NBC News.

Radio Origins

NBC originated in 1926 as the first U.S. national radio network, then owned by the Radio Corporation of America (RCA). In 1927, NBC operated two networks—the Red and the Blue—each with affiliated stations. Events such as Charles Lindbergh’s 1927 transatlantic flight and the 1928 presidential race helped NBC make a journalistic impact. However, news was not an initial programming strategy. NBC broadcasted the first daily radio network newscast in 1929—*The Headline Hunter* with Floyd Gibbons—a 30-minute program. In 1930, it became *Lowell Thomas and the News*.

In the 1930s, under the direction of A. A. “Abe” Schecter, NBC grew a news operation, but most broadcasts from abroad had an educational or cultural angle; not much was breaking news. In 1941, the U.S. government ordered NBC to divest one of its radio networks; the Blue was sold to what became known as ABC.

During World War II, radio commentators became a vital information link. News programming more than doubled during the war, helping to establish network news and special programming.

Expansion Into Television

RCA set up an experimental television station in New York in 1928 that was later known as WNBC-TV. Television was developing, but a decade later, few Americans had TV sets. NBC—often referred to as the *Peacock Network*—aired one of the first U.S. television newscasts in 1940. The newscast, anchored by radio broadcaster Lowell Thomas, could only be seen in New York. In 1947, NBC began the politically focused *Meet the Press*; its first host was Martha Rountree. The program was dramatically revived under Tim Russert’s guidance, in the 1990s becoming the most watched Sunday morning talk show. Since inception, the program has had 12 moderators; Chuck Todd has anchored since 2014.

Many consider the 1948 political conventions the true starting point for television news. What became *Nightly News* was launched in 1948 as *NBC Television Newsreel*. In 1949, NBC debuted the *Camel News Caravan*, a 15-minute weeknight network news with John Cameron Swayze. In 1954, it became the first newscast broadcast in color.

NBC ventured into news documentaries in 1952 with what became known as *Victory at Sea*, using naval war film. Despite only airing until 1953, because of syndication, it became one of the most broadcasted programs in early TV history. Producer Henry Solomon remained with NBC News, creating the *Project XX* series, documentaries airing for two decades.

The early morning program *Today* debuted in 1952, thanks to Sylvester “Pat” Weaver, then NBC’s chief programmer and later president. Originally set up as a 2-hour weekday program, it

later expanded to cover weekends too. In the 2000s, it was extended to a third and fourth hour with a combination of news, interviews, and features divided into several distinct segments; in 2020 the third hour was simply called the *3rd Hour of Today* while the fourth hour was called *Today with Hoda* [Kotb] and *Jenna* [Bush Hager].

In radio, Weaver helped create *Monitor* in 1955, a nationwide weekend program containing news, music, comedy, sports, interviews, and live reports. Originating from New York, and airing for 20 years, it featured a unique sound beacon to indicate its start each week.

In 1956, Robert Kintner took over NBC's programming, expanding news coverage. Chet Huntley and David Brinkley debuted as television coanchors at the Democratic National Convention, resulting in the evening news becoming the *Huntley-Brinkley Report*. The program—with Reuven Frank as producer—had Huntley in New York and Brinkley in Washington, D.C. Audiences loved the newscast; their sign-off “Good night, Chet; Good night, David” became a catchphrase. They anchored the newscast until 1970.

In 1960, NBC produced a documentary series called *NBC White Paper*. Many episodes dealt with serious issues such as organized crime and race riots; others had a lighter tone. The series lasted until 1980, winning many Peabody and Emmy awards.

In the 1960s and 1970s, President John F. Kennedy's assassination, civil unrest, and accomplishments in outer space spurred the networks into special coverage, increasing enthusiasm for television news. Because of successful American space missions, NBC turned studio 8H into space-mission central with models and mockups, maps, and animated figures to show astronaut movement. Kintner pushed “CBS Plus 30,” meaning NBC would always offer 30 more minutes of special events coverage than CBS.

Sponsors flocked to newscasts, special coverage, and documentary programs; the news division became highly profitable. In 1963, NBC along with CBS, expanded their weekday evening newscast from 15 to 30 minutes. In 1970, the newscast aired seven nights a week.

In 1969, NBC developed its first news “magazine”—*First Tuesday*. Airing the first Tuesday every month, the program was 2 hours,

featuring hard and soft news stories, each ranging from 15 to 40 minutes. Two years later, the program became *Chronolog*.

In the 1970s, NBC underwent several changes, the most visible being Huntley's retirement. The network launched several news magazine programs; most of them failed. One success was *Weekend*; it lasted 4 years. In the 1970s, RCA tightened its purse strings; new programs had to become profitable rapidly or they were dropped. The latter was the case with *NBC News Overnight*, which debuted in 1982 and was canceled in 1983. Despite a loyal audience, it did not generate enough revenue.

The 1980s and 1990s brought deregulation, audience fragmentation, and more NBC talent changes. Brinkley left in 1981. In 1983, Tom Brokaw changed from the *Today* morning show to *NBC Nightly News*, a move embraced by the audience. However, while NBC's nightly television newscast gained popularity, radio news began losing its appeal as talk radio gained prominence.

In 1986, General Electric bought RCA, which included NBC News. Downsizing and budget cuts followed; many employees and bureaus were eliminated. NBC News used more television stories from local affiliates to help fill gaps in network coverage. On the radio side, GE began divesting radio properties. Westwood One acquired the NBC Radio Network in 1987. It licensed the name “NBC Radio Network News”—later shortened to NBC Radio News. In essence, NBC Radio was no longer a network, only a brand name.

In 1992, NBC launched *Dateline NBC*—a magazine-style program mixing investigative reports, interviews, and features, anchored by Stone Phillips and Jane Pauley. That year *Dateline* aired a story about fire hazards in General Motors pickup trucks; people later learned *Dateline* rigged the crash test. While NBC and GM settled out of court, it dealt a blow to NBC's credibility; news chief Michael Gartner resigned, and several *Dateline* producers were fired. The scandal did not stop *Dateline*; Andrew Lack and then Executive Producer Neal Shapiro revamped the show, and in 1999, it began airing five nights a week.

Lack became news division president in the early 1990s. His ability to understand journalism, ratings points, and earnings helped NBC News; Lack revamped *Nightly News* and the *Today*

Show. *Nightly News* increased its ratings as Brokaw and Producer Jeff Gralnick focused on one main story with several special segments or features; by the end of the 1990s, it was the most watched evening newscast in the United States. The *Today Show* was outfitted with a street-level studio, added a music concert series under producer Jeff Zucker, and cemented itself as the number one morning show. With its distinctive, easy going rapport, the *Today Show* became the most lucrative program in network television. Lack transformed the news division into a profit center. Critics complained he had replaced hard news with “news you can use” features.

Cable and Internet Extensions

With technology progression, electronic, and satellite newsgathering became standard. Technology also meant increased competition and a blurring of lines between print and video, cable, and broadcast. In the 1980s, the Cable News Network (CNN) and Fox appeared, with Fox News launching in the mid-1990s. While the Big Three networks were dominant players, they were competing with hundreds of channels and network audiences shrank. NBC essentially closed its news documentary production; documentaries were not attracting audiences or sponsors.

Consumer News and Business Channel (CNBC)

To attract audiences, NBC joined the cable news movement by forming two cable networks. The first was the CNBC in 1989, a joint venture with Cablevision, focusing on business news and stock market updates. It initially did not attract viewers, lost 60 million in the first 2 years, and Cablevision pulled out. However, in 1991, NBC bought the rival Financial News Network, integrating it into CNBC. CNBC broadened programming when it hired Roger Ailes as president. His mandate was to make CNBC more appealing; Ailes added non-business and personal finance-focused programs. In the late 1990s and into the 2000s, CNBC was led by Bill Bolster. Under Bolster’s tutelage, the channel thrived; he added easy-to-understand graphics and statistics and talent such as Maria Bartiromo and Jim Cramer. A dramatic stock market increase also aided

CNBC. By 2000, its daily rating briefly exceeded that of CNN.

MSNBC

In 1996, NBC and Microsoft launched MSNBC, a channel focused on news and politics. They also launched MSNBC.com, a separate venture from the cable station despite the shared name. The cable channel relied on the resources of NBC News—with heavy-hitters Brokaw and Katie Couric making appearances—but while it was massively promoted on NBC, it failed to attract viewers. The channel lacked a clear identity and began covering more fashion and entertainment. By the end of the 1990s, ratings had fallen behind those of CNN and CNBC.

In 2002, MSNBC tried to counter Fox’s prime-time programming with Phil Donahue, but *Donahue on MSNBC* was cancelled in 2003. That same year, MSNBC added *Scarborough Country* with Joe Scarborough and *Countdown With Keith Olbermann*. While they were hits, both were later cancelled. In 2008, *The Rachel Maddow Show* was added, exceeding all expectations; it became MSNBC’s biggest draw. MSNBC generally occupies the ratings bronze spot, after Fox and CNN. Microsoft divested its interest in the cable channel in 2005 and in the website in 2012.

MSNBC’s website became a bright spot in the late 1990s, offering original content and a different experience from the cable channel. Under the guidance of former print journalist Merrill Brown, it became one of the most popular internet news sites. In 2012, NBC changed the website’s URL from MSNBC.com to NBCnews.com, making it a platform for NBC News.

Into the 21st Century

Couric and Matt Lauer anchored the *Today Show* on September 11, 2001, when the terrorist attacks on New York and Washington, D.C., occurred. NBC went live—as did the other networks—for 4 days straight. It became the longest uninterrupted news event in American television history; commercials and programs were suspended.

In 2003, NBC News approached Westwood One for a radio service called *NBC News Radio*,

consisting of 1-minute news updates. Updates were written by Westwood employees but voiced by NBC talent. Westwood One also began distributing audio of *Meet the Press*, some of NBC's late-night programming, and even CNBC radio reports. Since 2016, NBC News Radio has been an audio news service distributed via iHeartMedia's network, containing reports from NBC News correspondents and presented by iHeartMedia anchors. The radio coverage includes 1-minute and 2-minute news segments, as well as features focused on politics, money, sports, and health. People can also hear these news reports on the internet.

NBC and Vivendi Universal Entertainment merged in 2004, after GE acquired 80% of Vivendi, resulting in the formation of NBCUniversal. With this acquisition and merger, GE acquired a significant media industry investment, although NBC was a small part of GE's overall revenue.

In 2004, Brian Williams replaced Brokaw on *NBC Nightly News*. Williams's coverage of the Hurricane Katrina disaster a year later was widely praised; he showed frustration over a slow federal response. NBC's disaster coverage earned a Peabody award, a George Polk award, and the DuPont-Columbia University Award.

In late 2006, NBCUniversal underwent a corporate restructuring that affected mostly off-camera employees. *Dateline NBC*, *Today*, and *NBC Nightly News* were the news programs hit the hardest. Layoffs continued for 2 years.

In 2009, Comcast announced it would purchase 51% of NBCUniversal from GE; the sale went through in 2011. In 2014, Comcast purchased the remaining GE shares for full ownership.

NBC News and Staff in Scandals

During the 2010s, NBC News was involved in several scandals. In 2012, NBC broadcasted an edited segment of a 911 call by George Zimmerman before he shot Trayvon Martin. The segment made it sound as if Zimmerman, rather than merely responding to a dispatcher, had stated that Martin was Black, supporting a view the shooting was racially motivated. NBC, while initially declining to comment, issued an apology.

In 2015, *NBC Nightly News*'s Williams was caught falsifying a story, saying he had been aboard a U.S. military helicopter hit by enemy fire

during the 2003 Iraq invasion. Williams apologized, but was removed from the newscast. He resurfaced in 2016 on MSNBC with *The 11th Hour With Brian Williams*.

Scandal rocked NBC News again in 2017. NBC assigned journalist Ronan Farrow to cover alleged sexual abuse by film producer Harvey Weinstein. Farrow's investigation was part of the media coverage of sexual abuse that was credited with starting the #MeToo movement, although NBC failed to publish it initially; Farrow took it to *The New Yorker* and won a Pulitzer. The #MeToo scandal extended to Lauer. A *Today* show anchor since 1997, Lauer was terminated in 2017 after a female colleague made a detailed complaint accusing him of inappropriate sexual behavior during the 2014 Winter Olympics. In 2019, Farrow alleged Weinstein had used his knowledge about the accusations involving Lauer to pressure NBC into dropping the initial Weinstein investigation and that NBC knew about the Lauer allegations well before firing him.

Another NBC anchor, Megyn Kelly, was controversial from the start; critics felt the former Fox News anchor was not appropriate for NBC. Her *Megyn Kelly Today*—filling the third morning hour slot—debuted in 2017. It was cancelled in 2018 after Kelly defended the use of blackface Halloween costumes, causing a massive backlash.

Comcast Media Properties

As part of NBCUniversal, NBC News is owned by Comcast, which also owns Spanish-language broadcaster Telemundo, TeleXitos, and Cozi TV, as well as multiple cable-only channels including MSNBC, CNBC, the USA Network, E!, and Syfy.

In 2017, Comcast via NBCUniversal purchased a 25% stake in Euronews, a European 24-hour news network. That year NBCUniversal also invested in Snapchat, producing shows for the social media platform, including a twice-daily NBC News show called *Stay Tuned*. Comcast expanded its European reach in 2018 by becoming the parent company of pan-European media company Sky, Europe's largest media company and pay-per-view outlet. Critics argue that because of its ownership structure, NBC's news programs, especially *Dateline NBC*, have become promotional vehicles for NBCUniversal and Comcast properties.

As of 2020, NBC News included a rapidly growing NBC News Digital Group handling sites such as NBCNews.com, tv.MSNBC.com, TODAY.com, NightlyNews.com, NBCLatino.com, and NBCPolitics.com. NBC News also included NBC News Channel, which services some 200 affiliate stations, NBC News Radio with a network of more than 750 affiliates, the educational venture NBC Learn, NBCUniversal Archives selling archival content, and in-house production company, Peacock Productions.

Wu coined the term *network neutrality*, commonly shortened to “net neutrality,” in a 2003 law review article. In the United States, net neutrality has been the subject of numerous Federal Communications Commission (FCC) policy shifts and shaped by a handful of federal judicial opinions.

The internet developed in the 1960s as a military and academic communications system designed to ensure government communications in the event of a nuclear war or other catastrophe. When the internet became widely commercial and accessible to ordinary users in the 1990s, U.S. Congress revised the Communications Act of 1934 by passing updated amendments known as *the Telecommunications Act of 1996*. These amendments set up a minimalist regulatory scheme.

As commercialization transitioned from dial-up modem service to broadband or high-speed internet technology, telecommunications and cable companies assumed control of the internet. Many modern telecommunications companies, also known as *internet service providers (ISPs)*, which primarily operate through cable lines and newer fiberoptic cables, also generate their own content or own and operate content or subscription services. This content is news, information, commentary, streaming video, music and other entertainment, and more that reaches end-user consumers.

Broadband internet access allows end-user consumers to access more “bits,” the digitized data that travel on the internet. Measured as megabits per second, broadband internet allows more data and information to travel over the internet. The more data and information traveling over the net at higher speeds facilitates streaming entertainment, online commerce, telemedicine, video conferencing, and other data-heavy content and transactions. Much of modern daily life on the internet requires high-speed access.

In the early 2000s, concerns arose that ISPs or cable companies had the technological capabilities and could develop a business-oriented or ideological incentive to discriminate against some content or speakers or favor some content or speakers over others. In fact, at least two ISPs were exposed for blocking virtual private networks.

In his 2003 article, Wu articulated concern that the companies that own the cable infrastructure could or might control or otherwise manipulate

NET NEUTRALITY

Net neutrality or open internet is the concept that internet traffic flows without regard to its origins or content. Columbia Law School professor Tim

the speed with which information travels on their cable wires. Wu posited that internet traffic should move neutrally and transmission regulation should be similar to that of pipes or telephone lines with all information and data treated the same:

A communications network like the internet can be seen as a platform for a competition among application developers. Email, the web, and streaming applications are in a battle for attention and interest of end-users. It is therefore important that the platform be neutral to ensure the competition remains meritocratic. (Wu, 2003, p. 146)

In the United States, regulation of the internet falls under the authority of the FCC. Since 1998, the FCC has adopted two separate approaches to internet regulation under the Telecommunications Act of 1996. These divergent approaches to regulation have changed with each presidential administration.

The first designation under Title I offers a “market-based light touch” or minimalist regulatory scheme by classifying the internet as an “information service.” The second designation under Title II classifies the internet as a “telecommunications service,” or a common carrier designation, similar to a public utility, which would empower the government to impose more stringent regulation in the public’s interest. Because common carriers operate with limited or no competition and perform an important public function, they are exposed to greater government regulation.

The FCC has changed its classification of the internet several times over the years, most notably:

- In 1998, the FCC first classified broadband as an over-the-phone telecommunications service;
- in 2002, the FCC classified cable broadband as interstate information service, which was ultimately upheld by Supreme Court in 2005;
- in 2015, the FCC reclassified the internet as a telecommunications service; and
- in 2017 and 2018, the FCC under Chairman Ajit Pai reclassified the internet as an information service in the Restore Internet Freedom Act. This “light touch” order restored the Title I classification.

Since the late 2000s, courts have weighed in on a number of challenges to FCC orders and standards in challenges by ISP and cable companies. Courts interpreting the FCC’s rules tend to defer to the commission’s standards, applying the Chevron doctrine under *Chevron U.S.A. Inc. v. National Resources Defense Council* (1984).

The government’s broadband policy was intended to bring broadband internet capabilities to rural or underserved communities. Deregulation, FCC Chairman Pai argued, would spur investment and innovation, and foster growth and expansion of the internet. The 2017 changes also empower the Federal Trade Commission to intervene on grounds that “throttling” internet traffic or outright blocking content could be viewed as an antitrust violation or restraint of fair competition.

How the government classifies and thereby regulates (or does not regulate) the internet has become a highly politicized public issue. On one hand, consumer and public interest groups and critics fear that without government oversight, the telecommunications companies could discriminate against information or data, throttle the internet, block content or certain speakers, or create a tiered internet whereby subscribers pay for premium or a higher-speed internet.

On the other hand, telecommunications companies and business interests are concerned that more aggressive government oversight could stifle expansion, innovation, and other technical developments. Extensive regulation could also impair expansion of broadband service to rural or underserved communities in need of strong internet access.

Following the FCC’s 2018 shift, a number of states, including California and New York, began to adopt their own standards and regulations regarding regulating network traffic.

NEW JOURNALISM

“New Journalism” refers to a literary movement in the 1960s and 1970s that tried to expand the definition of journalism by arguing that feature writers could use the same techniques to write stories about real-life events that novelists used to write about imaginary worlds. Writers, such as Tom Wolfe, Truman Capote, and Gay Talese, often credited with launching this movement, immersed themselves in their subjects, at times spending months in the field gathering facts through research, interviews, and observation. But when they sat down to write, they produced something very different from the feature stories typically published in newspapers and magazines of the time. Instead of forcing their story into a traditional formulaic structure and institutional voice, they constructed well-developed characters, sustained dialogue, vivid scenes, and strong plot lines marked with dramatic tension. They also wrote in a voice that was distinctly their own. Their writing style, and the time and money that their in-depth research and long stories required,

did not fit the needs or budgets of most newspapers, with the *New York Herald Tribune* being a notable exception. However, the editors of *Esquire*, *The New Yorker*, *New York*, and other prominent magazines sought out these writers and published their work with great commercial success. Many of these writers went on to publish their stories in anthologies or to write what became known as *nonfiction novels*, and many of these works became best sellers.

Fact and Fiction

The New Journalists expanded the definition of what types of stories counted as “journalism,” and what reporting and writing techniques journalists could legitimately use. They also associated journalism with fiction when they used phrases like “nonfiction novel” and “narrative techniques of fiction” in describing their work. In so doing, they ignited a debate over how much like a novel or short story a journalistic piece could be before it began violating journalism’s commitment to truth and facts.

Critics praised the New Journalists for writing well-crafted, complex, and compelling stories that revitalized readers’ interest in journalism and the topics covered, as well as inspiring other writers to join the profession. Other critics, however, worried that the New Journalists were tempting reporters to stray from the facts in order to write more dramatic stories; tempting them, for example, to create composite characters (melding several real people into one fictional character), compress dialogue, rearrange events, and even fabricate details. Some New Journalists freely admitted to using these techniques, arguing that they made their stories readable and publishable without sacrificing the essential truthfulness of the tale; others adamantly opposed their use, arguing that any departure from facts, however minor, discredited a story and moved it away from journalism toward fiction. John Hersey (1914–1993), a reporter famous for his 1946 nonfiction work *Hiroshima*, said in his widely quoted statement in the *Yale Review*: “There is one sacred rule of journalism. The writer must not invent. The legend on the license must read: NONE OF THIS WAS MADE UP.”

Challenging Objectivity

In engaging in this debate over what counts as truth in journalism, the New Journalists were contributing to widespread discussion over the nature of “truth” and our ability to know and represent it objectively in stories, paintings, photographs, and other representational arts. The New Journalists engaged in this larger debate by writing stories that challenged the ideology of “objectivity” and its related practices that had come to govern the profession. Some journalists and cultural critics worried that the New Journalists, by writing in a personal voice with a strong point of view and becoming immersed in their subjects, were replacing objectivity with a dangerous subjectivity that threatened to undermine the credibility of all journalism, including the heart of the profession, daily news. But the New Journalists argued that objectivity did not guarantee truth, and that objective stories could be more misleading than stories told from a clearly presented personal point of view.

The New Journalists were not alone in challenging objectivity. Similar challenges were being mounted by scientists, historians, and anthropologists who were also struggling with the philosophical and practical limitations of objectivity and experimenting with new narrative forms for their nonfiction works. Mainstream news reporters also echoed the New Journalists’ arguments as they began doubting the ability of “objective” journalism to arrive at truth—especially after objective reporting failed to convey the complex truth of events such as McCarthyism (1950s), the Vietnam War (1960s and 1970s), and the Watergate scandal (mid-1970s). By 1996, objectivity had been so crippled as a guiding principle that the Society of Professional Journalists dropped it from its ethics code, replacing it with other principles such as fairness and accuracy.

Roots of the New Journalism

The New Journalists of the 1960s were not the first reporters in the history of American journalism to advocate for a more literary approach to writing about contemporary events—nor were they the first to call themselves “new.” Journalism historian Michael Schudson argues that as early as the 1880s, two stereotypes of reporters had

emerged: the newspaper reporter who churned out facts in a formulaic account, and the “new journalist”: an educated “man of letters” who could write stories that “sparkled” and had the same literary power to draw readers in as did the best-written novels. Some journalists of the time, such as Lincoln Steffens (1866–1936), believed that this power had a moral dimension. Reporters were morally obligated to write stories that were true, well-crafted, and rhetorically persuasive because only these stories (as opposed to dry, factual reports) could lead readers to empathize with others and spur them to take action against social injustice and abuses of power. Steffens and other like-minded journalists—Ida Tarbell (1857–1944), Ray Stannard Baker (1870–1946), David Graham Phillips (1867–1911), among others—wrote investigative magazine stories that President Theodore Roosevelt (1858–1919) derisively called *muckraking* and they wrote about society’s “muck” in a literary, rhetorically persuasive way. The social and literary ambitions of these first “new journalists” had a lasting impact on journalism, providing a foundation for generations of investigative and literary reporters and editors who believed in factual, socially committed journalism that “sparkled”—including the New Journalists of the 1960s.

The Writers

Since the beginning of American commercial journalism in the 1830s, reporters with literary ambitions have been writing stories about real-life events using characters, scenes, dialogue, action, plot—all the devices that in later times became associated more with fiction than with journalism. Their work has been published in newspapers, magazines, books, and, more recently, online publications. There are too many major writers to name. That said, those wishing to learn about the New Journalism could begin by reading the work of three foundational writers: Tom Wolfe, Gay Talese, and Truman Capote. They could also expand their reading by turning to a number of anthologies that include the work of influential nonfiction writers. These writers include Joseph Mitchell (1908–1996), John McPhee (1931–), Tracy Kidder (1945–), John Hersey (1914–1993), Joan Didion (1934–),

Hunter S. Thompson (1937–2005), Michael Herr (1940–2016), Annie Dillard (1945–), Ted Conover (1958–), Richard Ben Cramer (1950–2013), Jane Kramer (1938–), Susan Orlean (1955–), Calvin Trillin (1935–), Lillian Ross (1927–2017), Norman Mailer (1923–2007), A. J. Liebling (1904–1963), Martha Gellhorn (1908–1998), and Jimmy Breslin (1930–2017). Finally, those wishing to understand how the New Journalism has influenced new generations of writers can read the journal edited by Lee Gutkind (1945–), *Creative Nonfiction*.

Tom Wolfe (1931–2018)

Journalism critics and historians identify Tom Wolfe as one of the most influential promoters of the New Journalism. Wolfe graduated from Yale University with a PhD in American Studies and then took his first newspaper job in 1956. He worked for *The Washington Post* and later for the *New York Herald Tribune* where, he says, he met writers like Jimmy Breslin, who showed him that journalism could be creative and exciting. In 1963, when a newspaper strike in New York City left Wolfe temporarily without work, he turned to his editor at *Esquire Magazine* with an idea: he wanted to fly to California to write about a custom car show and the hot-rod culture. The result was Wolfe's now-famous "Kandy-Kolored Tangerine-Flake Streamline Baby," an energetic piece marked with his personality that has become a model of what the New Journalism could achieve. The article later became the title piece of Wolfe's first book, a collection of 22 magazine and newspaper pieces, published in 1965.

In 1973, Wolfe published *The New Journalism*, in which he explicated the features of the genre. He went on to write several successful books in the style of the New Journalism. *The Right Stuff*, a story about the Mercury 7 astronauts, was adapted in 1983 for the Oscar-winning film of the same name. *Bonfire of the Vanities* was a satire of 1980s status-conscious New York, and *From Bauhaus to Our House*, a biting history of modern architecture. Wolfe is still credited with helping to establish The New Journalism as a literary movement, although he gave that credit to another writer, Gay Talese.

Gay Talese (1932–)

Talese was born in 1932 in Ocean City, New Jersey. As he writes in "Origins of a Nonfiction Writer," he grew up in his mother's dress shop, listening to the stories the white-gloved ladies who frequented the shop told about their private lives and about their friends and neighbors and watching as his mother encouraged the tales with unobtrusive questions. As he listened and watched, he learned "much that would be useful" to him years later when he began interviewing people for articles and books. Talese started working as a reporter in high school, writing more than 300 stories for the *Ocean City Sentinel Ledger*. He continued writing in college and then after graduation he headed for New York City where he found work as a copyboy for *The New York Times*. In his spare time, he wrote stories about the ordinary people and places that did not interest most reporters—and he quietly offered them to the editors of the *Times*, who were impressed with his work. In 1953, Talese, who had graduated college as an army officer, was commissioned and sent to Fort Knox. He kept in touch with the *Times* by writing stories during his military service. In 1956 when his tour of duty ended, the *Times* invited him to return to the paper, this time not as a copyboy but as a sports reporter. He continued to work for the *Times* for 10 years, developing the style that earned him a place in the history of New Journalism. Talese also wrote for *Esquire*, producing his most influential stories for that magazine. His two arguably most famous pieces, a profile of Joe DiMaggio titled "The Silent Season of a Hero" and his profile of Frank Sinatra titled "Frank Sinatra Has a Cold," were anthologized along with his other most popular *Esquire* pieces in the collection *Fame and Obscurity* (1970).

Talese also used his skills as a literary journalist to write internationally best-selling books. *The Kingdom and the Power* (1969) provided an inside look at *The New York Times*. *Honor Thy Father* (1971) detailed the rise and fall of the notorious Bonanno crime family of New York. *Thy Neighbor's Wife* (1981) examined the hidden and changing sex lives of Americans. *Unto the Sons* (1992) narrated his own family's emigration from Italy to the United States in the years before World War II.

Although Tom Wolfe gave Talese credit for developing the distinctive style and reporting

methods of the New Journalism, Talese never considered himself a New Journalist. He thought of himself as a very traditional writer who wanted to “do something that would hold up over time, something that could get old and still have the same resonance.” He also came to associate the New Journalism with journalists who are more interested in being celebrity writers than in doing the hard legwork required of good reporters—in cultivating a flashy, easy style designed to get attention rather than hold up over time. Yet Talese admired the work of Tom Wolfe and Norman Mailer, New Journalists who, he said, achieved “remarkable things” through diligent reporting. Although Talese did not call himself a New Journalist, he influenced many writers who did, and he continues to influence literary journalists writing today.

Truman Capote (1924–1984)

Unlike Wolfe and Talese, Truman Capote was not a journalist but a playwright and a novelist. However, he became a central figure in the New Journalism in 1965 when *The New Yorker* magazine serialized what Capote called his nonfiction novel, *In Cold Blood*. The novel told the story of a family of four in Holcomb, Kansas, who had been murdered in their beds. Capote spent 6 years reporting and writing the piece. As he told a reporter for *Life* magazine, he wanted to see if he could write a true story about real life events that had the dramatic power, excitement, and intricate structure of a novel. Capote, who by this time had become a celebrity among New York’s social elite, was interviewed extensively about his work. As he described what he did and how he did it to reporters from major national media, he introduced the idea of the “nonfiction novel” into popular discourse. He also triggered controversy as skeptical reporters, wary of his attempts to combine fiction and journalism, tried to discredit his claims to accuracy, and questioned his assertion that a responsible journalist could write a true story that read like a novel.

Conclusion: The New New Journalists

Today, the term *New Journalism* is most often associated with the writers of the 1960s and

1970s who stretched the boundaries of legitimate journalism by challenging the ideal of objectivity and advocating the use by journalists of narrative techniques used by fiction writers. Their ideas of “good journalism” continue to be explored and refined by new generations of reporters and editors who believe that it is possible to write creative, literary nonfiction that is factually true. In the early 1990s, the spirit of the New Journalists was reincarnated in yet another literary movement called *Creative Nonfiction*. This movement gained momentum under Lee Gutkind, who organized an annual creative nonfiction writing workshop at Goucher College in Baltimore, helped establish one of the nation’s first degree programs in creative nonfiction, founded the journal *Creative Nonfiction*, and published several anthologies. In the editorial rooms of newspapers and magazines, in professional journalism organizations, and in creative writing workshops across the country, writers and editors continue to take inspiration from the New Journalists, experimenting with forms, styles, and practices that can work for and give credence to a genre that tries to be simultaneously creative, personal, and “true.”

NEW MEDIA

“New media” is a complex, relative term. It broadly refers to new and additional environments of communication that arose from the Internet and related technologies—social media and computer-mediated communications—during the digital revolution. New media can refer to the move from analog to digital technologies, which is why some argue that a more concrete term for these new environments of communication is “digital media.” New or digital media are sometimes seen as in contrast with “old” analog media, although some argue they are an evolution of older media forms. Examples of old media are broadcast television, radio, and print media (e.g., newspapers). Examples of new, digital media are websites and social media platforms (e.g., Facebook, Twitter, Instagram, and LinkedIn), virtual and augmented reality, and streaming services for entertainment and gaming. All are new environments for communicating content and information that require digital technologies.

New media have created several disruptions to the journalistic profession. This entry explains the importance of new media in society and journalism, how journalists are using new media, and how new media have created changes in the journalism profession.

What is “New” in New Media?

When discussing new media, one must acknowledge how it is intertwined with convergence culture, a term coined by Henry Jenkins in his book *Convergence Culture: When Old and New Media Collide*, first published in 2006. The idea is that the “new” in “new media” is misleading because much of the digital revolution was an evolution of previous media, not necessarily novel media forms. For example, an online book is a book, an old medium, that has converged with modern technology. In terms of journalism, an example would be an online newspaper. The content of the newspaper is likely still the same, but it has converged with new technology so it can be read online rather than on paper, and it is easier to find or circulate via the Internet and social media.

What is “new” in new media is that the convergence of old media with modern digital technologies created *new methods* to organize social, political, and economic structures, as well as create new ways to disseminate and consume content. Further, new media refer to the technology that enabled increased globalization, moving society from an industrial age of manufacturing to an era of information.

While new media is a complex term, it encompasses the rapid and continual evolutions in media that create: new textual experiences, new ways of representing the world, and new relationships between subjects and media technologies. New media have led to a shift in media organizations’ focus away from “audiences” to “users” and from “consumers” to “producers”; the idea of a “mass audience” to multiple niche audiences, and from one-way communications to two-way communication.

With new media, people can consume content in multiple ways. For instance, one can read the digitally formatted version of a book downloaded to a tablet, consume entertaining content from Netflix on one’s laptop rather than through television, or read about a new game within a forum on Reddit. Social media have given a voice to the underrepresented, allowing us to see and understand the complexities of our world and increase global communication. The technological affordances of these platforms allow individuals to shape their consumption habits or experiences as they see fit—for example, by sampling items from the à la carte format of Netflix or YouTube. Users can choose what they wish to consume at any given time.

Further, unlike old media, audiences are no longer passive. Technological affordances allow new media users to interact with, shape, or even produce content themselves. Through social media, users can contact and communicate with a company or provide a news organization with a story, creating two-way communication. Further, due to the rapid growth of new technologies, there is a fragmentation of the mass audience. The ability to produce, publish, and disseminate material easily online has led to a proliferation of niche media organizations and websites. Rather than focusing on a mass audience, many media organizations are now focused on hyperlocal news, or specialized services or interests.

Use of New Media by Journalists

As discussed earlier, new media is a term that encompasses a range of different phenomena and involves a variety of disciplines. The term *new media* might bring to mind different things for different people. A computer science major might simply think of new media as the Internet. A doctor might think of new media as a technology that helps image and analyze the body. For journalists, several positive and negative aspects could come to mind. New media have brought notable changes to journalistic routines and created new journalistic values. They have been adopted by journalists to aid in traditional journalistic routines, mainly as information-gathering tools and a way to gain sources.

New media, particularly social networking platforms, have features that aid in traditional journalistic practices such as conveying, verifying, and displaying information. Social media platforms such as Facebook and Twitter allow journalists to transmit news content to their audiences by posting links, pictures, and videos of news stories they produce. Journalists can use the platforms to query followers by posting questions to their network. They can use the platforms to conduct story research, gaining background information on someone by checking their Facebook, Twitter, or Instagram profiles.

Social media platforms also act as another avenue to contact sources and enable journalists to monitor sources through the content posted on their social media feeds efficiently. If a journalist does not have a source's phone number, they can sometimes message the person through social media applications.

Journalists can gather information by skimming through their social network feeds, allowing them to see and read what people in their community or nationwide are discussing. Journalists can interact with their audience through online messaging and comments allowing them to learn more about their audience. The ability to link and share social media posts created by others enables journalists to be transparent about where they derived their information from.

Lastly, the unique features of digital platforms also allow journalists to create more content and transmit content at a faster rate than traditional

print and broadcast media. Journalists can now post and share content instantly rather than waiting for the latest publication to come out or for the next news program to air on TV in the designated time slot.

Changes in Journalism Due to New Media

New media have led to both positive and negative changes in the journalistic profession. As explained earlier, social media platforms have created another outlet for journalists to gather information and sources. They are also another avenue to transmit information quickly to an audience. However, media workers must now create more content and disseminate it faster due to the demands of an online audience. Journalists are now forced to multitask and generate content for "old" media as well as several online communication environments. Also, they must be more transparent about their work routines and engage more with the audience online. The move away from one-way communication to two-way communication between journalists and the audience, and the increase of avenues for content distribution, has drastically increased the workload of journalists.

The two-way communication factor of new media, particularly social media, has led to an increased emphasis on audience engagement. As audiences are turning their attention away from traditional broadcast and print media for more personal web and mobile platforms, two-way communication between an audience and a journalist has become valuable. Interacting with an audience is now an essential journalistic value as the engagement garners an audience's attention. Journalists must fight for attention as new media allow anyone to be a producer of content, creating a plethora of information and a fragmented audience.

The new value of engagement has led to new work routines for journalists. In his 2015 book *Engaged Journalism: Connecting With Digitally Empowered News Audiences*, Jake Batsell lists several ways journalists can engage with audience members through new media. These include promoting events online, where audience members can meet them face-to-face, to foster trust and show transparency. Journalists can also generate discourse and debate with followers through these new communication environments directly, by

asking their followers questions or inquiring about their feelings on an issue.

Audience Fragmentation

New media have contributed to a move away from mediatization—the idea that media shape and frame political discourse in society. The mass audience is now fragmented, there is more polarization of content, and the line between news and entertainment has blurred. The broader social institutions that media organizations once formed are disintegrating; the political process no longer needs to rely on the media to send out messages. New media environments provide government institutions with a platform that allows them to avoid interacting with the news media and still reach a large audience. Furthermore, new media have led to an abundance of information sources and communications, which, in turn, has led to niche marketing and polarization of content, in some cases with some news organizations tailoring news to liberal or conservative audiences.

Journalists often use culturally familiar themes that resonate with their audience, which can lead to the news media reinforcing the status quo. However, due to the affordances of social media, audience members now have some control over content production and dissemination. News managers have allowed journalists to share their gatekeeping role with so-called citizen journalists, either by sharing audience members' content on their media organizations' platforms or by having journalists work with members of the public to create content in a process known as *participatory journalism*. These developments challenge news organizations' authority and their control over messages and meaning-making.

New media have created several other challenges for journalists. For example, studies have found that journalists use social media mainly as a tool to find information and individuals who can serve as news sources. However, they often don't trust the information or sources they find on social media and prefer to use traditional media sources that have already been vetted. The use of new media to gather information involves new skills of verification and cannot fully substitute for traditional means of journalism.

Another issue with the adoption of new media in the newsroom is that it changes rapidly. The appropriation of modern, digital technology in journalism is an ongoing process. The affordances of technology are tried out and renegotiated often. While new media are becoming more accepted by journalists and part of their everyday workflow, the constant change can lead to burnout and point to issues with hyper-connectivity. Not only among journalists but among many social media users, there is a feeling of always being on and connected. The availability of new media allows one to send and receive messages quickly, which for some can create a sense that they must always respond promptly to maintain relationships.

NEW WORLD INFORMATION AND COMMUNICATION ORDER (NWICO)

Despite dramatic geopolitical and media changes worldwide, the New World Information and Communication Order (NWICO) continues to be a topic of interest to researchers and practitioners interested in international media. The conceptual framework of the NWICO placed journalism

practice and international news media flow at the center of the political, economic, and cultural agenda of countries in both the developed and developing world. In the early 21st century, NWICO provides useful insight for understanding of current journalism trends. This entry provides a brief history of NWICO, its importance when it emerged in the early 1980s, its main concepts and principles, and its present significance.

Although its origins can be traced back to the critical perspectives on media and communication that emerged in the early 1970s, the NWICO was the product of the 1980 MacBride Commission report, *Many Voices, One World*, commissioned by the United Nations Educational, Scientific and Cultural Organization (UNESCO) as a contribution to the debate about equity in international communication. Named after its head, Sean MacBride, former Irish foreign minister and winner of the 1974 Nobel Prize, the commission was charged with assessing international communication problems and making suggestions for their resolution in an effort to place these issues at the forefront of the international policy agenda (Thussu 2005). Proponents of NWICO identified the commission as part of an ongoing process, not as a compiler of “any given set of conditions and practices” (MacBride et al. 1980, p. xviii). The primary goals of NWICO included ensuring justice, equity, and reciprocity in information exchange. It advocated less dependency and downward diffusion of media, as well as increased self-reliance and cultural identity.

UNESCO formed a commission that began work in December 1977 focusing on issues of accuracy and balance of information, infrastructure, and functioning of news media, and rights and responsibilities of journalists and news media organizations. Its report included 82 recommendations aimed at reducing the gap between “the info-rich” and “the info-poor.” However, many around the world read the report as a forceful critique of the role of hegemonic influence of Western news media in the context of international relations and conflict resolution.

The MacBride report called for capacity building efforts in media and communication in developing countries through both infrastructure and human resource development. In addition, it also called for improvements in international news

reporting, particularly in breaking away from what was described as an excessive focus on “negative news.” Rather, the commission proposed development journalism, and the use of media technologies such as radio and TV for development and preservation of cultural identity, as important functions in the context of developing countries. The commission emphasized the effective integration of communication into development and culture throughout its report. This included language related to people’s participation in media production and elimination of barriers to diversity and choices of media products and content. The commission also called for international cooperation and partnership in the process of increased balances in information flow for reducing dependency of developing nations on media products from developed countries in the field of communication as a means to promote peace and security and to lessen political tensions.

However, the report—and NWICO more generally—quickly became highly political and controversial in a world dominated by cold war politics. Developed countries, particularly those opposed to Communism and Soviet-driven views, were skeptical of UNESCO’s role in shaping international communication in the 1980s. Western countries were supporters of the “free flow of information,” a position particularly aimed at countering the Eastern block’s tilt toward state media control (Carlsson 2003). This position was fueled by NWICO recommendations supporting the state’s role in addressing communication problems. The focus on the East-West dispute was broadened as NWICO included language bent on increasing flow of other media products South-South (in other words, from developing nation to other developing nations), and cultural and technical cooperation besides news, which were perceived as important in international relations (Carlsson 2003). Although the commission’s report received broad international support, the United States and the United Kingdom (UK) criticized it as a bold attack on freedom of the press, leading to the withdrawal of both countries from UNESCO membership in 1984 and 1985, respectively. While the UK rejoined UNESCO in 1997, U.S. separation lasted until 2003 (McPhail 2002).

Self-reliance and cultural identity emerged as key principles among the MacBride Commission’s

recommendations, which many nonaligned states incorporated into their planning. The commission also introduced such language as “local level and horizontal communication into thinking about development” (Carlsson 2003). Such recommendations led UNESCO to launch an International Program for the Development of Communication to assist developing or poor countries in building media infrastructure, developing communication capacities for more balanced flow of information, and promoting regional cooperation among developing countries through media programming.

NWICO sought to integrate people’s participation in the process of societal development. However, globalization of media systems spurred by deregulation and commercialization in an increasing international economy ultimately sealed the fate of NWICO as a viable issue. Implementation of NWICO’s recommendations in the late 1980s was a difficult task for most countries due to a lack of financial and human resources and a rapidly changing political, financial, and social environment, turning NWICO into an interesting process in the history of international communications with limited, if any, impact in the view of most researchers and academics.

The commission argued that negative news of disaster and political and ethnic conflict was affecting international perceptions about both developing and developed countries. Readers from Third World countries, for example, saw the “western coverage of their countries as disproportionate and distorted” (Chaudhary 2001, p. 241). Similarly, such media coverage in Western countries also prompted the media in Third World countries to “overemphasize the negative issues about western countries” (p. 242). But after the commission came forward with recommendations emphasizing a need for professional standards and integrity in news media, both Western and Third World media became more cautious in news reporting, as is evidenced in recent studies.

In analyzing the continuing debates around NWICO, Thussu explains that “despite many advances in democratization of the media, some of the key criticisms in the report are as valid in 2005 as they were in 1980” due to the impact of globalization as epitomized by media mogul Rupert Murdoch (1937–) (Thussu 2005, p. 47). Continuing imbalances in international news

media flow, and the trend toward globalization and privatization of the media, accelerated by media conglomeration and concentration, has undermined public communication in a global media culture. Media networks in the developing world emerged early in the 21st century (i.e., Tele Sur in Latin America; Al Jazeera in the Arab world) with the objective of countering dominant Western international news media (CNN, BBC, international news agencies). They sought an alternative perspective to international current affairs, international news flows remain largely dominated by large media corporations based in the developed world. In other words, the players have changed from countries to transnational media corporations but the issues remain the same.

Access to communication technology in developing countries is not much better owing to a huge technology gap between developed and developing countries. The United Nations Conference on Trade and Development (UNCTAD) report on the “Digital Divide” (defined as the gap between those with access to digital communication and technologies and those without access to them) supports such an assertion with the following:

a person in a high-income country is over 22 times more likely to be an Internet user than someone in a low-income country. Secure Internet servers, a rough indicator of electronic commerce, are over 100 times more common in high income than low-income countries. In high-income countries, mobile phones are 29 times more prevalent and mainline penetration is 21 times that of low-income countries. (UNCTAD 2006, p. iii)

Historically, low income, limited infrastructure, insufficient and untrained personnel due to a continuing brain drain from poor to wealthy countries, and weak competitive and regulatory environments have slowed the adoption of newer technologies in poor developing countries. However, adoption of satellite and broadband communication systems in some developing nations in Southeast Asia, South Asia, and Africa has helped them further cultivate diversified and innovative approaches for socio-economic development.

While for many journalism scholars the NWICO debate has turned into a relic primarily studied as a historical issue, international media developments such as the increasing concentration of media ownership and the predominance of few news media sources on the global media landscape are similar to those studied by the MacBride Commission, albeit in a changed political and economic context. Perhaps, it is time to reassess the recommendations of the MacBride report as part of a renewed discussion on international media and communication issues.

NEW YORK TIMES, THE

The New York Times is a leading U.S. newspaper with a worldwide readership publishing digital and print editions. It is widely regarded as a *newspaper of record*, meaning the paper creates a historical record of key events by providing accurate, professional journalism with rigorous editorial oversight. The newspaper’s famous motto “All the news that’s fit to print” was first created by Adolf S. Ochs in 1896 and is still featured on its print edition.

The *Times* holds the record for the most Pulitzer Prizes awarded, 127 total, claiming 16% of all 2007–2016 awards. The paper was famously nicknamed the “Grey Lady” for its heavy text orientation and resistance to color printing. However, in 1997, long after other major newspapers featured color, the *Times* published its first front page color photo alongside other significant changes, including separate sports and entertainment sections. The *Times* published its first digital edition in 1996. This entry discusses the *Times*’s history, business model, staff diversity, and its role in U.S. Supreme Court decisions on press freedom. It then looks at some of the controversies involving the *Times*’s coverage and staff in recent years and closes by discussing the paper’s coverage of the COVID-19 pandemic and the impact of the pandemic on the *Times*.

The Ochs-Sulzberger family has controlled the paper since 1896, initially through family ownership and, once the paper went public in 1967, through a controlling interest in the ownership group of The New York Times Company. In 2017,

Arthur Gregg Sulzberger was appointed *Times* publisher, following his father and grandfather. Critics charge that the Ochs-Sulzberger family dynasty promotes nepotism and restricts innovation.

The *Times*, like other mainstream newspapers, was historically supported by advertising and print subscriptions. The rise in popularity of web-based news spelled disaster for many newspapers, which lost critical classified advertising revenue to free sites, such as Craigslist, and lost corporate and political advertising revenue to news aggregator sites, like Google News and Facebook. In response to these challenges, the *Times* pioneered a new business model in 2011, transitioning from the traditional advertising-supported model to a paywall model, requiring paid subscriptions for access to digital-only content, including news, cooking, and crossword apps. In contrast to declining circulation figures for most major U.S. daily newspapers, the *Times* reports a continued increase in digital subscriptions with a stated goal of reaching 10 million total subscriptions by the year 2025. A 2017 study commissioned by *Times* Executive Editor Dean Baquet made several recommendations, including streamlining operations by cutting editing positions, adopting a more visual format, employing a more diverse staff, and promoting greater audience engagement and loyalty. The same report also outlined a project to devote more resources to covering then-President Donald J. Trump, whose 2016 election coincided with a spike in *Times* subscriptions.

History

The New York Times was founded by 31-year-old Henry Jarvis Raymond, speaker of the New York State Assembly, and George Jones, a banker. Raymond had previously worked for other New York papers, including Horace Greeley's *Tribune*, and met Jones while working at the *Tribune*. The first issue of the *Times* was published on September 18, 1851.

When Raymond died in 1869, Jones gained editorial control and financial oversight of the paper. He served as editor until his death in 1891. In 1871, the *Times* began printing the misdeeds of William Marcy "Boss" Tweed, the head of the Tammany Hall political patronage system. The

coverage is credited with bringing public attention to the Tweed Ring as well as to the newspaper. In 1884, the paper endorsed Democratic presidential candidate Grover Cleveland, breaking with its reputation as a Republican newspaper. The paper also provided significant coverage of the Civil War and Reconstruction. When Jones died in 1891, control of the *Times* passed to his heirs, who sold the paper to a group of investors known as *The New York Times Publishing Company*, led by Charles Ransom Miller.

In 1896, 38-year-old Adolph S. Ochs, the successful newspaper publisher of the *Chattanooga Times*, bought the then-failing *New York Times*. It has remained under the control of the Ochs-Sulzberger family since. The *Times* became a public company in 1967, though the family retained ownership of Class B stocks holding controlling voting rights. In March 2008, the *Times* gave two hedge funds a seat on the board, the first time the *Times* has accepted directors nominated by outsiders.

When Adolph Ochs revived *The New York Times* starting in 1896, the paper began to value fact over entertainment, a dominant news value in the 1890s. It also became the elite paper of New York, attracting a wealthy, upper-class audience, and soon developed the standard for modern mass circulation newspapers. In 1914, the paper was the first to report on the sinking of the *Titanic*. It was the only paper in the world to publish the entire Treaty of Versailles in 1918. In 1927, the *Times* attained exclusive worldwide rights to Charles A. Lindbergh's personal account of his New York to Paris flight.

When Ochs died in 1935, control passed to his daughter Iphigene Sulzberger, her husband Arthur Hays Sulzberger, and his nephew Julius Ochs Adler, as trustees of the Ochs Trust. Arthur Hays Sulzberger became the publisher, while Iphigene Sulzberger directed from behind the scenes. A passionate suffragist, she pushed the paper toward more progressive policies.

In 1945, a *Times* journalist, drafted into the military, was the only reporter on the Nagasaki bombing mission. In 1955, the paper published the entire 138,000-word transcript of the Yalta Peace Conference. Despite the Jewish background of the Ochs and Sulzberger families, the paper has been criticized for downplaying the Holocaust of

World War II and for some of its coverage of Israeli affairs. Arthur Sulzberger, in turn, passed control of the *Times* to his son-in-law, Orvil Eugene Dryfoos in 1963.

In December 1962, the company's printers, represented by the International Typographical Union, led a strike against the *Times* and other city papers, which dragged on for an unsurpassed 114 days. After the strike, the *Times* revenues were down by \$16 million, and daily circulation had dropped 80,000, making it the costliest strike in New York's history. Dryfoos felt personal responsibility for the crisis and the stress took its toll on his health. He died of heart failure, aged only 50, in 1963.

Arthur Ochs "Punch" Sulzberger, son of Arthur Hays Sulzberger, took over as publisher after Dryfoos' death. The younger Sulzberger served as publisher until 1992 and is credited with turning the *Times* into a public corporation, with its 1967 offering of stock shares. Sulzberger oversaw the initial publication of the *Times*'s national edition in 1980. Punch appointed Abraham Michael "Abe" Rosenthal, an influential *Times* reporter who won a Pulitzer Prize for his international reporting, to the position of executive editor, in which Rosenthal served from 1977 to 1988. In Rosenthal's 2006 obituary, *Times* writer Robert McFadden described Rosenthal as "a principal architect of the modern *New York Times*."

The *Times* was the first paper to report on General William Westmoreland's request for 200,000 troops in Vietnam following the Tet Offensive of 1968. In 1970, the op-ed section was added opposite the editorial page and, in 1971, the Business section was added. The *Times* won the Pulitzer Prize for its critical coverage of the causes behind the *Challenger* space shuttle explosion in 1986, which killed all seven astronauts on board.

Arthur Ochs Sulzberger Jr. became publisher in 1992. He oversaw the *Times*'s transition to the Internet and appointed Howell Raines, another Pulitzer Prize-winning *Times* journalist, as executive editor in 2001. But Raines resigned just 2 years later following the scandal over Jayson Blair, a *Times* reporter who resigned admits charges of plagiarism and fabrication in his reporting.

Sulzberger Jr. oversaw the transition of the *Times* to digital and, despite newsroom cuts and declining advertising revenue, worked to create an

economically viable newspaper. In response to massive revenue losses for traditionally advertiser-supported media outlets, Sulzberger led the *New York Times* in 2011 in creating a paywall, requiring subscriptions for full access to content.

In 2017, the Ochs-Sulzberger family appointed 37-year-old Arthur Gregg Sulzberger, who goes by A.G. or Arthur, as the new publisher. A.G. marks the sixth *Times* publisher from the Ochs-Sulzberger family. A.G follows in the footsteps of his father Arthur Ochs Sulzberger Jr. and his grandfather Arthur Ochs (Punch) Sulzberger, who were successive *Times* publishers.

Women at the Times

The New York Times, like many other newspapers, has had a long history of gender-based discrimination. Compared with other major U.S. papers, however, the *Times* took longer to elevate women into positions of power in the newsroom. Adolph S. Ochs opposed hiring women. Gender hiring discrimination continued at the *Times* during World Wars I and II, a time when more women were entering the workforce and other major papers were increasing their female staff. From the beginning of Ochs' tenure in 1896 until 1935, only four women worked as reporters in the *Times* city room. Sara Jane Clarke, hired in the 1850s, was the first female reporter on the payroll, working under the pen name Grace Greenwood. In 1869, Maria Morgan became the first woman to have a desk in the *Times* city room, the heart of news operations. In 1921, Anne O'Hare McCormick began writing stories for the *Times*, but was not put on the payroll until 1936, a year after Ochs' death. In 1937, McCormick, who had interviewed Joseph Stalin, Adolf Hitler, Benito Mussolini, and Franklin D. Roosevelt, became the first woman to win a major category Pulitzer for her foreign correspondence coverage.

Women who were employed by the *Times* were mainly assigned to the "Food, Fashions, Family, Furnishings" division, known as the *Four Fs*. The one-page section ran from 1955–1971. The Four F's offices were located far from the main newsroom. Betsy Wade, the *Times* first female copy editor, got her start in the section.

On February 1, 1972, Wade led a small group of women from the *Times* in founding the

Women's Caucus to address discriminatory practices. They later drafted a letter to the publishing family and directors documenting salary inequality, raise discrimination, and violation of civil rights. In 1974, seven discrimination lawsuits were brought against the *Times* in the U.S. Southern District Court of New York. In 1977, the judge approved a petition to pursue *Boylan v. New York Times*, a class action suit including 550 women. It was settled out of court in 1978.

In 2011, Jill Abramson became the first female executive editor in the paper's 160-year history. She was fired less than 3 years later with no clear explanation. Her departure was followed by the appointment of Dean Baquet, the *Times* first African American executive editor. In 2018, Monica Drake was promoted to assistant managing editor, becoming the first African American woman featured on the *Times*'s print edition masthead.

"Actual Malice"

New York Times Co. v. Sullivan, a 1964 U.S. Supreme Court case, ruled public officials and people running for public office have a higher standard to prove in defamation cases, which are cases that assert harm to reputation through the publication of false information. *Times v. Sullivan* established the principle that the First Amendment guarantees of freedom of speech and press protected strong criticism and even inaccuracies about public officials in order to foster vigorous debate about government and public affairs.

The case arose from a full-page ad, "Heed Their Voices," published in the *Times* on March 29, 1960. The Union Advertising Service for the Committee to Defend Martin Luther King and the Struggle for Freedom in the South, a civil rights group, paid for a full-page ad, which included text critical of violence against civil rights activists and the Southern justice system. L. B. Sullivan, an elected commissioner of the city of Montgomery, brought a civil libel suit against the *Times* for the ad's content. The suit eventually moved on to the Alabama Supreme Court, which ruled in favor of the plaintiff, stating that the *Times* ad had identified and defamed the plaintiff. The defense could not argue truth (the standard defense), as there were factual errors in the ad. The case was appealed by the *Times* to the U.S. Supreme Court.

The Court unanimously ruled in favor of *The New York Times*. Writing for the Court, Justice William Brennan said, "A state cannot under the First and Fourteenth Amendments award damages to a public official for defamatory falsehood relating to his official conduct unless he proves 'actual malice'—that the statement was made with knowledge of its falsity or with reckless disregard of whether it was true or false." The Court also held that falsity is not sufficient to warrant the award of damages to public officials in libel cases.

Pentagon Papers

The Pentagon Papers was the informal name of a 47-volume, 7,000-page classified study commissioned by the Pentagon to assess U.S. policy and planning in Vietnam. The study was made public in a *Times* series that began on Saturday, June 12, 1971. *The Washington Post* and other papers soon picked up the story. The publication of the stories and the ensuing Supreme Court case (on whether the papers were within their rights to publish secret government documents) were significant because they dealt with government accountability, censorship, and First Amendment rights.

The Pentagon Papers were classified as top secret-sensitive and only 15 copies of the final study were produced. Former RAND and Pentagon researcher Daniel Ellsberg leaked the Pentagon Papers to *Times* reporter Neil Sheehan. Familiar with the Papers from his work at the Pentagon, Ellsberg was convinced that making the documents public could stop escalation and continuation of the unpopular and devastating Vietnam War. There was significant debate among the top officials at the *Times* over whether or not to publish the Papers, and if so, how. In the end, publisher Arthur Ochs Sulzberger approved a 10-part series, with a six-page daily limit.

On June 14, 1971, the day after publication of the initial report on the classified documents, Attorney General John Mitchell requested that the *Times* halt publication of the series, claiming that publication posed a significant and immediate threat to national security. On June 15, the government won a temporary restraining order against the *Times*, which stopped publication. The order was later extended to *The Washington Post* when they commenced publication. The *Times*

appealed the injunction against publication to the Supreme Court, arguing that the restraining order constituted prior restraint in violation of its First Amendment rights. Relying on language from the 1931 *Near v. Minnesota* decision, the government argued that publication posed a threat to national security, which trumped the First Amendment rights of the press. The Court ruled 6 to 3 in favor of the *Times*, issuing a per curiam opinion (one that is not signed by any one justice) which stated, “Any system of prior restraints of expression comes to this Court bearing a heavy presumption against its constitutional validity . . . [The government] thus carries a heavy burden showing justification for the enforcement of such a restraint.” Weakening the precedent-setting value of the decision, however, there were nine separate opinions, none joined by more than three justices.

The Court’s decision affirmed that the First Amendment rights of *The New York Times* and *The Washington Post* to publish the Pentagon Papers could not be abridged by the government. At the same time, the court did not hold that prior restraint was always unconstitutional. There was no evidence that the publication of the Pentagon Paper harmed the U.S. military, defense, intelligence, or international affairs. Nor did publication lead to the end of the war. What publication did do was fuel the fires of public debate over U.S. involvement in Vietnam.

Controversies

Beginning in 2001, *The New York Times* published multiple stories outlining Iraqi President Saddam Hussein’s plan and capacity to develop and stockpile weapons of mass destruction. This coverage is credited with drumming up support for the administration of President George W. Bush’s plans to invade Iraq, although much of the information was later found to be false and based on claims from Iraqi defectors who wanted to overturn Saddam Hussein’s regime. In an editors’ note published in 2004, *The New York Times* said its reporting on the claims about Iraqi weapons of mass destruction “was not as rigorous as it should have been” and that even when its reporters wrote articles calling into question those claims, those articles were not displayed as prominently as the original articles.

After his 2016 presidential election win, Donald J. Trump routinely began criticizing the *Times*, calling the paper such things as “fake news,” “an enemy of the people,” and “the failing *New York Times*.” In June 2019, President Trump accused the *Times* of “virtual treason” for publishing a story related to international relations between the United States and Russia. The story included information potentially embarrassing to Trump including how the Pentagon was hesitant to share information with Trump due to privacy concerns. In response to the article and Trump’s reaction, Trump’s National Security Council stated they did not have any national security concerns about the *Times*’s coverage. Banquet and A.G. Sulzberger also accused Trump of endangering the lives of journalists due to his repeated personal attacks on journalists, including calling them un-American and enemies of the people. Despite this series of conflicts with Trump, the paper has at times been criticized for seeming reluctance to characterize his comments or policies as racist or sexist.

Under the leadership of editorial page editor James Bennet, whose tenure began in 2016, *The New York Times* op-ed page became a source of controversy. The page ran a number of extraordinary opinion pieces from contributors who regular readers found unacceptable for views on climate change and foreign policy, among other topics. One such controversy occurred in June 2020 when the *The New York Times* published an op-eds by Arkansas Senator Tom Cotton, a Republican and Trump ally, calling for the U.S. military to respond to civic unrest in American cities during Black Lives Matter protests. Outrage and criticism came from *The New York Times* newsroom, with staffers sharing screenshots of the op-ed’s headline online with some version of the comment “Running this puts Black @NYTimes staff in Danger.” Initially, A.G. Sulzberger and Bennet defended the paper’s decision to run Cotton’s op-ed; however, due to mounting criticism, A.G. Sulzberger announced Bennet’s resignation in June 2020.

COVID-19

At the epicenter of the first major U.S. COVID-19 outbreak, *The New York Times* provided extensive coverage of the novel coronavirus. On May 24, 2020, as U.S. deaths by COVID-19 reached

100,000, the *Times* published on the front page of the Sunday paper the names, age, and a personal detail about 1,000 people who died from the virus, representing 1% of total fatalities.

In the first quarter of 2020, the *Times* saw the biggest increase in subscriptions since it established the paywall in 2011, mirroring an uptick in subscriptions and readership for many local and national papers. By April 2020, digital subscriptions topped six million, an all-time high. Subscription and total revenue increased during the same period. However, advertising revenue continued to fall, following a previous trend, but exacerbated by the economic toll of COVID-19.

For most local and national U.S. newspapers, the economic effects of the pandemic and dwindling advertising dollars led to sweeping layoffs, furloughs, and closures despite increases in subscribers; however, this has not been the case at the *Times*. *Times* Chief Executive Mark Thompson attributes the relative success of the *Times* to the paper's preexisting transition to relying less on advertising. For the *Times*, its market reach, transition to digital, diversification, and subscription model provide power in times of economic uncertainty.

NEWS AGGREGATORS

News aggregators combine computer software, algorithms, and journalistic practices to enable writers, editors, and audiences to collect news stories and other information as they are published by news providers and to organize the information in a specific, personalized manner. This practice can be accomplished in several ways, but the most common is the use of HTML coding on the websites of newsgathering organizations to create RSS feeds and other public notifications of instant updates to news content. News aggregator applications are installed on users' mobile devices, home assistants, and computers. These programs regularly search for updated information from newsgathering organizations and compile it for a news feed. The term *news aggregators* can also refer to websites and online publishers that republish RSS feeds, news stories selected using search engine optimization, information from newswire services, publishers, social media feeds, and other primary and secondary news sources.

News aggregation is based on the concept of content syndication, where content created by one or more newsgathering organizations is distributed through a different organization. Historically, syndication involved republication of both hard and soft news content by newspapers in different locations. These newspapers paid the initial publishing source (often a large metropolitan daily newspaper) for the limited right to reprint the stories. The nature of syndication has changed as technological advances allow for more information to travel much greater distances. Online journalism allows for more and different types of syndication, particularly the syndication of headlines and breaking news scoops.

Most news aggregators are web based: they deliver RSS feeds and other content using web browsers. However, other aggregators use stand-alone software that connects to the Internet to deliver RSS feeds and other content. Well-known news aggregators include Google News, Apple

News, and the MSN Start Page. Other news aggregators have been designed to display news feeds as scrolling screensavers or to send news feeds directly to an end user as a daily email digest. Many social media platforms are designed to act as personalized news aggregators. Feed scroll applications and websites (e.g. Twitter, Facebook, Tumblr) and group-voted link ranking and curation (e.g. Reddit, Digg, Slashdot) are the two most common forms of social media news aggregation practices and applications. This entry further discusses syndication and the evolution of news aggregators. It then looks at contemporary media theory related to news aggregators and ongoing changes in the use of news aggregators.

Syndication and the Evolution of Aggregators

While web-based news aggregators are a relatively recent phenomenon, they have their roots in news agency reports carried in local newspapers, which attempted to provide a local angle on stories for their readership. This practice developed into the familiar newspaper sections still in use today, such as the front page, editorial page, international section, sports section, and so on. In the late 20th century, most major metropolitan daily newspapers began to publish zoned editions, which carried both the main sections of the newspaper, plus an added section (or sections) of news specific to a subregion within the metropolitan area. While this practice of audience segmentation was common in newspapers, it was less common in local broadcast journalism as there was no practical method to focus stories for only part of a region. Before the rise of online journalism and newsgathering beginning in the 1990s, feature syndication had become a widely accepted news practice. Importantly, however, it was still practiced under the control of traditional news editors.

When newspapers began publishing on the Internet, they extended these practices into the online space: Sections of printed newspapers usually became separate sections within the overall websites. Since online versions of newspapers required no printing and distribution costs, the number of niche audience or local editions could be expanded, increasing geographic customization and demographic personalization. Stories could be

expanded and more photos—or even video—provided. The rise of independent intermediate websites that collect and republish headlines and hyperlinks began to erode the impact of traditional news editors. The social and political effects of a 24-hour news cycle in journalism (begun with cable news services and greatly expanded online) began to create expectations that print and broadcast news editors should provide near-constant updates and headlines.

In the 1990s, Ramanathan Guha created protocols for meta content framework formats while working for Netscape and Apple. This research was systematized as Resource Description Framework. There was no trademark or patent granted, making the protocols effectively open sources. RSS, originally an abbreviation for Resource Description Framework Site Summary and later said to stand for both Really Simple Syndication and Rich Site Summary, was released in 1999 and became the standardized software protocol that news websites use to publish updated headlines onto the World Wide Web through publication of data and metadata tags on their websites.

RSS 2.0 was released in 2002. RSS is a “pull” protocol, and not the same as web-based broadcasting, which is a “push” protocol. RSS feeds are effectively passive and must be constantly searched for, although this searching can be, and almost always is, automated. Further complicating this process, the intermediate sites that collect and republish RSS feeds are often called *news aggregators*. Such naming is misleading because it confuses individual practitioners with the overall practice. The newsgathering organization, intermediate websites, and end users all engage in the same process of acting as news aggregators, and increasingly the distinctions between them are disappearing.

Using these RSS feeds, intermediate sites collect new information, and end users can select and compile information based on their needs and interests. This developing feature of journalism allows for very personalized editorial control and continues to evolve and to change the way in which individual audience members and readers interact with their news. The upsides to the growing use of news aggregators include the increased relevance of selected news to the end user, faster access to breaking news, advertising that is more

targeted, and an increased personal agency for an audience that had been passive. Among the downsides to the growing use of news aggregators are the increased pressure on journalists for speed and scoops, the erosion of the distinction between newsgathering and republication, intrusive generalized advertising, and lack of any professional editorial role.

Contemporary Media Theory

Media theorists and technology pundits have made many predictions regarding the effects of online publication of newspapers and the rise of news aggregators. The balance of increased personal agency and decreased professional editorial control were popular topics of speculation and research even before the technologies had been fully developed. As early as the 1960s, Marshall McLuhan had predicted an anarchic computer web and expected that some form of personal organization would be necessary. In the mid-1990s, Nicholas Negroponte coined the term “the Daily Me” to describe the interface with which end users would receive, customize, and manipulate information. Negroponte envisioned a prototype “digital newspaper,” either in the form of an on-screen interface or a portable device, that would receive information constantly and arrange it in a personalized format.

Open-source movements have actively lobbied to keep standards open and to mitigate the effects of corporate ownership of media. These advocates have pushed for open web standards like XML and the Atom syndication format for the publication of news feeds, as well as free open-source software for stand-alone news aggregators. In theory, these open source aggregators allow for both commercial content and advertising while preserving the prerogative of intermediate websites and end users to copy and republish RSS feeds. More recently, media theorists such as Henry Jenkins and Cass Sunstein have stressed the complex interactions between existing corporate structures of newsgathering, evolving technologies for cataloging and moving information, and an active audience that self-organizes around emerging dynamic demographics or specific points of view.

Probably the most notable feature of the effect of online news aggregators on journalism is that

of homophily, “love of sameness,” the sociological theory that similar individuals will move toward each other, and act in a similar manner. Coined in 1954 by social scientists Paul Lazarsfeld and Robert Merton, the idea of homophily has been expanded by evolving media technologies, enabling demographically or politically similar individuals to seek out news sources that agree with their preconceived views. But homophily also describes the likelihood that users will thus exclude news sources that challenge or disagree with those pre-existing views.

News aggregators can create hyper homophily by allowing an end user to maximize exposure to agreeable news while minimizing exposure to new and conflicting information and create an “echo-chamber effect” of personal information feedback. Combined with algorithms for automated personalized selection of news, these ideas were expanded into the concept of the “filter bubble,” coined by Eli Pariser to refer to political, intellectual, and cultural isolation from disagreeing viewpoints. The filter bubble differs from general homophily in that the end user is unaware that news stories are being excluded from their news aggregators or may be unaware of alternate viewpoints altogether.

Continuing Changes

Most social media newsfeeds, including Facebook, Twitter, and LinkedIn, use automation and algorithms to function as news aggregators by republishing professionally created and edited news alongside amateur content and personalized information. Digital video recorders, such as TiVo, and most cable and satellite home hardware boxes, can also function as content aggregators, recording content as it is broadcast and cataloging it for later viewing.

Despite the erosion of traditional news editors, much of the audience of news websites and newspapers still prefer professional editorial oversight, design, and content selection. These readers use a mixture of information from news aggregators and from more traditional, edited sources. The continuing use of news aggregators has not displaced traditional news publications, but it has altered how news is written and distributed.

sense, can be defined as a structured account of one or more protagonists undergoing a series of events. Journalistic storytelling, in particular, uses different kinds of narrative conventions across a variety of genres (e.g., reportage, report, first-person narrative) in various forms of media (print, audio, video, digital).

Even though journalistic forms and formats often seem homogenous and uniform, they have significantly changed over time. News as narrative, then, is a rather recent phenomenon that emerged in the second half of the 20th century and fundamentally altered some practices, values, and norms in journalism, particularly in the United States. A number of scholars have shown that news organizations in the United States moved away from a straightforward chronicling of daily events. Instead, journalists began pursuing a more interpretive approach, using more subjective, explanatory, and contextual elements in their presentation of news.

Between the 1960s and the 2000s, American journalism experienced a variety of cultural and institutional influences that created enabling conditions for reporters and editors to redefine the news genre and their professional roles toward encompassing more narrative, and thus more emotional, storytelling. In part, the evolution of news as narrative grew out of changing pressures on the news industry. In the 1960s and 1970s, journalists were coming to terms with changing lifestyles and the end of the New Deal consensus. In the 1980s, economic transformations and new business realities created opportunities for narrative storytelling but also pushed journalistic writing more toward commercial objectives. In the 1990s, when Americans were experiencing affluence and abundance after the Cold War had ended, journalism was exposed to and contributed to the mediatization of public life. Against this backdrop of both gradual and decisive social, economic, political, and cultural changes in the United States, news as narrative expanded the scope and mission of what journalists were doing. In addition to the traditional objective of journalism to answer the question of “What happened?”, narrative techniques allowed reporters and editors to address the questions “What does it mean?” and “How does it feel?”. Critics of this development contend that news as narrative prioritizes

NEWS AS NARRATIVE

All forms of news are constructed in a narrative way, but some forms of news are more narrative-driven than others. Narrative, in its most common

human interest at the expense of structural analysis, dramatizes instead of illuminates, offers light entertainment instead of public service, and leads to trivial stories driven by a desire to please commercial interests.

In the context of journalism scholarship, scholars have focused on studying three different dimensions of narrative. They have examined narrative characteristics with regard to the *production of news*—both in terms of news as general narratives and journalistic stories as narrative news. Secondly, they have emphasized the *cultural functions* of journalistic storytelling with respect to its mythological features as well as its patterned structures of meaning. Finally, scholarship in the area of journalistic narratives analyzed *epistemological implications*, examining how different types of narrative reflect different ways of knowing. This entry discusses these three strands of research, along with the development of new forms of storytelling in response to technological change.

Report Versus Story

As with other systems of symbolic forms, the production of news can be understood as a set of conventions shaping the content of information. There are two basic kinds of conventions: report and story. The news report offers a systematic explanation of current or past events, typically structuring the information in the form of an inverted pyramid with the most important part of information at the beginning and other aspects organized in descending order of relevance. News writing in general is characterized by conventions, maintaining the illusion that the presentation of the news is natural and neutral when in fact it is always already structured by implicit news values. The news report is a narrative convention that makes one forget it is a convention. As a result, scholars have been eager not only to demonstrate the constructed character of news reports but also their potential ideological side effects, privileging, for example, the perspective of government elites and professional experts over the experiences of regular people.

Narrative news stories, on the other hand, foreground stylistic elements such as character, plot, descriptive detail, and point of view with the goal

of creating an immersive experience often designed to elicit emotional responses from readers, viewers, or listeners. This kind of journalistic storytelling borrows literary techniques to create reality effects, that is the illusion of being in the presence of reality itself. Consequently, scholarship has shown how journalists deliberately and strategically craft emotionally engaging narratives to highlight the lived experiences of people, dramatizing the large and often abstract events of which news is made. At the same time, critics of narrative journalism contend that this form of news prioritizes human interest at the expense of structural analysis, offers light entertainment instead of public service, and leads to trivial stories driven by a desire to please commercial interests.

News as narrative, however, is not just a result of symbolic conventions in the context of news production. It is also determined by social conventions and organizational practices of reporting. As early as the 1970s, scholars explored how professional practices and occupational routines shape aesthetic conventions. They challenged the notion of news as a creative endeavor and instead emphasized the organizational pressures of a highly standardized manufacturing process. Nonetheless, scholarship also documented how narrative journalists were employing a specific set of reporting techniques more akin to the strategies of anthropologists and ethnographers. What this line of research established was the observation that narrative journalists were in a permanent tension to reconcile the demands of storytelling with the challenges of factual reporting. The discussion about determining the border between fact and fiction triggered lively debates between journalism scholars and literary theorists.

Cultural Functions of Journalistic Narratives

The cultural functions of journalistic storytelling become apparent when we think about storytelling as an intrinsic and constitutive element of what it means to be a human being. If humans are storytellers, then different kinds of storytelling help construct particular social meanings. Some scholars have argued that news stories are modern forms of myths, emphasizing the universal character of stories in establishing a sequential and

semantic order where none had been before. While some scholars sought to identify mythical archetypes in news coverage (e.g., the hero, the outcast, the traveler), others were more interested in the narrative capacity of journalists to create mythic figures in the context of public rituals and collective meaning-making, thereby asserting their authority in the public sphere. Yet, research has also shown that not all forms of journalistic storytelling provide closures to public forms of meaning-making. At the same time, as much as journalists may attempt to legitimize their roles as storytellers by advancing unresolved storylines, they also have to consider the role of audiences and other public actors to resist, reinterpret, and redefine dominant narratives.

More broadly speaking, the term *news narrative* can also denote dominant interpretation of events or processes. Storytelling in this context constitutes a collective effort at constructing dominant interpretations of reality, a kind of framing, that results in news as an interpretive form of collective discourse, privileging some story lines and concealing others. As a range of scholars have contended, these narrative frames promote conventional ways of seeing and may reinforce existing ideologies. At the same time, however, the collaborative nature of dominant frames also opens opportunities for allowing a wide range of voices and viewpoints.

Epistemological Dimensions

When examining news as narrative, scholars have also focused on conceptualizing narrative characteristics of news writing as different ways of knowing. Narratologists pointed out that narrative representations are different from, yet not inferior to scientific knowledge. As much as science offers exact measurements, say for capturing temperature, the act of storytelling can provide a specific account of what it felt like to dip a toe into freezing water on a particular day. Some scholars have tied this ability to address emotional experiences to a systematic and strategic practice of journalists to infuse their reporting with emotion, thereby foregrounding personal experiences in addition to telling the facts.

But these subjective experiences are not the only types of knowledge that news as narrative

renders accessible. Since narrative inherently offers a particular strategy to interpret the interconnect-edness of basic categories such as time, process, and change, news as narrative also has an objectifying dimension, revealing characteristics of social life and the human condition. As a result, this kind of journalistic storytelling has been identified as an efficient strategy to foster empathy as well as create opportunities for understanding otherness.

The interpretive approach of news as narrative has frequently spurred debates about the boundary between fact and fiction. While literary theorists were keen on deconstructing the porous border between reality and imagination of nonfiction writing, journalism scholars emphasized that interpretive writing must not give way to fabrication, manipulation, and deceit. The underlying question in these debates was how storytelling affected one of modern journalism's core normative values: objectivity. The latter evolved over the 20th century and provided journalists with a conceptual anchor to express their role in society, emphasizing a privileged position for holding the powerful accountable. While critics of news as narrative argued that storytelling was undermining objectivity, others highlighted how the interpretive approach, as long as it is embedded in journalistic ethics and values, may actually augment the capability to convey information in objective, yet multidimensional ways.

New Forms

News as narrative is a cultural practice that is constituted by institutional and organizational characteristics within specific media systems. At the same time, narrative techniques shape and constrain the representation of social and political reality. Narrative as news, then, can best be understood as a reflexive process of meaning-making in the realm of news and institutionalized public debate. As technology keeps transforming the media landscape, journalists are adapting both to new platform of storytelling and new narrative modalities. The strands of scholarship mentioned earlier are being updated and expanded in response to technological change. New forms of storytelling, such as podcasting, virtual reality, 3D experiences, "gamified" news, data journalism, and

automated journalism, make it necessary to examine traditional conceptualizations of narrative and develop new strategies for assessing the narrative characteristics of these journalistic representations. Scholars will have to trace and analyze if and to what extent these new iterations heighten inherent tensions of news as narrative (e.g. reason vs. emotion, objectivity vs. subjectivity) and how journalists create novel conventions and routines around technological affordances.

NEWS AUDIENCES, U.S.

News audiences in the 21st century are rapidly changing, particularly as new technologies open news media to consumers who cannot or will not pay for their information. At the end of the 19th century, newspapers dominated and directed public life and conversation. The penetration of television into American daily life in the mid-20th century established the nightly news program as the arbiter of public life. Now in the 21st century, legacy news organizations are struggling to adapt to a new media environment dominated by instantaneous, Internet-driven communication channels, social media, and on-demand entertainment content. Younger generations are accessing a multitude of news sources rather than relying on one source, rendering it difficult to get a true snapshot of who is consuming news and how they are doing it.

Shifting news media consumption channels have driven legacy media companies into consolidation and bankruptcy, and media watchers' prognostications show a bleak future for print newspapers and broadcast news organizations that do not adapt quickly to Internet and streaming media paradigms. In 2018, the Pew Research Center reported that people who consumed news on social media surpassed those who got their news from newspapers for the first time; however, this does not mean that audiences trust the news they get from social media. Pew also reported that 57% of those who said they got their news often on social media also said they expect inaccuracies and falsehoods to riddle their online news.

Understanding today's news audiences requires looking at the changing paradigms of news consumption during the 20th and 21st centuries and the economic and social pressures pushing news consumers toward online, interactive news mediums and away from legacy news mediums, such as

newspaper and television. This entry first discusses the changing habits of U.S. news audiences and the effects on newspaper circulation and television viewership. It then looks at news audiences in the immediate aftermath of the election of President Donald Trump, the fragmentation of news audiences during the 21st century, and the loss of many local sources of news.

Newspaper Circulation and Television Viewership Losses

Newspapers were the dominant public communication medium in the United States at the turn of the 20th century. At the height of its run, the yellow journalism staple the *New York World* had a circulation of around 1 million subscribers. Total national circulation for all U.S. newspapers, which numbered around 7,000 daily and weekly publications in 2019, shows a much different readership base. The Pew Research Center noted that total weekday newspaper circulation in 2018 was around 28.6 million people, and Sunday circulation, which had fallen about 13% between 2017 and 2018, was 30.8 million. Digital circulation is difficult to calculate because it is self-reported by each outlet, and some publications don't report their full numbers to the Alliance for Audited Media, which audits circulation figures for the largest print publications in the United States and is where the Pew Research Center gathers its numbers. The numbers from 2018 show that national circulation figures for newspapers were lower than they were in 1940, when numbers first started being officially documented by *Editor & Publisher*. In 1940, national weekday circulation was around 41.1 million and Sunday circulation was 32.4 million.

The evening television news report captured and dominated news audiences from the mid-20th century; however, even television news is challenged when it comes to finding and securing the scattered news audience's attention. While cable news received a revenue bump from the 2016 elections, local news audiences remained in decline, according to the Pew Research Center's State of the News Media in 2018 report. In fact, local TV news saw the steepest drop in viewership of any of the news mediums analyzed, including newspapers and digital news channels.

The erosion of television news viewership of the three nightly news broadcasts was documented as early as the mid-1990s. A 1996 Pew Research Center study found that young adults and computer users, in particular, were leading large declines in public consumption of print newspapers, local nightly news broadcasts, and cable news channels. The erosion of viewership was steep between 1993 and 1996, with only 42% of respondents saying they watched a nightly news broadcast in 1996. In 1993, 60% of respondents said they watched one of the three network nightly news broadcasts. Newspaper consumption was steady at around 50% in 1996. The only winner in 1996 was local news broadcasts, which saw a slight increase in consumers who only viewed local news and consumed no other news broadcasts between 1993 and 1996. This report also documented a decrease of people who consumed two or more news sources a day.

Pew Center studies on media consumption habits in the 2000s continued to show slow declines in TV news consumption and an accelerated loss of print outlets and print audiences. Around 1,800 newspapers in the United States, most of which were weeklies, shuttered their operations between 2004 and 2019. This left many communities with only one or, in more than 170 U.S. counties, zero newspapers, pushing those communities into the growing number of so-called news deserts nationwide. In 2018 and 2019, print newspapers ranked lowest among the ways that U.S. news consumers got their news.

In 2002, 41% of respondents to the Pew survey said they'd read a newspaper in the last day. By 2012, that number had fallen to 23%. By 2018, only 16% of respondents read newspapers. More than 50% of the survey respondents watched television news in 2006, but that number had slipped below 50% in 2012. However, in 2018, cable news revenue was rising, viewership was up 8%, and local TV news revenue rose, as well, although viewership for both morning and evening newscasts was down more than 10%. The Pew Research Center notes that the rising ad revenue in 2018 could be attributed to a midterm election bump.

Trump Bump

The 2016 election of President Trump produced a short-lived boon for the news industry. In a

so-called Trump bump, the nation's largest dailies—such as the *New York Times* and the *Wall Street Journal*—saw an increase in subscribers and readers, particularly digital readers, in 2016 and 2017 as consumers sought reliable, factual sources of news. The Trump bump also produced an increase in numbers showing the public's trust in the media. Public trust in the media hit bottom at 32% in 2016, according to Gallup; however, by 2018, those numbers had risen to 45% of the public saying they trusted the media. However, this is still much lower than the 1970s, when trust in the U.S. media hit a high of 72%.

The Trump bump leveled off quickly, with subscription numbers falling quickly throughout 2017. Many publishers saw little to no boost in advertising revenue, and many of the news readers that were attracted to publications read them in digital format and did not pay for the content they viewed.

Fragmentation of News Audiences

There are several reasons for declining print news readership and television viewership numbers, including the implementation of the World Wide Web in 1991, which led to the increasing demassification of media, and a jaded public that increasingly showed a lack of trust in news media, regardless of medium.

Where 20th century media relied on their roles as the gatekeeper or arbiters of information, delivering the information they thought most pertinent, 21st century media breaks down the supremacy of the gatekeeper and allows audiences to determine the content they consume with no intermediary between the source and receiver of information. Where 20th century media relied on mass audiences, 21st century media audiences are demassified. In other words, 21st century media—led by the Internet's ability to proliferate niche websites, blogs, and podcasts—reach fragmented groups of smaller and specialized audiences.

Theories about demassification of audiences increasingly see media consumers as active participants in choosing media content and that various audiences prefer different content for their individual uses and personal gratifications. Uses and gratifications theory, originally developed in the 1970s by Elihu Katz, Jay Blumler, and Michael

Gurevitch, explains the explosion of social media as a primary venue for people seeing and consuming news, as social media fulfills people's need for human interaction, approval, relationships, and connections over shared interests. This assumes that an audience in a world with media demassification is an active, empowered audience that picks and chooses media sources to fulfill their personal needs, which Katz, Blumler, and Gurevitch found can include needs to be educated, to identify with others, to be entertained, to be socially fulfilled, and to escape.

Demassification has benefited media in that it has allowed highly specialized outlets to find audiences, although not necessarily advertising dollars. It has also benefited audiences in that readers and viewers no longer have to watch general shows to gather a small amount of information on a specific, possibly offbeat or out of the ordinary, topic. At the same time, subaltern or alternative publics that had not made it into mainstream media sources have been able to find an outlet for their ideologies in the demassified media marketplace.

Non-mainstream media sources have been called a wide range of names, from participatory, citizen, and community media to grassroots, autonomous, and radical media. There is a both tension and a symbiotic relationship between niche media audiences and producers and mainstream media producers and audiences. The mainstream media producers pick up stories and ideas from alternative media sources and nondominant media producers create communities and distribute information that unifies smaller groups of people around a single idea that is broadcast through the group members and then beyond via social media and other personalized distribution channels. An example of this is a news story that quotes tweets as its evidence. The tweets were created for a niche audience, distributed through a social media network, and further distributed via the mass medium of a television cable news network or a newspaper.

Demassification did not start with the Internet. The 20th century was marked by the increasing division of radio, television, and print publications into specialized topics. The magazine industry embraced demassification of audiences and topic specification as an industry survival tactic. Just a few examples of special interest magazines that

exemplify the splintering of audiences include *Twins*, *Car & Driver*, *Better Homes & Gardens*, *Simply Knitting*, *Food & Wine*, and *Teddy Bear Times & Friends*.

However, the Internet certainly accelerated the fragmenting audience. Audiences seeking information that confirmed their opinions and expectations were accused of creating echo chambers where readers were able to hear information that agreed with their point of view echoed to them and reinforced. Pew's 1996 numbers show that the Internet had an effect on news consumption habits soon after it was made available to the public with the implementation of the World Wide Web, but the 2000s accelerated the consequences of news consumers having instantaneous access to information.

In 2018, 20% of respondents said they got news often from social media. Just one year later, the Pew Research center found that 55% of American adults got their news either often or sometimes through social media, with almost a third of respondents saying they got their news "often" from social media. The split between young adult use of media and the ways that older generations use media is increasingly revealed by the shifting of audiences from fixed, schedule-bound programming to on-demand, streaming media. As Rasmus Kleis Nielsen and Richard Sambrook observed in the executive summary to the 2016 report, *What Is Happening to Television News*,

There are no reasons to believe that a generation that has grown up with and enjoys digital, on-demand, social, and mobile video viewing across a range of connected devices will come to prefer live, linear, scheduled programming tied to a single device just because they grow older. (p. 3)

News Deserts

The declining number of newspapers and other legacy news outlets has caused many concerns about the growing number of news deserts, or regions with no official news sources for community news, across the United States. The study of news deserts is relatively new. Michelle Ferrier, a pioneer in studying the communities at-risk of losing their local coverage, developed the Media

Deserts Project in 2010 to use geographic data to visualize which areas of the United States had no local media at all and which areas had a high penetration of media coverage. A 2018 University of North Carolina School of Media and Journalism report found that one in five publications shuttered in the first part the 2000s.

For the most part, both of these studies show that the losses are highest in rural areas, where people tend to be poorer, less educated, and more vulnerable, although suburban areas had lost more than 70% of their outlets between 2004 and 2018, according to the UNC study. Half of the counties in the UNC study only had one paper, often a weekly, left by 2018, and almost 225 counties had no local paper left. The UNC study reported the highest losses were in the South, where 91 counties were without a local news outlet in 2018. The next highest number of news deserts was in the Mountain region, where 28 counties had no local newspaper in 2018.

News deserts are concerning because, without a local newspaper, local government affairs and events are left uncovered and residents are unable to fully participate in their communities' democratic processes without coverage. They're left out of conversations that could concern them, such as rising tax rates, the implementations of new policies, land use decisions, and other public conversations that determine the future of community growth and governance.

In some communities, digital initiatives have tried to step in to cover the holes in local news. However, these are risky at best as digital advertising dollars are hard to get, with Google and Facebook snagging at least 50% of the available money. The Poynter Institute reported that multiple studies have found it difficult for local news sites to gather enough visitors and income to be self-sustaining enterprises. In addition, a 2019 survey by the Pew Research Center found that two thirds of Americans are worn out by the amount of news they're receiving, a finding that has not changed significantly since the 2016 election cycle. Information overload and finding new revenue streams are challenges for news sources seeking to snag and keep the attention of today's news audiences.

NEWS AVOIDANCE

The phenomenon of news avoidance has recently gained substantial attention from both scholars and practitioners, as an increasing number of people seem to be turning their backs to the news.

This trend is potentially problematic as news consumption has several positive effects. At the individual level, it benefits political knowledge and engagement. In addition, news consumption has positive externalities (i.e., benefits for society beyond the individuals who consume the news). For example, people in power are less likely to engage in malpractice if there is a high risk of being exposed in public by journalists. If increasing news avoidance erodes the economic foundation of the news industry, these effects will fade. At the same time, however, news avoidance can have positive effects on people's mood and mental well-being. This complexity illustrates the importance of understanding the character of news avoidance and its underlying causes. First, this entry provides an overview of different types of news avoidance in terms of their nature (intentional and unintentional) and scope (consistent, occasional, and selective). Second, it provides a systematization of the underlying causes (individual-, content-, and contextual-level factors). Lastly, it outlines some important questions for a deeper and more detailed understanding of news avoidance.

Different Types of News Avoidance

In general, news avoidance can either be intentional or unintentional in nature. *Intentional news avoidance*, on the one hand, is based on a specific distaste for news that drives an individual to deliberately steer clear of news exposure. *Unintentional news avoidance*, on the other hand, is not based on a specific distaste for news, but rather stronger preferences for other types of media

content. It occurs in situations where consumption of other types of content, such as entertainment, squeeze out news exposure from an individual's general media repertoire. Thus, unintentional news avoidance is not an active opt-out of news in the same way as intentional news avoidance is.

In addition to the distinction between the intentional or unintentional nature, three types of news avoidance can be identified in terms of their scope: *consistent*, *occasional*, and *selective*. While consistent news avoidance can be both intentional and unintentional and is characterized by very low or no news exposure, occasional and selective news avoidance are entirely intentional and do not necessarily result in low news exposure. As such, consistent news avoidance is primarily concerned with a very low frequency of news consumption while occasional and selective news avoidance is more focused on the deliberate behaviors of restricting news consumption. Each type and how they have been studied in extant research is detailed in the following subsections. Their main characteristics are summed up in Table 1.

Consistent News Avoidance

A consistently low or non-existing news consumption can be both intentional and unintentional in nature. As such, the consistent avoidance of news is either a consequence of disliking the news in general or having a higher preference for other content.

Most studies focusing on this type of news avoidance rely on survey measures, but their analytical approaches differ. While some studies draw

Table 1 Different Types of News Avoidance and Their Main Characteristics

	<i>Types of news avoidance</i>		
	<i>Consistent</i>	<i>Occasional</i>	<i>Selective</i>
What is avoided?	News in general	News in general	Specific news content
What is the level of general news exposure?	Very low or non-existing	Not necessarily low	Not necessarily low
Is the avoidance intentional or unintentional?	Both	Only intentional	Only intentional

on cluster analysis or latent class analysis to inductively classify news avoiders based on general patterns in news exposure, other studies apply a cutoff point that distinguishes news avoiders from more regular news users. This cutoff point can either be relative to the average news exposure among respondents (e.g., one standard deviation below the average) or it can be defined by an absolute level of news exposure (e.g., the ones who report not to consume any news during an average day).

Although survey measures provide a potential foundation for systematic comparisons across countries and over time, this potential is rarely fulfilled due to the different analytical approaches. Instead, studies based on national representative samples have arrived at substantially different estimates of how large the group of news avoiders is. These differences are of a magnitude that is unlikely to be explained by cross-country differences alone but is at least partly due to the different methodological choices.

Other studies apply a qualitative approach to understand the group of consistent news avoiders. Through interviews with people with low levels of news exposure, these studies try to uncover how this group perceives the news and why they only to a very limited extent consume news. The aim of these studies is not to estimate the extent of news avoidance, but rather to gain a deeper understanding of the complexities behind it.

Occasional News Avoidance

The second type of news avoidance is characterized by an individual's occasional avoidance of news, which does not necessarily result in an overall low level of news exposure. Thus, an individual can intentionally avoid the news some of the time, but at the same time consume considerable amounts of news in general. This understanding is also clear from the operationalization of news avoidance in the empirical studies. For example, in the Digital News Report from the Reuters Institute for the Study of Journalism, survey respondents were asked "if they find themselves actively trying to avoid the news these days." Indeed, studies based on these data also show that this type of news avoidance has only a weak negative correlation with general news consumption.

Selective News Avoidance

The third type of news avoidance is characterized by avoidance of specific types of news content rather than news in general. This can be specific issues that dominate the media agenda at a given moment in time, such as a terrorist attack, a pandemic, or specific political issues. Thus, people selectively and intentionally avoid specific content that they have a distaste for. As such, this type of news avoidance is closely related to selective avoidance to political content in opposition to one's own political standpoint.

This type of news avoidance has been analyzed through both quantitative and qualitative approaches. While some studies follow developments in avoidance of specific news topics over time using panel surveys, other studies use in-depth interviews to understand why people avoid specific content, such as, for example, news about U.S. President Donald Trump.

Underlying Causes of News Avoidance

Extant research has illuminated different potential causes for news avoidance at different levels of analysis. To provide an overview, they can be divided into three groups of factors: (1) individual-level factors, (2) content-level factors, and (3) contextual-level factors. Differentiating the potential explanations into distinct categories can be helpful in thinking systematically about when and how different causes are most likely to affect news avoidance and how causes at different levels of analysis potentially interact.

Individual-Level Factors

When exploring causes at the individual level, it is important to distinguish between factors that are relatively stable (e.g., interest in news and politics, media trust, civic norms, sociodemographic variables) and more malleable factors that fluctuate over time and often have a more emotional character.

One of the most prominent motivations for news consumption is an interest in news and politics. Political interest has been demonstrated to be quite stable after being established through childhood and adolescence and can thus be seen as a dispositional interest. Studies of news avoidance

have found a lack of interest in politics and news to be a strong explanation for news avoidance. While media trust is likely to be less stable than political interest, studies have also identified media distrust as a prominent factor related to news avoidance. Thus, if people are not interested in or do not trust mainstream media, they are in general more likely to avoid news. Likewise, if people do not see news consumption as a civic duty, they are more likely to avoid news. In terms of sociodemographic variables, studies have shown contradicting results for how gender and education are related to news avoidance. In contrast, research has repeatedly demonstrated that younger people are more likely to avoid news compared to older people.

These quite stable individual-level factors are prominent explanations as to why some people are more likely to have a consistently low level of news exposure than others, but they also have an impact on occasional and selective news avoidance. For instance, people with low interest are more likely to engage with the news in periods when they are in higher need of the information, for example, during election time.

In terms of more malleable factors, research has pointed out that a substantial proportion of news avoiders' experience that the news has a negative effect on their mood. A feeling of news overload, fatigue, and paralysis have also been related to news avoidance. Although people in general have a slight preference for negative information, the plethora of available (negative) news can thus be counterproductive as information overload can create stress, confusion, and anxiety and lead to news avoidance.

While there is a risk that these less stable factors can lead to sustained and consistent news avoidance over time, they are also likely to serve as explanations for occasional news avoidance, where people avoid some of the news some of the time when news consumption affects their emotions negatively. Likewise, news overload can trigger selective news avoidance of specific issues, such as Brexit or the coronavirus pandemic. As states of negative mood and mental well-being as well as perceived news overload tend to vary both between individuals but also within individuals over time, they contribute to a more dynamic understanding of news avoidance and how

individual-level factors interact with content-level factors and context-level factors to explain different types of news avoidance.

Content-Level Factors

News avoidance is also influenced by characteristics of the news content. When news avoiders state that they do not trust the news, this is likely to be at least partly a result of biased news reporting. Likewise, when many people who avoid the news mention a negative impact on their mood or mental well-being, the precondition is that at least some news with a negative focus is available to them. It is reasonable to assume—all else being equal—that the more negative the focus of news coverage is, the more negative the general impact of news exposure on people's mood will be. Thus, more stable characteristics of the news, such as a negativity bias, can explain consistent news avoidance with a stable and low level of news exposure. However, the valence of current affairs news also fluctuates based on variations in news selection and in events and developments in the society that journalists cover. Thus, even though there are certain general trends in characteristics of news coverage, for example, a negativity bias, some news has a positive tone, and there is substantial variability in valence over time, which is especially likely to affect occasional and selective news avoidance.

In addition, as indicated earlier, these fluctuating content characteristics interact with individual-level factors in explaining dynamics in news avoidance. For example, people with different types of personality traits are likely to respond differently to negativity in the news. Thus, changes in content characteristics do not have a uniform impact across all individuals, and what makes some people avoid the news might motivate other people to expose themselves to more news. This makes it important to consider interactions between content-level factors and individual-level factors when explaining news avoidance.

Contextual-Level Factors

The final category of factors focusses on the context in which individual-level factors and news content are embedded. Contextual factors refer to environmental and situational characteristics,

which potentially impact the consumption and content of the news. Variation in such factors can appear across both spatial and temporal contexts. One of the most prominent contextual-level factors is the structure of media and news supply, which creates varying opportunity structures for news exposure across contexts. These opportunity structures vary both across countries and local information markets.

Opportunity structures also change over time—both long-term and short-term. The most prominent long-term change in opportunity structures is the development from a low-choice media environment with a relatively limited and stable supply of media outlets and content to a high-choice media environment where the proliferation of cable television and the internet has created a plethora of available content. This development is likely to increase the amount of news avoidance, as people can more easily find content that matches their preferences. This means that while people with a high preference for news are more likely to consume even more news, people with a higher preference for other types of content are likely to end up unintentionally avoiding the news, illustrating the interaction between contextual-level and individual-level factors. Focusing on explaining consistent news avoidance, some studies confirm that with the rapid expansion of available media content, an increasing number of people have a consistent low level of news exposure. However, other studies point to more modest increases in news avoidance over time.

More short-term changes in the context, such as an election, a pandemic, or a terrorist attack, also impact the opportunity structure and can have a potential impact on particularly occasional and selective news avoidance. For these more short-term fluctuations, the interaction with variables at the other levels is also important. For example, in election time, news coverage will be more intense, which makes it more difficult to avoid the news. While such intense coverage may lead some avoiders to tune in to the news, it may cause others to tune out due to news overload.

Unanswered Questions and New Research Avenues

While the number of studies on news avoidance is steadily increasing, conceptual unclarities and

divergent analytical approaches call for rigorous thinking to ensure an accumulation of knowledge. To this end, future research will benefit from clearly specifying the type of news avoidance under consideration and carefully consider the complexity of potential underlying causes. The overview of different types of news avoidance and the underlying causes presented in this entry may serve as a useful point of departure.

Future research on news avoidance is faced with challenging questions. In the new, digitized hybrid media environment it is increasingly complex to establish what news is and through which channels and platforms people are exposed to news. Extant research to a high degree relies on self-reported measures of news exposure and often implicitly rely on people's own definition of what news is. Furthermore, people are known to overreport their news consumption in surveys, which could result in an underestimation of news avoidance. Here, a fruitful avenue for future research is more unobtrusive measurements, such as tracking data. Such approaches are, however, also limited by the difficulties of obtaining cross-media measures that can provide holistic accounts of people's news consumption patterns.

These questions speak to the fact that extant research has primarily focused on the factors that can explain why people avoid the news. However, understanding the implications of the different types of news avoidance is crucial for dealing sensibly with people avoiding the news. For instance, if the result of news avoidance is that an increasing number of people characterized by low levels of knowledge and engagement are alienated from democracy, it is essential to mitigate news avoidance. However, if people are able to gain knowledge and get motivated to broadly engage in politics by substituting news with, for example, political satire or updates in their social networks, the implications of news avoidance might not be as bleak as some suggest. Here, the distinction between consistent and occasional news avoidance is also important. While it might even be beneficial for the mental well-being of some people to avoid some of the news some of the time without fundamental ramifications for their political engagement and knowledge, individuals consistently avoiding the news are more likely to end up with low levels of political knowledge and engagement.

Another promising research avenue is to explore how news avoidance can be mitigated. This research is already emerging but also deserves more attention. One strand of research focuses on how to create opportunity structures favorable for inadvertent news exposure in high-choice media environments and shows potential for mitigating unintentional news avoidance. Another strand of research explores if changes in news selection and presentation can reduce the extent of news avoidance. One example is the constructive journalism and solution journalism movements, which aim to counter the negativity bias of news by complementing news coverage with stories that focus on inspirational examples and potential solutions to the problems presented. News media around the world have embarked on experiments that implement this type of journalism in the hope that it will lead to fewer people feeling alienated from the news. Similarly, another emerging trend in the news industry is what has been labelled “slow journalism.” As a response to the accelerating news cycle and overwhelming stream of news updates, this type of journalism emphasize in-depth carefully curated news designed for the audience to escape a feeling of news overload and fatigue.

More research on these endeavors to mitigate news avoidance is needed, and together with additional research on the causes and consequences of news avoidance, such research will provide a more complete picture of when and why people avoid the news, what the effects are, and what can be done about it.

NEWS CONFERENCES

A *news conference*, also known as a *press conference*, is a managed tactic used by organizations and public officials to communicate directly with members of the media. Organizations select one or more individuals to deliver information to invited journalists and usually to answer questions. Presented by politicians and government agencies, law enforcement, businesses, nonprofit organizations, and other newsmakers, news conferences are a strategic forum for the delivery of information that is deemed highly newsworthy, timely, and significant. This entry explains the strategic goals and risks of news conferences for sponsoring organizations, the role of and benefit to participating media, uses of the forum in various historical and contemporary communication scenarios, and event logistics.

A news conference is called when an organization, public official, or other newsmaker has a significant news story to share with the media and, through the media, with the public. The event may be held in a conference room or other suitable setting, with the speaker or speakers usually positioned at the front of the room, often using a podium and microphone, and members of the media assembled as an audience.

A typical news conference is characterized by one or more ranking or expert spokespersons acting on behalf of an organization and an audience of general or specialized journalists representing print, broadcast, or digital news outlets. Because some press conferences are carried live on television, streamed online, or recorded for later use, space may be provided for television cameras, often on a raised platform behind the audience. The sponsoring organization, through its speaker or speakers, will typically present its information and then allow a question-and-answer period to accommodate inquiries from the media. The discursive nature of the news conference is one of its prime characteristics and a reason it may be considered a staple of democratic discourse.

Role of News Conferences in Media Relations Strategy

When sponsored by an organization, policymaker, or other public official, a news conference

is a media relations tactic that fulfills the goal of proactively engaging the media in discourse related to the organization, individual, or agency. Though some news conferences can cover multiple topics, many news conferences are organized around a specific and significant newsworthy story deemed to be of interest to members of the media on behalf of their reading, listening, viewing, or browsing audiences. Organizations and individuals hold news conferences with the hope that the forum will result in media coverage that promotes strategic goals—for example, coverage that increases an organization's or individual's visibility, exposes the public to news and strategic messages, favorably shapes public opinion, generates positive commercial or investor behaviors, or protects organizational or individual reputation.

Because a news conference represents a high level of commitment and risk on the part of the newsmaking individual or organization, and because news conferences demand a high prioritization by participating media outlets, news conferences are typically reserved for the most newsworthy announcements, exhibitions, and situations. Thus while the rising participation numbers at the local soup kitchen may warrant a press release, a riot at or million-dollar donation to that soup kitchen may warrant a news conference. News values such as timeliness, prominence, and significance need to be considered when making this determination.

News conferences also serve the goals of media relations by providing a platform for the delivery of strategic messages related to change. By hosting the news conference, an organization or individual reserves the right to issue a statement or series of statements before members of the media can pose questions. The opportunity to speak first gives the organization an opportunity to carefully and comprehensively articulate its position. In some cases, as in the event of an emerging crisis or an ongoing investigation, the question-and-answer session might be eliminated, leaving the participating media to determine how to handle the information provided.

Many times, the host organization will complement the speech or statement with written, visual, or digital materials that reinforce or contextualize the news. When collected into a digital or physical file and distributed to the media, these materials are called a *press* or *media kit*. The media kit may

include immediately relevant items such as press releases conveying the news story; speech transcripts; selected quotes; relevant data; product samples; multimedia resources, including photographs; and more. The media kit may also contain contextual or background information, such as supplemental press releases; background materials on the organization, issue, or story; biographical information about the speakers; supplemental materials, including fact sheets, reports, and infographics; and so on. These materials may also be provided to the media on an organization's website.

In addition to the dissemination of organizational messages and materials, a news conference also serves corollary reputational and strategic goals. For example, by bringing a news story to the media and thus to the public, particularly when willing to engage in questions and answers, an organization can exhibit a character of transparency. When it willingly engages in questions or answers by the media, the organization also promotes an image that recognizes responsibility to the public's need to know, as well as a sense of accountability to stakeholders and the community. The mutual engagement of an organization with its relevant media partners also fosters relationships that support ongoing strategic communication efforts.

Role of and Benefit to the Media

From the perspective of the participating media outlets, news conferences provide direct and important access to newsmaking organizations, particularly to their leadership and related experts, as well as policy-makers and public officials.

The value of the news conference structure, in contrast to one-way communication to the media via press release, email, or online newsroom, is an opportunity to personally engage with newsmakers to expand and clarify the scope of information available to the public. Journalists prepare for a news conference by studying the sponsoring organization or individual, researching the topics to be presented, and preparing questions in advance. The opportunity to participate in two-way communication in the form of questions and answers gives the media an opportunity not only to clarify or expand information but also to challenge it; to investigate the underlying motivations of

organizations and individuals; to broaden the scope of information available to the public; and to explore consequences and alternative interpretations. Members of the media thus serve as gatekeepers, responsive to the public interest, determining how and how much of the news will be reported, if at all. This follow-up production by journalists is an important stage as they extrapolate and frame information for their readers, viewers, and listeners.

The seating arrangement of reporters may be governed by seniority or protocol, with major media outlets benefitting from assigned, front-row seats at many White House news conferences, while others fill in or find standing room in the back. In other scenarios, the press may assemble in order of arrival or proximity, especially in the case of an impromptu or nontraditional news conference. Question-and-answer sessions, generally, are directed by the primary spokesperson, who may call on reporters in order of personal preference and determine the end of the session. Journalists may also take advantage of the forum to pose questions related to current events or other, unrelated topics. Reporters often stack their questions and provide follow-up queries. Members of the media attend the news conference with the expectation that their questions will be answered; however, a spokesperson may choose whether or not to answer a question, to do so partially or completely, or to dodge or object.

Strategic Applications of the News Conference Formula

News conferences are a preferred tactic for many disparate organizations, industries, and individuals who adapt format, style, and logistics to meet strategic goals.

Law Enforcement and Public Safety

Law enforcement and public safety officials use news conferences to provide timely and crucial information of concern to the public. Examples may include providing a summary of a recent crime or event; eliciting public support or issuing warnings in the event of a manhunt or natural disaster; and giving an update on an ongoing investigation or unfolding situation. These news conferences can include statements by experts,

victims, or other relevant individuals. Among many notable examples in this category were the daily or twice-daily news conferences held by New York City Mayor Rudolph Giuliani following the terrorist attacks of September 11, 2001.

Public Health Emergencies

In the event of a public health emergency such as the spread of COVID-19 in the United States beginning in 2020, news conferences can be an effective tool for government, health care, and related officials to convey urgent news or advice to the public. The White House, U.S. Centers for Disease Control and Prevention, the World Health Organization, hospitals, governors, mayors, global leaders, and even celebrities were among those holding news conferences related to the crisis.

Candidates and Elected Officials

Because of the high news value of elections and political controversies, particularly at the state and national levels, political candidates and elected officials hold news conferences regularly and aggressively to build public recognition, articulate policy positions, and engage constituencies. Arguably those who employ the news conference tactic most frequently, candidates and elected officials use both traditional and nontraditional settings for their news conferences. Nontraditional settings can help shape a candidate's character or highlight a main campaign message, as when a candidate discusses labor policy at a Detroit manufacturing facility or environmental policy at a national park.

Joint News Conferences

Unlike a news conference that includes multiple speakers, experts, or stakeholders, a joint news conference typically denotes an event featuring two or more high-ranking political figures from different countries. According to the White House Historical Association, President George H. W. Bush was the first U.S. president to implement this type of news conference. A joint news conference highlights the diplomatic relationship of the individuals and perhaps offers commentary on the issues under discussion. Typically, journalists from

both countries may participate, with translators on hand when needed to facilitate conversation between the political leaders or between the spokespersons and the media. Although the goal of the joint news conference may be to highlight the collaborative or productive relationship of the leaders on behalf of their nations, questions can deviate from those topics into other current events.

Publicly Traded Companies

Publicly traded companies host news conferences to engage the financial media at various stages of the business cycle, including the initial public offering, the issuance of quarterly and annual earnings reports, announcements concerning corporate leadership, and more. News conferences can also deliver important news related to corporate performance, as when a company fails to generate or exceeds its expected quarterly revenue, or news related to new technologies or initiatives, as when a company introduces a new product or launches a charitable campaign. In times of crisis, a news conference can provide a venue for acknowledging and responding to concerns of investors or the public.

Nonprofit and Advocacy Organizations

Nonprofit and advocacy organizations can use news conferences for substantial news stories and announcements, or in tandem with other tactics, to move public opinion on important issues. Rallies, demonstrations, and public gatherings can provide a lively or compelling backdrop for a news conference on a controversial issue or policy question. Strategic positioning of a news conference—at a garbage dump, art exhibit, or the national border, for example—can prompt members of the media to complement verbal reporting with relevant sounds and images that strengthen the organization's message.

Sports

Sports leagues, teams, and athletes use news conferences regularly to generate attention and enthusiasm among the sports media and, through them, their fans. News conferences can be used as a tool for pre-event publicity, as when boxers

famously erupt in pre-title-fight press conference brawls. They are also used to generate off-season interest, as in college sports media days, which hype incoming recruits. News conferences can also bookend sporting events, as with pretournament press conferences by top Ladies Professional Golf Association contenders or postgame National Football League press conferences, at which coaches break down the winning (or losing) play or star players provide sound bites on an inspiring (or second-rate) performance.

Risk

While a news conference has the potential to deliver significant advantages to the sponsoring organization or individual in terms of visibility, message delivery, or crisis management, a news conference also presents a level of risk to the organization. These risks may come about due to the exposure of the organization or its representatives; the possibility for mistakes on the part of the spokesperson or communication staff preparing the remarks; the variable and often unpredictable stance of the media; the possibility that the organization's position or statements may be misrepresented or misinterpreted; and the volatility of a question-and-answer session, particularly in a high-stakes or controversial situation. In reality, a news conference does not guarantee favorable coverage or any coverage at all and may result in damage to the organization, individual, or cause.

Organizations may take informed steps to mitigate these risks. Strategies to manage risk may include carefully scripted and rehearsed statements or speeches, recognizing that impromptu remarks or nervous spokespeople may result in misstatements; invitation of journalists considered friendly to the organization or issue; prepared answers to anticipated questions; elimination of the question-and-answer session, despite the subsequent risk to perceived organizational transparency; and participation of experts, partners, or public figures to provide added credibility and visible evidence of support. At times, particularly in times of crisis, the risk of failing to communicate will outweigh any risks inherent in the news conference setting.

Planning and Logistics

Once an organization, policy-maker, or public official determines that a news conference is in order, those responsible for strategic communication will determine the scope of the topic, identify desired media participants, and clarify timeline. The preparation phase may be as short as minutes or hours, as in the event of a crisis, or as long as weeks or months, as in the planning of a collegiate media day or product launch. The event will be announced by means of a media advisory or alert and often supplemented with follow-up phone calls or emails to highly desired participants.

Logistical preparation centers on the identification of a location that is convenient for the sponsoring organization or official as well as the media to bolster participation; however, the site may be selected with an eye toward effective contextualization of the news. The White House, for example, holds regular news conferences in the James S. Brady Press Briefing Room, but other presidential news conferences have been held in the Rose Garden, at national parks, on military bases, and elsewhere. Similarly, businesses and nonprofit organizations can choose traditional or nontraditional settings such as a convention center, assembly plant, service facility, or even public outdoor space. Public officials, including law enforcement, may select a formal setting or, conversely, the scene of an accident or public event. No matter where the news conference is held, planners must consider access and security, the appearance and visibility of speakers, the number and position of assembled media, Americans with Disabilities Act compliance protocols, and the position of cameras and recording equipment.

Strategic preparation for the news conference by the host organization includes development of tactical messages by the communication staff; selection and schedule of speakers and their remarks; preparation of the main statement as well as answers to likely questions from the media; and production of supplementary resources such as multimedia, materials for distribution to journalists and other attendees, and web-based or social media distribution strategies. When time permits, and particularly in the event that a news conference will engage complicated issues of policy or elicit deep scrutiny from the media or the public,

speakers may engage in a period of rehearsals for their main content delivery as well as question-and-answer sessions.

White House Origins of the News Conference

For centuries, the press has been seen as a collaborator with public officials in the implementation of public policy and in shaping public opinion. However, as the press moved away from single-minded political affiliations of the early-to-mid 19th century and into an era in which circulation and advertising drove revenue—and thus content—lawmakers found it imperative to engage the media in new ways. Following the Civil War, President Andrew Johnson agreed to interviews by members of the press. By the 1880s, reporters were stationed outside presidential candidate James A. Garfield's Mentor, Ohio, home to hear comments from his front porch. And as the new century dawned, Theodore Roosevelt, thrust suddenly into the presidency by the assassination of President William McKinley, invited reporters to the Oval Office for regular and often candid statements and discussions.

News conferences evolved during the 20th century as an intentional and structured way for the president to deliver news to members of the media. President Woodrow Wilson is credited with holding the first presidential press conference on March 15, 1913. The event was held in the Oval Office with Wilson, standing behind his desk, and more than 100 reporters. Early press conferences were intended to be “off the record,” according to the White House Historical Association, so that presidents could have an opportunity to modify or retract their statements before being reported by the press.

Subsequent presidents continued the tradition, and the role of the press was quickly formalized, with the White House Correspondents' Association formed in 1914. Nevertheless, early White House press conferences displayed qualities that continue to characterize news conferences: careful statements with an eye toward public dissemination, members of the media eager for a scoop, a spokesperson sometimes unwilling to answer a question—or unwilling, at least, to give the answer

the press desired. The press was addressed in the Oval Office as late as the Roosevelt administration. Notably, First Lady Eleanor Roosevelt was the first presidential spouse to call her own press conference on March 6, 1933. Eleanor Roosevelt would go on to host hundreds of press conferences, with most restricted to women reporters. Beginning with the Truman administration, presidential news conferences would be held in other locations to accommodate growing numbers of reporters. Since 1970, White House news conferences have been held in the James S. Brady Press Briefing Room, atop the former White House swimming pool, as well as other locations.

Technology has impacted the delivery of press conferences and their reach, with recording by radio, television, and newspaper equipment first permitted under President Dwight D. Eisenhower, beginning in 1955. President John F. Kennedy was the first to deliver a live televised press conference, in 1961, and capitalized on his personal charisma to build a rapport with reporters as well as viewers at home.

In the modern era, news conferences by organizations, politicians, and other public figures can be livestreamed to global audiences via web and social media platforms. Online news conferences offer several advantages, including broader geographical distribution of participating media, smooth interface with websites and social media audiences, easy integration of multimedia content, cost-effective administration, text or voice-delivered questions, and archiving functions so the news conference can be viewed at a journalist's convenience.

NEWS CORPORATION

News Corporation was an international media conglomerate originating in Australia but headquartered in New York City. Incorporated by Rupert Murdoch in 1979 as a holding company for his Adelaide, Australia-based News Limited, it would become the mogul's primary vehicle in a decades-long global campaign of media acquisitions and start-ups. While not the largest or highest earning media company of its time, News Corp. attracted sustained critical scrutiny as the epitome of broader trends toward consolidation and globalization within the media industry.

By the early 21st century, News Corp.'s news and entertainment holdings reached a larger percentage of the world's population than those of

any of its competitors. The firm's close association with the Murdoch family—whose patriarch is renowned for his conservative politics, tabloid journalism, aggressive business stylings, and for circumnavigating tax and media regulatory regimes in multiple countries—made it the subject of regular controversy. In 2013, "News Corp" rebranded and spun off the bulk of its entertainment and television holdings—creating a separately traded 21st Century Fox, which was acquired in 2019 by the Walt Disney Corporation. The restructured News Corp has slimmed down considerably, but maintains global influence, particularly in book publishing, news production and aggregation.

This entry first discusses the origins of News Corp. before looking at the company's expansion into the United States and eventual global dominance. It then looks at the roles of Murdoch family members in the company and the effects of the phone-hacking scandal at its *News of the World* tabloid newspaper and the sexual harassment scandal at its Fox News Channel and the firm's subsequent fragmentation.

News Limited

News Corporation's predecessor, News Limited, was founded in 1923 by journalist James Edward Davidson as a holding company for newspapers in Western and Southern Australia. It was acquired in the late 1940s by Sir Keith Murdoch, who upon his death in 1952 bequeathed it to his son Rupert. Rupert Murdoch took the reins of News Ltd. in 1953, upon completing his degree at the University of Oxford and working as a subeditor for London's infamously sensationalist and conservative tabloid the *Daily Express*. In its first decade under Murdoch's leadership, News Ltd. experienced rapid expansion—growing from a single holding, the 75,000-circulation Adelaide *News*, into an insurgent force in Australia's media system. Murdoch first targeted newspapers in the country's more far flung cities and towns, perfecting a populist tabloid style and honing a reputation for cutthroat business practices, before launching an advance upon Sydney, the country's commercial hub. Murdoch engaged in subterfuge and leveraged his fledgling global television connections to break into the Sydney market,

ultimately purchasing the tabloid *Daily Mirror* and effectively breaking the duopoly of the Fairfax and Packer families. News Ltd. solidified its national dominance in 1964, when it launched *The Australian*, Australia's first national daily newspaper.

News Ltd. first began its international expansion in the early 1960s, with acquisitions in Hong Kong and New Zealand, but made its first global waves in the United Kingdom with its purchase of the *News of the World* and *Sun* newspapers in 1969. Throughout the 1970s, News Ltd. distinguished itself by producing among the most prurient, reactionary, and profitable tabloids of London's infamous Fleet Street.

News Ltd. papers championed conservative Margaret Thatcher's rise to power, which she reciprocated by exempting from the United Kingdom's monopoly assessment procedures the company's 1981 purchase of London Times Newspaper Ltd. (adding a more reputable broadsheet to the company's portfolio and securing some 30% of the UK national newspaper market). Meanwhile, the 1970s also saw News Ltd. take its first steps into the United States. Following a similar strategy to its expansions in Australia and the United Kingdom—purchasing under-valued and unprofitable newspapers, dialing up the sensationalism and dialing down the cultural sensibilities—News Ltd. initially faced headwinds in the U.S. print market. Its San Antonio, Texas newspapers, the *Express* and *News*, achieved moderate profitability, but the *National Star* (a supermarket tabloid founded in 1974 to rival the *National Enquirer*), the *New York Post* (purchased in 1976), *Boston Herald* (1982), and *Chicago Sun-Times* (1984) all underperformed in their respective markets.

Incorporation and U.S. Growth

Shortly after incorporating, and relocating the headquarters of Murdoch's media empire to New York City, News Corporation began a series of targeted investments and acquisitions that would profoundly reorient the U.S. film and television industries. After initial investments in Warner Bros., skirting Federal Communications Commission regulations against cross-ownership of newspapers and television stations in metropolitan areas, in 1985 News Corp. purchased the

Hollywood film studio 20th Century Fox and the Metromedia TV stations, which would combine to serve as the basis for Fox Broadcasting Company in 1986.

Before Fox, the United States television market had long been dominated by three networks, colloquially known as the "Big Three" (NBC, CBS, ABC). These three networks produced entertainment and news content to be syndicated by local affiliated stations around the country. The Big Three had each emerged, in their own ways, out of previously established radio networks—their national scale made the prospect of building a "fourth network" seem a daunting, even impossible feat. Nevertheless, through its ownership of studios and stations, Fox was able to leverage economies of scale to become the first new U.S. television network since 1948. Extending its print strategy into broadcast, News Corp. relied upon tried and true tabloid tactics to draw attention to the upstart Fox network.

Fox was an innovator of cheaply produced, scandal-driven infotainment (e.g. *A Current Affair*), true crime programming (e.g. *COPS*, *America's Most Wanted*), and, later, edgy reality television (e.g. *Who Wants to Marry A Millionaire?*). Fox's early rise also benefitted from News Corp.'s 1988 purchase of Triangle Publications—a \$3 billion debt-financed deal that made the conglomerate the largest magazine publisher in the United States by circulation. That acquisition included the 17-million-circulation *TV Guide*, which News Corp. used to promote fledgling Fox programming lineups.

News Corp.'s successful entry into the U.S. broadcast market came at a steep cost—almost entirely financed by short-term debt. The early 1990s saw a string of near-death experiences for News Corp., as it struggled to pay off and reschedule its obligations to well over 100 creditors around the world. News Corp. ultimately avoided bankruptcy largely due to its own byzantine and convoluted ownership structure, designed by Murdoch to prevent bank takeover. A debt override agreement was secured by 1991, but News Corp. continued to struggle with regulators and tax authorities in several countries throughout the decade. In the United States, News Corp. survived its last major regulatory challenge in 1995, when the Federal Communications Commission invited

the company to apply for a public interest waiver, absolving the company of its decade-long violation of U.S. restrictions on foreign media ownership.

The 1990s also saw News Corp. expand into the U.S. cable television market—first with the light-entertainment channel FX, which launched with 18 million subscribers in 1994. The channel struggled to build its subscriber base, failing to break into the lucrative New York City market due to gatekeeping by Time Warner, the cable company owned by media mogul Ted Turner. Two years later, News Corp. would escalate its battle with Time Warner—launching Fox News Channel in 1996 to rival Turner's long-dominant Cable News Network. Fox News, like many News Corp. properties, started off as an underdog. It poached former Republican Party communication strategist and successful television producer Roger Ailes from America's Talking, the NBC-affiliated predecessor to MSNBC. But it again struggled to build a subscriber base.

Despite offering cable providers \$11 per subscriber (a nearly 10-fold higher price than the next highest carriage offer), News Corp. again faced headwinds from Time Warner, launching Fox News with only 18 million subscribers. Fox News struggled in its early years, even as it honed its right-wing populist style covering the Bill Clinton impeachment hearings. The channel's breakthrough moment was its coverage of the September 11, 2001 terrorist attacks and their aftermath. By January 2002, Fox News had usurped Cable News Network as the top-rated cable news channel in the United States—a position it has mostly maintained ever since. News Corp. extended its dominance of U.S. conservative media in 2007, when it took ownership of the esteemed *Wall Street Journal*, as part of its acquisition of the financial information and publishing firm Dow Jones.

By the turn of the 21st century, News Corp. had firmly established itself as a fixture of the U.S. cable and broadcast television markets—its Fox affiliates broadcast programming to most local markets, while it dominated or contended for dominance of news (Fox News), sports (Fox Sports), and business (Fox Business) programming. Its print holdings exerted outsized political and pop cultural influence, as well. The company's

innovations in conservative news, in particular, played a significant supporting role in polarizing the country's political parties and discourse.

Global Dominance

While News Corp. was founded in part to give Rupert Murdoch a U.S. base of operations, the scope and scale of the company's acquisitions strategy was always global. The 1980s saw News Corp. purchase a majority share in Hong Kong's *South China Morning Post* and Murdoch's father's former paper, the Melbourne *Herald*, in Australia. News Corp. also purchased the New York book publisher Harper and Row, which it merged with the British publisher William Collins to create one of the largest English-language book publishers in the world (HarperCollins).

News Corp. was also an early adopter of satellite television, which it saw as a means to circumvent the established terrestrial and cable television monopolies in various countries. In the late 1980s, after failing to win regulatory approval to launch a satellite service in the United Kingdom, and a failed bid to be part of the British Satellite Broadcasting consortium, News Corp. launched a four-channel pan-European satellite network called *Sky Television*. It beat British Satellite Broadcasting to the air by 6 months and in late 1990, with both companies sustaining heavy losses, the two merged to create BSkyB. The venture was an early money loser for News Corp., but in the coming decades, it would expand its satellite services around the globe to more profitable effect—leveraging its vertically integrated distribution system to reach tens of millions of households across Europe, Asia, Australia, the Middle East, and Latin America by the early 2000s. By 2004, News Corp. had acquired DirecTV, securing the second largest subscription-based television provider in the United States—further eroding the dominance of traditional cable providers, like the company's U.S. rival Time Warner.

If News Corp. excelled at producing and distributing content in the print and visual mediums, thriving in markets around the globe, it had more mixed results in its digital media acquisitions. Its purchase of the early social networking site MySpace in 2005 was a flop, and the company sold the site, now styled as Myspace, in 2011.

News Corp has continued to invest in artificial and social media intelligence, however. In 2013, it acquired and expanded Storyful, and its 2020 launch of the artificial-intelligence driven news aggregator site Knewz reflected the company's continued interest in the latest technological innovations.

A Family Affair

Since the beginning, when Rupert Murdoch inherited the Adelaide *News* from his late father Sir Keith, News Corp., and its predecessor News Ltd., have been almost synonymous with the Murdoch clan. True to form, virtually every significant stage of the conglomerate's growth has corresponded with a new marital partner for Rupert. He met his first wife, Patricia Booker, while in his early years of leading News Ltd. in Adelaide. The couple had one daughter, Prudence, born in 1958 while Murdoch was in the early stages of building News Ltd. into a dominant player in Australia. Murdoch met Anna Torv, his second and longest marital partner, while she was an entry-level reporter at News Ltd.'s Sydney *Daily Mirror*. They married in 1967, as Murdoch was leading the early stages of News Ltd.'s overseas expansion. Their marriage lasted until 1999, and yielded three children: Elizabeth (born 1968), Lachlan (born 1971), and James (born 1972). Wendi Deng was an up-and-coming executive at News Corp.'s Hong Kong-based subsidiary Star TV when she met Murdoch in the late 1990s. The two married in 1999, as News Corp. was in the midst of global expansion and shortly after Murdoch's divorce with Torv was finalized. They had two children, Grace (born 2001) and Chloe (born 2003), before divorcing in 2013. Murdoch married his fourth wife, American actress Jerry Hall, in 2016, about a year and a half before Murdoch began the process of selling the bulk of his global entertainment properties.

The four children from Murdoch's first two marriages have each played various roles in News Corporation over the years. Prudence has served in various directorial roles with News Corp. and its subsidiaries, while Elizabeth founded the UK-based television production and distribution company Shine Group, later purchased by News Corp. Murdoch's sons, Lachlan and James, have both held

multiple executive roles with News Corp. and its subsidiaries. In keeping with the patriarchal spirit bestowed by Sir Keith, Murdoch's sons have, respectively, been variously rumored as likely successors to their father's News Corp. chairmanship.

Scandal and Decline

The first decade of the 21st century saw News Corp. at the height of its global power, but also the first hints of scandals that would soon perpetuate its fragmentation. As early as 2004, rumors of sexual harassment at Fox News Channel swirled amidst reports of lawsuits and multi-million-dollar settlements by then top-rated Fox personality Bill O'Reilly. In 2006, the *News of the World* itself became news in the United Kingdom when reports surfaced that its reporters had hacked the phones of celebrities in pursuit of tabloid scoops. At the time, these scandals seemed minor blows to News Corp.'s overall reputation, hardly making a dent in terms of the company's massive bottom line. Both would prove emblematic of deeper management issues within the conglomerate, and harbingers of its decline.

In 2011, it was revealed that the *News of the World*, in addition to hacking celebrities, had hacked the phones of deceased British soldiers, of terrorist attack victims, and of the murdered schoolgirl Milly Dowler. The ensuing public and political backlash, not to mention criminal investigations, came at an especially inopportune time for News Corp., which was in the midst of an effort to obtain full ownership of BSkyB. Long a dominant player in the United Kingdom's national newspaper market, and already a controlling minority shareholder in BSkyB, the bid would have given News Corp. full control of the United Kingdom's largest pay television broadcaster. In an effort to save the deal, News Corp. abruptly shuttered the *News of the World* and engaged in a series of top-tier management shakeups. Both Rupert and James Murdoch resigned their posts in News International, the News Corp. subsidiary that controlled its British newspaper holdings, and James also stepped down as BSkyB chairman. While James Murdoch would resume as chair of BSkyB in 2014, the scandal effectively halted News Corp.'s long battle for total control of the television network.

Meanwhile, a leadership crisis was also brewing at the Murdochs' U.S. flagship property, Fox News Channel. By 2016, longstanding rumors of an entrenched climate of sexual harassment and intimidation at Fox came to a head when former anchor Gretchen Carlson filed a lawsuit against the Fox president Roger Ailes. The lawsuit inspired other former Fox employees to come forward with allegations, forcing Ailes to resign. Murdoch assumed the Fox News chairmanship as Donald J. Trump was accepting the Republican nomination for president. Under Murdoch's leadership, the channel faced intensified criticism for its apparent revolving door with and fawning coverage of the Trump administration.

The following year, the Murdochs began scaling back their global media empire. The family had split News Corporation into two separately traded companies in 2013—"News Corp," comprised of the original firm's print news and publishing assets, and 21st Century Fox, which retained the original firm's entertainment-oriented and other television media properties. In 2017, the Murdoch-controlled 21st Century Fox entered into negotiations with the Walt Disney Corporation, prompting a bidding war with Comcast. Ultimately, Disney paid \$71.3 billion to acquire the 21st Century Fox film and television studios, including what were formerly News Corp.'s entertainment-oriented cable and satellite channels, among other assets. In 2019, the remaining television properties, including the Fox Broadcasting Company, Fox News, Fox Business, and Fox Sports, spun off into a new Murdoch family-controlled public company called *Fox Corporation*, with Lachlan Murdoch at the helm. Rupert Murdoch, meanwhile, retained the chairmanship of the reborn News Corp, which maintained the bulk of the mogul's global newspaper, magazine, and book publishing assets.

NEWS DESERTS

News deserts is a term used in both scholarly publications and the popular press to describe geographic regions or communities that lack access to critical information on quality-of-life issues, such as education, governance, politics, and the environment. The University of North Carolina Hussman School of Journalism and Media defines a news desert as a "community, either rural or urban, with limited access to the sort of credible and comprehensive news and information that feeds democracy at the grassroots level" (U.S. News Deserts, n.d.). Other researchers define news deserts as geographic communities that lack a local news outlet, or a group of people sharing similar characteristics and backgrounds, such as immigrant communities, that lack adequate coverage by mainstream media.

Much scholarly research on news deserts has focused on a recent dramatic decline in the number of mainstream newspapers because newspapers have historically been the prime source of locally relevant news and information for many residents outside of major media markets. Thousands of communities in the United States—including rural villages as well as inner city neighborhoods and suburban towns—have lost local newspapers and are at risk of becoming news deserts. Other countries with vast land mass, including Canada and Australia, as well as mature democracies in Europe, Asia, and Latin America, have experienced a decline in local newspapers and local journalism. This entry traces the origin and evolution of the term news deserts, the reasons that news deserts emerge, the implications of news deserts, and potential solutions to the problem.

Origin and Evolution of Meaning

The term *news deserts* is of recent vintage, used first in government publications and the popular press to describe the loss of hundreds of local daily and weekly newspapers in the first decade of the 21st century. A 2011 report by the Federal Communications Commission, *The Information Needs of Communities*, introduced the concept, noting that many communities faced a shortage of local, professional reporting, which would most likely lead to government waste, corruption, less effective schools, and other problems in the community. In the same year, a Chicago journalist and community activist described a “communications desert” as a community in which vital information did not reach its residents. Others noted the emergence of a “digital divide,” in which many communities lacked access to reliable broadband access. As a result, the residents lived in “media deserts,” with only limited news and entertainment options. By the middle of the second decade of the 21st century, many scholars and media outlets had focused the framing around the emergence of news deserts, a concept similar to “food deserts,” which are geographic areas where residents lack access to fresh, affordable food. Similar to the need for food, communities require up-to-date, credible news so residents can fully participate in society and make informed and educated decisions.

As of 2020, research on the growing challenge of news deserts has focused much of its attention on communities without a local newspaper or with significantly diminished newspapers because newspapers are the dominant producer of original news content that is often picked up by other local media, including television and radio. Scholars have estimated that as much as 85% of the news in a typical day in the United States originates with journalism produced by a local newspaper. More comprehensive methods to measure local news production are emerging, making it possible to analyze the broader local media ecosystem or media ecology. Regardless of the particular mediums inferred by the term, areas with a dearth of access to important local news leave communities and their residents malnourished.

Between 2004 and 2019, the United States lost a fourth of its newspapers—more than 2,000 weeklies or nondaily publications, and at least 70 dailies. By 2018, at least 1,800 communities were classified as news deserts, lacking a local news outlet. Between 2008 and 2018, the country lost half of all newspaper journalists when thousands of weekly papers closed and multiple rounds of layoffs caused the remaining regional papers to significantly scale back coverage of state and local news. Hundreds of newspapers shed journalists and scaled back local news coverage so significantly that they became known as *ghost newspapers*—shells of their former selves.

Residents of U.S. communities in the South and Midwest are most likely to live in a news desert. Most of the newspaper closures have occurred in economically struggling communities with high poverty rates, where residents have limited access to print, broadcast, or digital information. However, urban, well-educated communities are not immune.

Early predictions that digital news organizations would make up the deficit have not materialized. Even though the digital journalism segment has experienced limited growth, it has not been able to make up for the loss of reporting on everything from routine government meetings to investigative and analytical reporting on topics such as education, politics, the environment, and business. Of the more than 500 local digital sites that had been established by 2019, 90% were located in metro areas that already had several media

options. Most of these digital outlets had only a handful of journalists and limited financial resources.

How News Deserts Emerge

The decline in local newspapers has been driven by two trends. One is a change in habits and preference, as both readers and advertisers switch from print publications to digital alternatives. Also, the economic model that supported local print newspapers in the 20th century has collapsed, and the industry has failed to replace lost print advertising and subscriber revenue with digital profits. Retail and classified print advertising traditionally furnished the vast majority of revenue and almost all the profits of most local newspapers. Between 2000 and 2010, print newspaper advertising in the United States fell below 1950 levels and has continued to fall in the second decade. Simultaneously, audiences began searching online for news and information.

Beginning in 2011, more Americans accessed their news online than by reading a print newspaper. Because most local newspapers did not charge online viewers to access news and information on their websites in the first decade of the 21st century, consumers began expecting to receive their digital news for free. By 2014, newspaper subscription revenues weakened by more than \$23 million as consumers questioned the need to pay for news content. These factors have contributed to public reliance on social media and partisan digital sites as a source of news, raising potential exposure to misinformation, propaganda, and conspiracy theories—especially at the national level, and increasingly at the local level, as well.

Advertisers follow consumers, so instead of migrating their print ads to newspaper digital sites, the vast majority of local advertisers moved to online platforms promising to reach hyper-targeted audiences at less expense and through innovative marketing solutions such as native advertising. By 2019, Google, Facebook, and Amazon garnered 70% of the \$130 billion online advertising market, leaving all news media—including television and digital start-ups—to fight over the remaining 30%.

As a result, media ownership in the United States looks radically different than it did in 2000.

In the wake of the 2008–2009 recession, many newspapers—family businesses, as well as large chains—were forced to file for bankruptcy. Many of these newspapers were snapped up by a new type of owner: private equity firms and hedge funds that specialize in purchasing distressed businesses. The drive of these newcomers to maximize profits often conflicts with traditional values of journalism and its civic mission.

Consolidation in the industry, weaker commitments to the civic mission of journalism, and the drive to maximize profits have paved the way for massive newsroom layoffs, a reduction in the production and quality of local news, and the sale or closure of newspapers that do not meet financial projections. News deserts emerged as a consequence of this shift in ownership, the dramatic loss of print advertising revenue, and an inability to compensate by generating digital revenue. Many surviving newspapers, which operated at double-digital profit margins at the beginning of the century, clung to low single-digit margins by 2020.

Implications of News Deserts

Economists consider local news a public good because an entire community benefits when its residents have access to news and information that helps them make informed decisions about important issues. Abundant scholarly research in several countries has shown that strong local journalism builds social cohesion, encourages political participation, and improves the efficiency of decision-making of both local and state governments. The 2011 Federal Communications Commission report identified eight areas of information deemed critical for daily life and for communities to thrive: economic opportunities, education, emergencies and risks, the environment, civic information, health and welfare, political information, and transportation. In 2019, in spite of the segment's significant job losses, surviving newspapers still produced a larger percentage of original local news about important topics in civic life than all other mediums combined.

Local news organizations, particularly newspapers, contribute to the overall health of their communities. The rise of news deserts raises concerns about the transparency and accountability of local

government and business. Absent any news media to perform investigative journalism and assume the institution's historic watchdog function, there is no mechanism to hold those in power accountable. Studies have shown that political partisanship is correlated with distrust of the media and perceptions of media bias. Although public trust in news organizations has remained higher for local news than national news, overall trust of the media has experienced declines for years.

There have been various attempts to fill the local information void, including the hiring of more journalists by public broadcasting outlets, the establishment of digital outlets, and nonprofit funding of both legacy and start-up news organizations. Yet, studies have found that surviving newspapers still produce more locally relevant news and information than all other mediums combined, including local television, radio, and digital outlets. Therefore, the loss of a local newspaper—and the subsequent diminishment in readily available local news and information—has significant political, social, and economic implications for the long-term health of individual communities, as well as for society and democracy in general.

Potential Solutions

Reviving local news will require a reconceptualization of the building blocks of journalism, leaving start-up and legacy news operations to reach for new models—for-profit, nonprofit, and even publicly funded options common in many European and British Commonwealth countries. Some experts suggest a broader focus on “media deserts” to measure the entire community information ecology including news, information, and public conversation in an effort to map the complex communication systems at work in communities. Increasingly, community activists, legislators, and others are looking to address the issue of news deserts with governmental policies at the national, state, and local levels.

Many universities, advocacy organizations, and nonprofit foundations have created centers or programs to track industry changes, engage with industry, and collaborate to identify potential business solutions and product innovations. Policy recommendations include government subsidies,

taxation and licensing fees, and antitrust legislation aimed at curbing the market dominance of the tech giants such as Google and Facebook. Alternatives to government intervention include increased investment by venture capitalists, nonprofit organizations and community foundations, public/private partnerships, and private philanthropists. Regardless of the interventions proposed, successful solutions must address the unique market economics and information needs of a particular community.

NEWS DIFFUSION

News diffusion is the process by which information about people, events, and trends flows through society. The systematic study of news diffusion began in 1945 when Delbert Miller investigated news flow about President Franklin Roosevelt's death. His findings launched the theoretical study of news diffusion. Miller found that after initial exposure to the information via the radio, word of mouth was the primary means in which the information spread; thus, the majority of people found out about Roosevelt's death via personal contact.

Research of news diffusion has tended to spike during periods marked by significant news stories. For example, a 2003 study found that 97% of Americans knew about the destruction of the World Trade Center on September 11, 2001, within 3 hours of the attack. This entry discusses the research on news diffusion, including patterns of news diffusion and the development of news diffusion theories. It then looks at more recent trends in news diffusion with the advent of social media and other technologies.

Several academic disciplines study news and information diffusion. While a majority of the research is found in mass communication literature, sociologists and scholars specializing in public opinion have also paid a good deal of attention to news flow. News diffusion theory naturally lends itself to strategically thinking about how to diffuse messages and create information salience within social circles. As a result, news diffusion theories are important not just to journalists, but to other information managers such as advertisers, political consultants, and educators.

The tangled web of information flow has grown more complicated with the advent of the

Internet and social media. A Pew study found that more than half of all U.S. adults (55%) in 2019 got their news from social media, up from 47% in 2018. Those figures, combined with declining readership of newspapers and viewership of television news, indicate that news consumers are looking elsewhere for information, which is changing, to some degree, how content diffuses through society.

Thanks to mobile devices, customized social media feeds and the democratization of content that makes anyone a publisher, news consumption is increasingly an individualized experience. Scholars have found that the ways and reasons people get news are constantly evolving, and research has emphasized shifting patterns of news consumption, the uses of mobile devices and social media networks, differences across countries and cultures, willingness to pay for content, and perceptions of trust.

Patterns of News Diffusion

Typically, patterns of news diffusion are represented using schematic drawings. An S-curve is most often associated with diffusion and represents an initial small spike that dips then surges again as information about a news event spreads. Scholars have also tried to identify other news diffusion patterns. For example, the J-curve suggests that when an event is of high interest, the news reaches a few individuals who then diffuse it rapidly through interpersonal channels.

Other patterns of news diffusion have been introduced over the years. The importance of interpersonal communication in news diffusion theory has aligned the study of news flow to the work of sociologists Paul Lazarsfeld and Elihu Katz in 1955. Their two-step flow model of communication speculated that mass media's reach is extended by opinion leaders, typically people who have the most access to media and who have a strong understanding of media content. Communications researcher Stephen Chaffee suggested in 1975 that news information diffusion had three distinct patterns or types. One is incomplete diffusion, when a story fails to work its way across the audience. The two other patterns are fast-moving news and very slow-moving diffusion.

Development of News Diffusion Theories

The 1960s saw a number of news diffusion research studies surrounding major news events, such as the assassinations of President John F. Kennedy in 1963 and Martin Luther King Jr. 5 years later. These studies affirmed that the more human interest in the event, the more likely it was that interpersonal communication would assist the media and cause the rapid diffusion of news. Communications researcher Bradley Greenberg found in 1964 that within an hour of Kennedy's assassination, 92% of Americans knew of the event. Furthermore, he found that how that information was diffused was most often impacted by whether a person worked and when the event happened. If the event happened during the work week (Kennedy was shot at midday on a Friday), employed people were most likely to find out about the story from a colleague. If the event happened over the weekend, the mass media were primarily responsible for diffusing the story.

During the 1980s, scholars furthered news diffusion research by examining how demographics and political affiliations related to the process. Researchers examining the attempted assassination of President Ronald Reagan in early 1981 once again found that interpersonal communication was the primary means most of those studied had found out about the shooting. Further examination found that demographics did not impact the first awareness of the news event, but did impact how an aware person would diffuse the information. Younger persons were more likely to tell someone else what had happened, and men and young people were more likely than women or older people to turn on the television to learn.

Communications researcher Melvin DeFleur (1987) conducted a meta-analysis of news diffusion research and found a lack of systematic study on the news flow process and as a result very little research aimed at theory building. DeFleur also found that frequently studies of news diffusion relied on accidental rather than random sampling, which limited reported results to little more than anecdotal value. He also argued that one could not apply the principles of technological diffusion (the study of how and why people adopt new technologies, a focus of much research attention

since the 1980s) to the study of that news and information diffusion. DeFleur argued that news diffusion was a less rational process than deciding to adopt a new gadget and therefore the same driving concepts were not always at play.

A handful of studies have explored why people tell others of news events. Telecommunications researcher Walter Gantz and his colleagues found in 1976 that people are compelled to insert themselves in the news diffusion process based on four needs: to establish social status, to satisfy informational and interest needs, to express one's emotions, and to initiate social contact with others. Their study did not focus on a particular news event, but rather on news in general. Sharing is often related to social and relational motivations as much as informational ones. Sharers want a reward of some kind, be it recognition and/or responses. But they also share with the characteristic of their audience in mind. A word-of-mouth study (2009) about how information was shared about films found that consumers transmitted details only when they felt it appropriate for their audience. In other words, an audience's "fit" for the content matters as much as the content itself.

More Recent Trends and Social Media

News events, such as the 9/11 attacks Hurricane Katrina in 2005, renewed interest in news diffusion research. Even with the ubiquitous nature of media today, a majority of Americans interviewed on September 12, 2001, just a day following the attack on the World Trade Center and the Pentagon, reported first hearing about the event from someone else (50%) rather than from the mass media (39%). The Internet's momentum as a news delivery source also led researchers to wonder what role the web played in disseminating news about the 9/11 attacks. Researchers found that most people went to the web in search of additional information *after* hearing about the event from traditional news media (primarily television) or another person. This finding confirms the continuing pivotal role of interpersonal communication as the primary driver of news diffusion.

Platforms like Twitter, Facebook, and Reddit energize the process of diffusion through synchronous communication, allowing users to post and

then share information in real time. This does enhance the ability of traditional media to reach larger audiences and continue to set the news agenda, but it also decentralizes the power of diffusion, as individuals get a say about what stories are shared widely. Jonathan Bright (2016) found that 50% of sharing occurs less than 3 hours after publication, and 90% occurs less than 16 hours after publication. On Twitter, those percentages jump—50% of shares occur in hour one, and 90% happen within 10 hours. That means timing matters.

A study of Hurricane Katrina evacuees relocated to other areas of the country after a harrowing week in the New Orleans Superdome found that news did not diffuse to them in an accurate way. These evacuees, who included people from low-income households, non-English-speaking households, and nonwhite households, were described by researchers as being at “high risk” of being left out of the news diffusion process. Researchers found that mainstream media failed to adequately provide these displaced residents with meaningful information about how they could best prepare for the crisis and suggested that crisis communication plans need to consider how to reach populations that are not regular users of the mass media.

Research published in 2018 on the diffusion of crisis information, such as news shared during Tropical Storm Cindy in the United States in 2017, found that, in addition to timing, the influence of someone in the social media network and the nature of the content spur quicker diffusion. During a disaster, content on social media is shared rapidly, and speed increases if the initial post is from someone who has influence, typically measured in followers. Scholars have found that higher rates of diffusion are seen earlier on, when news is shared shortly after an event. But that rate of diffusion lessens over time, as more people and news organizations battle for attention among users.

Sometimes during crises, news is shared on social media via personal channels, from people experiencing the crisis. “People-based” media, such as Twitter, blogs, and online community forums, are critical in diffusing information. And typically, individual users are the ones circulating the initial information. Then, traditional media

step in to carry the story forward, disseminating information to a much wider audience. In a 2014 study, researchers found that while people are still the most turned to sources for stories centered on a crisis, social media posts are the second most frequently quoted sources, highlighting how reproduction helps hasten the spread of news.

There is also a dark side to diffusion—rumors and lies, both of which diffuse at a much faster rate than true news content. Studies have found that users who spread fake and/or extremely biased information are smaller in number, but also more active on social media and connected to more users than average. A 2019 study of the 2016 U.S. presidential election found that more users on social media favored Hillary Clinton for president by a wide margin, but supporters of President Donald Trump were much more active on social media channels. The study also indicated that that diffusion of center and left-leaning news moved in a traditional fashion—mainly journalists spread the news to the audience. But “fake news” was spread mostly by Trump supporters—mainly individuals who spread the news to other people but also to right-wing media outlets, who would then sometimes amplify the message.

A 2018 study found that the most shared stories were often viewed as negative and that strong emotional responses to information were related to higher rates of sharing. Stories that aroused anger or controversial information were seen as credible and interesting, and thus worthy of sharing.

Critics of the way news diffusion is studied point out that the bulk of the research has focused on major news events, and as a result of that focus on national or global events, while researchers haven’t spent as much time paying attention to how local news diffuses. Future research might also study the role of individual users in the diffusion process, rather than that of traditional media organizations. Understanding how power users of social media platforms contribute individually to the process of spreading—or sometimes originating—information could also yield new ideas about agenda setting and gatekeeping.

NEWS ORGANIZATIONS

News organizations—like organizations in all industries—are specialized entities that are functionally assembled to efficiently achieve the work of their industry, the creation of news. Organizations define the nature of work, divide that work into specific tasks, design jobs around these tasks, coordinate the tasks, and create processes that ensure work quality. News organizations have primarily three types of work to coordinate—journalism, business, and technology: journalists create news and information products that are presented to audiences; business personnel market the journalism products to audiences and advertisers; technology and journalism are merged to design, produce, and distribute journalism contents across media platforms. All these tasks are overseen by an organization's management.

News organizations comprise what is broadly referred to as *the press*, or news media. They vary greatly in size and scope from small town newspapers to radio and television stations to digital websites. They report news and public affairs to local, regional, national, and international audiences. In the United States, *The New York Times*, *Wall Street Journal*, network affiliates (ABC, NBC, CBS), cable and satellite stations (CNN, Fox News, MSNBC), and websites BuzzFeed, ProPublica, and Vox are well-known examples.

As a media-dependent entity, journalism has had to adapt to many fundamental changes in the

digital age. News organizations mirror the media evolution. Most are in a period of transformation, producing traditional mass media products (e.g., newspapers and television news) while reorganizing and reinventing themselves for opportunities in the online and social media realm. Digital media have also had a profound impact on the business of journalism. This entry explores the digital transformation of news organizations, beginning with a review of the organizational model of the mass media age, followed by an era of organizational change prior to the digital age, and finally the ongoing evolution of digital news organizations. Throughout it explains how journalism work is organized and structured, the impact of technology and economic factors on news organizations, and how news organizations have evolved over time.

The Mass Media Era

For much of the 20th century, news media operated in largely stable, geographically defined markets, lending a degree of predictability to media businesses. The number of news organizations in most markets, except major cities, was relatively small: one daily newspaper and several television and radio stations. Journalists decided the news (without audience input), and one had to work for a news organization to produce journalism (there was no other way to publish). These dynamics created limited competition in media markets, and many media firms producing journalism thrived, with profit margins routinely above 20% (4–5 times the average for Fortune 500 companies) into the first decade of the 21st century.

In the mass media era, news organizations were defined by the medium of content produced (e.g., magazine, newspaper, radio, television) and the geographic market of the target audience. The size of the organization mirrored the size of the market served. News outlets in urban areas could have hundreds of employees, each assigned specialized tasks; those in rural areas might have a handful of employees who did all the work. News organizations develop their own cultures—shared values and practices understood by organizational members—that

are guided broadly by the professional values of journalism, but these cultures vary considerably by medium, audience interests, and the journalists producing the journalism. These conditions explain why journalistic content focuses on similar topics and issues across geographic regions, yet the content itself differs greatly based on the medium, locality, and journalists who produce it.

During the 20th century, most news organizations organized work to create daily products of news content (e.g., a newspaper, or television or radio news shows). The work was a series of steps (information gathering, story creation, production, and publication or broadcasting) that resembled an assembly-line, each step with a deadline for the completion of the work. The process most often was linear, starting with an editor or news director assigning a reporter a story, the reporter gathering information and creating a draft of a story, an assistant editor reviewing the reporter's work, which then was passed on for preproduction (e.g., to a copy editor, designer, production assistant), before final approval by the editor or news director for placement in the news product.

The linear process of news production meant journalism work was organized around prescribed patterns—routines—intended to ensure the work is completed efficiently (i.e., meets deadlines and standards of journalism quality). However, the very nature of news—the unpredictability of when and where news occurs—makes the application of a linear production model and associated routines problematic in journalism. Media sociology scholars, who study forces impacting media content, have found that journalism routines create practices that result in predictable reporting that is overreliant on public officials, substitutes balance and fairness for truth, lacks diverse perspectives, and favors the status quo. Put succinctly, the routines that should produce journalism of high quality often led to reporting that did not meet professional standards.

Despite these critiques, news organizations thrived through much of the second half of the 20th century. Facing limited competition, news media shaped public discourse and were profitable.

Some news organizations brought national attention to social and political issues through their investigative reporting during this period. In 1971, after *The New York Times* published excerpts from the Pentagon Papers, a U.S. State Department study of U.S. involvement in Vietnam that revealed government deception, the Nixon administration sought a court injunction to prevent publication of additional excerpts. The U.S. Supreme Court ruled 6–3 against prior restraint of publishing, supporting First Amendment rights of a free press. Investigative reporting on the 1972 Watergate break-in by *Washington Post* reporters Bob Woodward and Carl Bernstein ultimately led to a Congressional investigation and the resignation of President Richard Nixon. The episode led to praise for news organizations' dogged pursuit of government corruption and deceit and—at the same time—questions of whether the news media were becoming too powerful.

In the 1980s, satellite and cable television became a platform for news organizations to broadcast live from around the globe. World leaders pondered the impact of the “CNN effect,” the broadcasting of news as it happened to an international audience. News media began to reflect broader globalization. The British Broadcasting Corporation extended its international radio and television programming. Al Jazeera, many of whose journalists began their careers at the British Broadcasting Corporation, first broadcast in 1996, and quickly gained influence beyond the Arab world. Also in 1996, Fox News launched in the United States to more than 18 million cable subscribers. Founding CEO Roger Ailes, a Republican Party media consultant for several presidents, changed the landscape of news by encouraging reporting that favored conservative ideals and the Republican Party.

These factors—the news media's apparent power, greater competition for audiences, increasing subjectivity and bias, and work routines that often undermined journalism's professional values—contributed to sagging public credibility. By the mid-1990s, news organizations—responding to changing news markets, lower credibility, and internal pushes to do journalism differently—recognized they needed to change.

The Transformative Years: Organizational Change, Digital Horizons, and Convergence

The stable news business environment began to unravel in the 1990s, even before the widespread use of the Internet to publish and consume news. News media firms quickly learned that they were not organized for innovation. The American Society of Newspaper Editors in 1995 created a Change Committee of editors from about 15 newspapers ranging in daily circulations from 5,000 to more than one million. These editors—from small papers such as *The (DeKalb, Ill.) Daily Chronicle*, *Grand Forks (N.D.) Herald*, *Wichita (Kansas) Eagle* to metropolitan papers, including the *St. Louis Post-Dispatch* (founded by Joseph Pulitzer), *The (Portland) Oregonian*, and the *Los Angeles Times*—used their newsrooms as laboratories for changing journalism processes and practices.

Common to these efforts was disassembling the assembly-line approach to journalism, removing the linear structure (e.g., editor to reporter with several assistant editors and producers along the way) and creating flatter, less hierarchical news processes. Many newsrooms abandoned beat reporting and created reporting teams focused on topics of reader interests. Some editors spoke of the need to “blow up” the culture of the newsroom, and that a less linear, team-based organizational structure would reorient how journalists think about and do their work.

The 1990s also saw broader levels of organizational change to newsrooms. For decades, part of the independence associated with journalism professionalism was apparent in the way news organizations were structured. Journalists enjoyed a “wall” of protection from the business and marketing interests of the organization. In most news organizations, business and journalism operations seldom interacted; often their offices were in different parts of the building or different floors.

Following trends in manufacturing industries, news organizations restructured to become more *integrated*. The reorganization created interdepartmental teams of business and journalism personnel, bringing together two areas of organizational knowledge to address business challenges and seize

opportunities. Research exploring the restructuring and integration of news organizations found that many efforts struggled. Many journalists thought removing the wall between business and journalism conflicted with professional values, jeopardizing their independence. Many journalists also saw change initiatives as pushed on them by top management. Journalists perceived attempts to change the culture of the newsroom as threats to journalism quality.

This transformative era, thus far, has noted two changes to the structure of news organizations: the integration of specialized departments (journalism and business, later informational technology) and the adoption of a team-based structure of news coverage and reporting. Both forms of organizational restructuring produced changes in newsroom cultures, yet bigger—largely unforeseen—changes were on the horizon.

News organizations began their own websites in the mid-1990s, and by 2000 nearly all news organizations were publishing news online, usually at no cost to the public. The Internet quickly changed the organization of journalism work. For example, deadlines became never-ending, as news could be posted at any time. There became a bigger premium on timeliness as a news value. Legacy news organizations (e.g., broadcast or print) no longer waited to break news at regularly scheduled evening broadcasts or in the daily newspaper. News organizations were reorganizing for a “digital-first” portfolio of traditional and online products.

The digital mindset prompted yet another form of restructuring in news organizations: interfirm alliances. The Internet required multimedia content—audio, graphics, photography, print, video, and nearly all news organizations were focused on content for their mass media product. Suddenly, newspapers needed people who could do audio and video; television needed more reporters and writers to maintain and update websites. The web required cross-media skills.

In the first decade of the 21st century, hundreds of interfirm alliances (usually between a newspaper and television in the same market) were formed in the United States and Europe. Commonly called *convergence agreements*, the

partnering firms shared resources to merge traditional forms of mass media (broadcast and print) into online media content. Early examples of these agreements were in Lawrence, Kansas, and Tampa, Florida. In Lawrence, the World Company moved its print and broadcast outlets in northeast Kansas into one building in 2001, where all media were coordinated by a central news desk.

In 2002, the *Tampa Tribune* partnered with WFLA, the local NBC-affiliate, to create TBO.com, a news website that featured content produced by both partners. In convergence agreements, the partners collaborated on stories, shared content, coordinated reporting, and cross-promoted their work.

Few convergence agreements lasted more than several years. News organizations learned how to do multimedia journalism. The short-lived partnerships taught journalists several lessons about digital media. First, broadcast and print newsrooms had different cultures, and despite shared professional values, journalists from different media thought differently about how to tell stories. Journalists also needed a digital skill base; it was no longer sufficient to specialize in print or broadcast media. Finally, online media created new opportunities for digital news businesses. Journalists no longer had to work for mass media; digital start-ups, such as the Huffington Post (now HuffPost, launched in 2005), Voice of San Diego (2005), and Politico (2007), became increasingly popular sources of news as well as career opportunities for aspiring journalists.

In 2008 to 2010, an economic recession contributed to significant reductions in advertising revenues to firms that produce journalism, as advertisers moved online and found many options for ad placement. The recession precipitated waves of layoffs in news organizations and the stark realization that few news companies had sustainable digital business models. Furthermore, a new force in journalism work and news organizations—social media—was just beginning to be felt. The reality was news organizations had been experiencing profound change for two decades, had reduced resources after rounds of layoffs, and had no clear digital business model, yet more radical changes were about to come.

The Digital News Organization

The financial fragility of news organizations became clear during the 2008 to 2010 recession. News consumers were moving online, where they had nearly an infinite number of choices for news. The vast majority of news organizations made their online content available for free, and news firms realized their mass media business models did not transfer to online business. The mass media model provided two sources of revenue: subscriptions or circulation and advertising. Online, news organizations were not generating money by posting content for free, effectively removing one source of revenue. Online ads generated considerably less revenue than legacy products because web metrics revealed the audience size for online stories was miniscule compared to the audience size of legacy products. Newspaper organizations found that their online advertising revenue amounted to trading “print dollars for digital dimes.”

Since the recession, news organizations have cut costs to stay in business and many daily newspapers have closed (in the United States, 1,408 daily papers in 2008 were down to 1,286 in 2017). Many news organizations became concerned about their ability to sustain themselves. Waves of layoffs continued. Between 2008 and 2019, the number of U.S. newsroom employees dropped by 23%, from about 114,000 to 88,000, according to the Pew Research Center. Reductions in the labor force were most acute for newspapers, down by 51% over the same period from 71,000 to 35,000 journalists.

The impact of fewer journalists has meant many stories go unreported, there are fewer resources for investigative journalism (which requires considerable time and resources), and many news organizations lost their most experienced and talented journalists. News organizations became smaller, younger, and less experienced; yet, at the same time, they became more digital, with younger journalists less resistant to forces of journalism change.

The digital age has also facilitated online-only news organizations. Some of these are national and international in scope and attract large audiences. Many target niche audiences with entertainment, business, and special interest content. In

2018, 37 online sites garnered 10 million or more unique visitors per month. Among them are the Bleacher Report, Gizmodo, MarketWatch, Mashable, and Slate.

However, most online news sites are grassroots, independent ventures (not owned by corporate media firms), focused on local news, seeking to fill the gap left by staff reductions or closures of news organizations in a particular region. Most are small and a considerable number are run on a nonprofit basis. A 2016 study found that 229 independent, online-only news sites existed in the United States. Of these, 60% existed less than 5 years, 70% employed five people or less, and about 85% focused on local or regional news. Forty percent were organized as non-profits.

News organizations continue to reorganize journalism work. They identify themselves less as medium-specific (television, radio, or newspapers) and more as content-driven information providers. News work is expanding, with fewer journalists expected to produce content for an expanding number of media platforms, including the organization's website, legacy products, and several social media platforms.

Digital technology allows for much journalism to be done outside the newsroom. Journalists use smartphones for gathering sound and video, and breaking stories are edited and posted online from the scene of the news. Thus, journalists find themselves in a paradoxical situation: they are more connected than ever by media to their editors and team members when doing journalism, yet they do more work alone, performing several previously distinct jobs (news gathering, editing, producing). News work has become networked. News organizations are less hierarchical and news processes less linear. The journalism organization and news work are more “fluid.”

News organizations increasingly use digital tools in news work. Web analytics provide audience data in real time (e.g., number of hits on a story, length of time spent on story, from which medium the story was accessed, and feedback such as comments, likes, shares, retweets). The impact of these web metrics on news work is controversial, as news organizations become focused on news that is popular and trending. The gate-keeping function of deciding what news is important is determined by the public as much as

journalists. Journalism's reduced gatekeeping role has had what some scholars call a "de-professionalizing" impact on journalism.

Social media are prominent must-use digital journalism tools, but also an ongoing puzzle. The social media news audience is growing, so news organizations post their content where the audience is. The user accesses the content at no cost; the news organization does not receive direct income from social media news consumers unless the user clicks on the story on the news organization's website. The puzzle is that news organizations know they need to put their content where the audience is, yet posting on social media brings no income. Social media are another way of giving away journalism at no cost and do not address revenue problems of digital media.

Many journalists use social media in innovative ways. Journalists are livestreaming news events, podcasting, hosting live chats, creating interactive communities, organizing events, and creating personal sites. News organizations increasingly see the social media presence of the journalists they employ as a valuable organizational asset. Individual journalists with larger social media followings bring larger audiences to news organizations.

Digital tools, including social media, provide journalists opportunities to engage citizens in ways mass media never could. Digital media are interactive tools for audience engagement and allow journalists space to create their own presences in ways that can enhance journalism professionalism. *The Washington Post's* David Fahrenthold won a 2017 Pulitzer Prize for his investigation of the philanthropy of Donald J. Trump during the 2016 presidential campaign. Fahrenthold posted hand-written notes on Twitter, asked social media followers to come forward with ideas, leads, and questions, and explained his investigation as he progressed. This type of journalistic transparency reflects the potential of digital media in journalism.

Fahrenthold's example also reveals how digital age news organizations are continuously experimenting and learning. News work continues to change. News organizations are smaller, organized for flexibility and fluidness, and less hierarchical and linear. News professional cultures are in flux as many news organizations struggle financially and

search for successful business models. Scholarship suggests the professional culture of journalism is becoming more commercialized, and news management has been key to integrating business values into newsrooms. The economics of news in the digital age have been an ongoing problem for many news organizations.

The profound impact of the digital age on news organizations is not complete. As new forms of mediated communication emerge, there will be a concurrent need for new journalism knowledge, skills, and continuous updating and training. These dynamics suggest that change and uncertainty for news organizations will continue into the foreseeable future.

NEWS SYNDICATION

News syndication is the distribution of content other than hard news or spot news to news media outlets. Typical content includes political commentary, travel articles, opinion, advice columns (for health, family, gardening, investment, house hunting, etiquette, cooking, etc.), puzzles, cartoons, comic strips, horoscopes, and entertainment reviews. In the old days, it also included short stories, chapters of novels, and whatever else would be of interest to a wide and varied audience. This entry defines news syndication and examines early and successful examples of news syndication, including the syndication of literary works, comics, and games. This entry then examines the broadcast syndication and explores some of the broader implications of syndication in the current news market.

Defining News Syndication

News syndicates do not produce their own work. These businesses pay journalists or cartoonists for their work and then sell their pieces to subscribing

news organizations. Syndicates might pay the journalist a percentage for every subscriber who uses their work, or a flat rate no matter how many subscribers they have, or a combination of flat rate and a percentage.

Other similar terms used in the past for news syndicates distributing feature content were newspaper syndicate and press syndicate to describe the news organization using the material, print syndicate to indicate the medium, and features syndicate to represent the type of content being distributed.

Wire services, news services, and news agencies are akin to news syndicates in that they distribute content to news outlets. However, these are news organizations that produce their own work by employing journalists to cover issues and events happening in various national or international geographic areas (e.g., Washington, D.C.) or follow the latest news on various topics (e.g., health). They distribute that content to other news outlets wanting their services. Local newspapers subscribe to news services because the news is of interest to their readers, but the newspaper does not have the funds to send reporters to cover the event. Some of these news service businesses are independent press agencies and others are press associations made up of various newspapers sharing their content, while still others are newspaper conglomerates, which are newspapers or news media companies selling their reporters' work to outside news organizations.

The origin of the word *syndicate*, loosely defined, is an organization or group of representatives combined for a common interest. In this case, these are mostly agencies granting permission to reprint or use content that they either own after paying the journalist or in which they represent the copyright holder and receive a percentage of the sales (commission).

Early Examples and Experiments

In times gone by, cities and even small towns supported many daily and/or weekly newspapers that ranged from a four-page broadsheet to several octavo pages. As one looks back in history, several newspaper owners engaged in what may be considered the forerunners of syndication.

A group of Boston patriots published a weekly series of stories from 1768 to 1769, called the

Journal of Occurrences, about the occupation of the British in Boston. These stories were transported to various states and inserted in newspapers throughout New York, Pennsylvania, and Boston. Samuel Adams and others were thought to be responsible for the stories, which fueled the fire for the American Revolution. This is an example of news being reprinted and distributed to newspaper readers in another region.

Features syndicates and press associations overlapped as newspapers helped each other save resources and fill their pages. An early occurrence of newsgathering and news distribution was in New York in the 1830s when the Association of Morning Newspapers pooled their resources for boats to meet and gather news from ships coming in from Europe. About 25 years later, the Harbor News Association and the Telegraphic and General News Association were merged to form the General News Association of the City of New York, which became the role model for future press associations, such as the regional New England Associated Press, the Southern Associated Press, and the Western Associated Press, among others.

Syndicates helped small newspapers compete with larger ones by supplying needed content from one area to another. Many journalism historians attribute Moses Y. Beach with forming the first syndicate in 1841, although it was for only one event. He arranged for a messenger to bring President John Tyler's address to congress to New York. Beach printed the address on multiple one-page inserts that were sold to about 20 other news organizations. Because Beach changed the title head for each newspaper, publishers could immediately give readers the complete address within their newspapers without the added time and expense of setting the type. Beach later became a founder of the first America press association, formed to gather and distribute news to other newspapers.

Other short-lived examples appeared throughout the decades, and into the Civil War when syndication filled a need. As President Lincoln called for volunteers in 1861, typesetters, printers, and reporters left their jobs to sign up as soldiers, leaving newspapers short-handed. Ansel Kellogg, editor of the *Baraboo* (Wisc.) *Republic*, found he could no longer fill his newspaper without help. He contacted David Atwood and

Horace Rublee of the nearby (Madison) *Wisconsin State Journal* and requested broadsheets to be printed with news of general interest on one side so that he could print local news on the other, filling his four-page newspaper. The arrangement worked well. Other editors noticed his success and made the same request. In addition to news and other items of general interest already printed in its newspaper, the *Wisconsin State Journal* included advertising, such as a lawyer's services. This is thought to be the first features syndicate that lasted longer than one or two events.

The First Profitable Literary Syndicates

Most of the prior syndicates were outcomes of short-term need and happenstance. After the war, several individuals began selling their short stories to multiple newspapers. Other people became literary agents by securing, representing, and selling the work of other writers to newspapers. About 20 years after the end of the Civil War, bona fide syndicate businesses were formed. Charles Dana of the *New York Sun* sold novelist Henry James's book chapters and short stories and also the works of author and poet Bret Harte, known for his tales about the California Gold Rush that readers on the East Coast enjoyed.

S. S. McClure set up in 1884 what is thought to be the first profitable syndicate to offer a variety of editorial content. McClure Newspaper Syndicate introduced American audiences to essays, celebrity interviews, poetry, and commentary. He started with the works of Rudyard Kipling and Conan Doyle, and over time the company signed up other literary giants including Fannie Hurst, Mark Twain, Jack London, H. G. Wells, Sarah O. Jewett, and Robert Louis Stevenson. The company would buy the rights to an author's work for about \$150 (about \$3,800 in 2020) and sell it to each newspaper for \$5 (about \$125 in 2020). Syndicates made more revenue with each newspaper that subscribed to the service.

McClure catapulted his company into a premiere syndicate by adding comic strips, sports features, columnists, and in-depth reporting exposes called *muckraking*. Investigative reporters exposed the underbelly of big business, unsafe working conditions, child labor, and crooked politicians, among other stories that were too expensive for most newspapers to pursue on their own.

McClure's was the first to carry columnist commentary about Washington, which was added to columns on gardening, fashion, interior decorating, and other general interest topics. McClure's syndicate was sold in 1952 and has been re-sold and folded into other businesses over the years, although the spirit of McClure's is still seen in other syndicates today.

The Syndication of Comics

Most news syndicates sold stories, poetry, commentary, and pictures. When New York newspapers began to publish comics in 1896, and then daily comic strips; news syndicates also added comics to their stable of offerings as the trend caught on. Comics were a profitable boon for the syndication business. One-panel comics and comic strips originated to make people laugh. Over time, the illustrations often commented on politicians, politics, and the state of the world, similar to today. Comics fill anywhere from one page in the daily newspaper to a whole section on Sundays and even more online.

The Syndication of Games

News syndicates are very much alive today after a long history of sharing news and learning how to become a successful business. There are businesses that offer general features from advice columns on any topic to comics to puzzles to Sudoku. Other businesses specialize in topics such as religion or environment features.

Over the years, the number of syndicates grew as the number of newspapers increased and needed content attractive to a general audience. At the end of the Civil War, three syndicates were in operation. In 1913, there were 40. By the 1930s, about 130 newspaper syndicates distributed 1,600 features to 13,700 newspapers. Fifty years later, 300 syndicates provided 10,000 features to newspapers and broadcast for a combined \$100 million in sales. Today, the tally of syndicates is much fewer than in the past because of newspaper closings and the availability of general content on the Internet directly to consumers.

The formula for syndicates' success, however, is their array of desirable content. When syndicates pay freelancers for exclusive material, then

it is available only to subscribing news organizations. It is up to the news outlet if they'd like the syndicated material to appear in print or digital or both. During the 2020 COVID-19 pandemic, for example, several newspapers, including the *Lansing (Mich.) State Journal* offered an expanded selection of syndicated features online such as comics, puzzles, crosswords, Jumble, Sudoku, and Solitaire for free as a service to its community members who spent months quarantined in their homes. Once consumers are on the newspaper's website, they often are attracted to local news stories they are willing to pay to read and then become subscribers to the digital newspaper.

An example of a popular international syndicate is King Features Syndicate, owned by Hearst Entertainment and Syndication Group. In addition to newspaper syndication, the Hearst Group also has cable network partnerships and television programming. King Features distributes about 150 features such as columns, comics and cartoons, horoscopes, puzzles, and games to about 5,000 print and online newspapers internationally. Some of its 65 comic strips include *Blondie*, *Dennis the Menace*, *Beetle Bailey*, and *Prince Valiant*. Its many columns include "Car Talk," "Hints from Heloise," and "Money Matters."

Another large news syndicate is Andrews McMeel Universal, which distributes features to 400 international and 2,500 U.S. news outlets. Its comics and cartoons include *Calvin and Hobbes*, *Peanuts*, and *The Far Side*. Its columnists include Dear Abby, Miss Manners, and The Animal Doctor, among many other features.

News Agencies Today

News agencies employ journalists to cover international and national hard news and spot news. They offer news stories in the forms of text, pictures, podcasts and video to newspapers, magazines, radio, and television news outlets worldwide. Although there are many news agencies, the "Big Four" include Thomson Reuters (the largest, founded in 1851 and located in London), the Associated Press (founded in 1846 in New York), United Press International (founded in 1907 in Boca Raton, Florida), and Agence-France Presse (founded in 1835 in Paris). Together, these

agencies supply about 90% of the news in newspapers internationally.

Broadcast News Syndicates

The same news agencies that supply hard news content to print and online newspapers also provide hard and spot news content to television and radio stations for their news programs.

News syndicates provide the content (e.g., columnists, horoscopes, comics) that goes around the hard news stories in the newspaper. Broadcast syndicates distribute television and radio programs (e.g., soap operas, game shows, children's shows, late-night talk shows) that air around the hard news programs. Broadcast syndicates buy the television and radio programs from the producers and then sell the programs directly to local stations.

There are three main types of broadcast syndicates: first-run syndication, off-network or second-run syndication, and public broadcasting. First-run syndication offers shows that are seen for the first time in a country. It might be a show that has never been seen anywhere or it has been successful in one country and is now new in another country. Off-network, or second-run, syndications are reruns of shows that are now licensed to other networks. For instance, while the situation comedy *Friends* might air in the early evening on one channel, it also can be seen later at night on a different channel in the same market. Public broadcasting syndication is shows produced by, and shared among, members of the Public Broadcasting Service (PBS) and independent stations.

The longest running syndicated television show is the children's show *Sesame Street*, which was first produced in 1969 by Children's Television Workshop (now Sesame Workshop). Its first-run shows are on HBO Max and reruns are on PBS. Another long-running syndication is the game show *Jeopardy!*, with more than 8,000 episodes aired.

A popular syndicated radio show is the news-magazine *All Things Considered*, produced by National Public Radio network. It has almost 15 million listeners who turn on their car radios during their afternoon drive home from work. A self-syndicated radio program and podcast is the

financial advisor *The Dave Ramsey Show*. It has 14 million listeners and is aired for 3 hours midday.

Early radio shows were recorded on transcription disks in one studio and mailed to other stations, who aired them when they could. The delivery system changed with technology. Transcription disks moved to phonograph records to tape recordings to cassette tapes to compact disks. Programs are now distributed through satellite and the Internet as MP3 and FTP downloads.

Impacts and Significance of News Syndicates

News syndicates were a lifesaver to many early local newspapers that did not have the resources or personnel to fill their pages. So, they shared news stories by mail. As audiences became more educated and mobile, they were interested in national and international issues. News agencies (also called *wire services*) used the telegraph to send breaking news to multiple newspapers over large geographic areas simultaneously. News syndicates would follow up with feature stories that included in-depth analysis, commentary, and illustrations of these national and also international events. A requirement was that newspapers must publish the content on the same day to appear as fresh news. Because of news syndicates, a person could travel across the country and not miss their favorite daily columnist or new chapter to a story. Small community newspapers could compete with metropolitan papers by offering similar content.

News syndicates introduced a library of classic novelists and other literary authors, such as Jack London and H. G. Wells into everyone's homes. In turn, these writers turned into literary giants because news syndicates introduced and sold their work across the country.

Media competed and borrowed from each other as some successful news syndicate columnists and cartoon characters made successful transitions to star in early radio programs, and popular radio personalities turned their work into syndicated features. Syndicates also helped newspapers competed with magazines' entertainment content.

While news syndicates produced many advantages to both the newspaper business and audiences, there were also disadvantages. While some critics were concerned that too much syndicated

content made newspapers appear homogeneous, others thought a shared culture was good for the nation. Other critics noted that in order to attract national audiences, syndicated content was too standardized and generalized; it missed out on hard-hitting topics unique to the community. Also, whereas some syndicated columnists would comment on conditions that happened in the region where they lived, they missed important topics or conditions happening elsewhere.

Journalists have worried about syndicate competition for their jobs. The concern is that the number of jobs could decrease as syndicates supply the work of a few writers to many newspapers. Newspapers could subscribe to a news syndicate for less money than hiring reporters.

The news media industry affects the syndication business and vice versa. On one hand, if news media do not have the resources to hire reporters, then they subscribe to news syndicates for content to fill their pages and programs. This is more revenue for syndicates. On the other hand, when news media have the funds to employ reporters, then they can fill their own pages and not use as much content from syndicates. This is less revenue for syndicates.

Today, news syndicates offer a wide variety of content to print and online publishers and radio and television producers who use the material to supplement their own content. There are about 412 news syndicates in the United States with many more news syndicates worldwide.

NEWS VALUES

Journalists are taught either through workplace socialization or college training that events and people may possess any of a half dozen attributes or values that can make them newsworthy. “Scoring” potential stories for those values is one of several routines used by news workers to define, select, and deliver news. This entry explores the history of this routine, explains how it was applied in the past, and evaluates how social media may be forcing changes in its application.

Most news professionals and academics agree that the traditional list of news values includes

conflict (struggles featuring people, governments, or social and natural forces), impact (the number of people affected and how much they are affected), proximity (geographic or demographic closeness to the reader, listener, or viewer), timeliness (the more recent, the more newsworthy), prominence (how widely known a person or event is on the local, regional, or national and international levels), and novelty (unique or bizarre people and events). Human interest sometimes is cited as a distinct attribute, but many argue that it is a component of the other six.

News workers usually are taught to test for the presence of these news values by asking a series of questions—Who? What? Where? When? Why? and How? Beginners also learn that potential stories should incorporate more than one value, and researchers have found that the initial paragraphs of a print or broadcast story usually contain at least two news values.

The vetting and application of news values have changed little over time. For example, at the turn of the 20th century, an editor from the *Chicago Tribune* instructed a reporter not to write stories about fatalities involving railroad employees or obscure people unless there were two or more such deaths or great property loss. Almost 90 years later, an analysis of broadcast news by William Adams found reporters applying a somewhat similar “exchange rate”: The death of one Western European equaled 3 Eastern Europeans, or 9 Latin Americans, or 11 Middle Easterners, or 12 Asians.

Development

Tobias Peucer, a doctoral student at the University of Leipzig, produced one of the earliest studies of news values and their attendant questions in 1690. Peucer included timeliness and significance (impact) in his list, and he wrote that “accounts” should answer six questions: character (or who?), events (or what?), cause (or why?), manner (or how?), place (or where?), and time (or when?). His dissertation included a longer list of stories that should not be written like accounts that challenged moral teaching or that focused on everyday events.

The systematic application of news values in mass periodicals dates from the penny press era of

the 1830s and was a product in part of technological and economic competition. During the course of the 19th century, publishers in the United States and Britain abandoned partisan political content and replaced it with stories that would attract more readers and advertisers. At the same time, they invested in new presses. By the 1890s, hand composition, steam-powered presses, and four- and eight-page dailies were being phased out. They were replaced by costly high speed presses, linotypes, and stereotyping equipment that made possible larger daily newspapers attractive to both advertisers and readers. However, many publishers overspent, or invested in already saturated markets.

To cut costs, publishers and editors needed a way to quickly and cheaply fill the larger newspapers. As part of the solution, they hired inexperienced reporters and invested little in their training. How these novices were to learn the basics of news work was problematic. Busy editors generally proved not to be generous teachers. Trial and error could be time-consuming. Not counting courses in typography, American universities did not offer a sequence of classes in journalism until 1893. The University of Missouri founded the first school of journalism in 1908. Beginners could consult “how-to-do-it” books like E. L. Shuman’s *Steps Into Journalism: Helps and Hints for Young Writers* (1894) or related magazine articles. From Shuman, they would learn three news values—actors (prominence), the place (proximity), and the time some newsworthy event occurred—were so important that they should always appear in the first paragraph of a story. Novices also could read one of the 300 works of fiction written about journalism or journalists during the closing decades of the 1800s.

Knowledge Brokers

Beginners generally found the best instruction came from interactions with what present-day researchers call *knowledge brokers*. In the case of late 1800s journalism, these brokers could be star reporters whose careers encompassed jobs at many newspapers, exposing them to the latest innovations in news work. Established reporters who worked at the same newspaper as the

beginner who needed help also could provide aid, as could editors of other types of periodicals who purchased freelance work from beginners. Rheta Childe Dorr (1866-1948), for instance, credited her early success in the late 1800s as a writer in the New York City market to helpful suggestions made by other, more accomplished freelancers.

The news values passed along by knowledge brokers proved durable and were codified in early journalism textbooks. A cluster of six such books published between 1903 and 1917 were particularly influential. All were written by former or still practicing journalists. Most received favorable reviews by magazines and large newspapers like *The New York Times*. The volumes were Shuman's *Practical Journalism* (1903), Charles G. Ross's *The Writing of News* (1911), Grant M. Hyde's *Newspaper Reporting and Correspondence* (1912), Harry F. Harrington's and Theodore T. Frankenberg's *Essentials in Journalism* (1912), Willard Grosvenor Bleyer's *Newspaper Writing and Editing* (1913), and M. Lyle Spencer's *News Writing* (1917). Five of the books included chapters that defined news, discussed news values, and outlined how to procure a story. Timeliness and emotional appeals also figured prominently in each book's list of attributes for gauging a person's or an event's newsworthiness. Hyde's list was typical: recency or timeliness, distance (proximity), magnitude (impact measured by loss of life or property, prominent names, unusualness, human interest, and personal appeal or applicability to the reader's life). Shuman's text appeared in nine editions between 1903 and 1928. Bleyer's and Hyde's books appeared in five editions each.

Some modifications to the lists were made during the balance of the 20th century. In a revision to his text, Bleyer (1873-1935), for instance, listed timeliness and reader interest as the prime news values. Bleyer further subdivided reader interest into several categories. They included extraordinary events; struggles for supremacy by individuals or nations; romance; mystery; adventure; human interest; and children, animals, and amusements. He wrote that audience interest in the news was proportionate to the reader's degree of familiarity with the event, the event's importance or prominence in the reader's life, and the event's proximity to the reader's home and business. He

argued that the best news was that which had the greatest effect on the largest number or readers.

Over time, others simplified Bleyer's list to six or seven distinct elements. For instance, the 1977 edition of Curtis D. MacDougall's (1903-1985) popular *Interpretative Reporting* reduced the list to timeliness, proximity, prominence, consequence (another term for impact), and human interest. An analysis of 75 journalism textbooks and guidebooks published between 1894 and 2016 suggests that the most common list is proximity, timeliness, prominence, human interest, conflict and consequence/impact, and unusualness. While the components of the news values list remained fairly stable during the past 122 years, there were other, notable reinterpretations. For instance, the same textbook analysis found some news values predate others and perform more functions than earmarking potential stories. The human interest value probably is the oldest and most flexible. Besides signaling news, it also functions as a dividing line between emotional feature stories and objective, fact-based stories.

Legacy Media

Scoring a story for news values also can be affected by reporter and editor culture and ideology, type of medium, size of news organization, application of other news routines, as well as other factors.

Traditional print and broadcast media, depending on their type or size, demonstrate a preference for different news values in their content selection process. Broadcast media prefer clusters of timely news because of the speed and frequency with which they can issue reports, and some research indicates television especially collapses the traditional news values list into audience interest, importance, and visual quality. Small weekly newspapers favor stories high in proximity, while small dailies favor proximity in combination with human interest or timeliness. On the other hand, metropolitan dailies favor stories emphasizing timeliness combined with prominence and conflict.

Similar clusters of news values occur when global news organizations communicate about less developed countries. These distant places rarely receive attention, but when they do, the

emphasis tends to be on hard news such as reports on natural disasters or armed confrontations. Researchers also have found that journalists are less likely to apply professional story selection standards when they report on an event or person closely connected to their own national interests. For instance, news from abroad must deal with more victims—a form of impact news value—before receiving attention. Research also indicates that any country's media demonstrate a preference for stories from other regions that are culturally, geographically, or psychologically proximate.

News value scoring by elite media also can filter down to smaller organizations. This “arterial process” means that the less prestigious news organizations mimic the selection decisions made by their larger broadcast and print counterparts because those organizations have more resources to pursue the news. In this sense, the scoring decision spread by elite media represents a *de facto* news value.

The filtering process can be rapid because prestige media often own press and video services that syndicate stories to smaller organizations as well as communicate what stories will be featured in the elite organization's next broadcast or print edition. The same holds true for the Associated Press and other news agencies. This “top-down” influence on journalists can be unconscious. “Gatekeeper” studies have found that editors responsible for selecting news agency stories for their publications unconsciously picked those stories from topical categories in the same proportion as the wire services offered them.

Finally, journalists from the traditional media generally have little contact with or feedback from readers, viewers, and listeners. Consequently, they strive to produce work that satisfies or that is praised by their immediate peer group. Critics have called such peer groups *monocultures* because news organizations often are staffed predominately by white, male, middle-class workers who share the same ideological outlook.

The influence of the news monoculture is so strong because it creates an unconscious bias for familiar places, cultures, and life histories when journalists write or select stories. Presumably, this socialization effect can be particularly powerful when it is not offset by college-level education *about* journalism. According to a 2013 survey of

the U.S. news industry by Lars Willnat, David Weaver, and G. Cleveland Wilhoit (2017), 92% of all U.S. journalists had a college degree, but only 46% of those degrees were in journalism. Those degrees were held by a workforce that declined from 112,072 journalists in 1982 to 83,370 in 2013. Monocultures also bias news value scoring in another way. Members have a tendency to replicate earlier story selections that incorporate the same news. Those selections may not mirror audience interests.

New Media

At the beginning of the new media era in the late 1990s, “opinion journalism” dominated. It was found online, on 24-hour cable talk shows, and in blogs. It often failed to observe the routines and standards found in mainstream journalism. Not only did opinion journalism threaten traditional standards, but it also tempted mainstream media to rely on gossip and trivia to attract audiences. Watergate journalist Carl Bernstein (1944–) called the result *junk journalism*. The media also produced more stories about how they did their jobs. Some suggest that new media (as well as traditional forms) were being stuffed with opinion rather than news because opinion was unlimited in supply, cheap to produce, and entertaining for audiences. Using “opinion journalism” in such quantities, however, risked eroding the standards for separating news from commentary and confusing readers, listeners, and viewers about the difference. In some cases, these trends overpowered traditional journalistic routines while creating new ones. In spite of the threat from “junk journalism,” journalists have added to the list of news values and modified existing ones. Research has found some news value-like characteristics accurately predict how often articles will be shared on social media. Those “shareworthiness” factors include geographic distance, cultural distance, negativity, positivity, conflict, and human interest. Another study indicates scanning, snacking, and monitoring behaviors better explain story popularity than do “clicks.” Others suggest inclusion, accountability, and accessibility should be added to the values list. Newspapers have demonstrated some flexibility in managing the new environment. When facing competition from 24-hour

cable news services, they deemphasized the timeliness news value. They tended to pursue stories with more proximity value—and greater depth. Newspapers later rejoined the competition for timely news by creating websites that permitted continuous updating of stories. Newspapers today continue to deliver local news to an audience, but how they deliver that news and what they do or do not offer has changed. Personals, stock quotes, comics, and complete results for major sporting events appear on their websites, rather than on their printed pages. These strategies were introduced by a new class of news workers with titles like “competition analyst,” “chief transformation officer,” and “digital content director.”

Some media observers also wonder how stories dependent on local or proximate news values will fare as large media organizations move from an advertising-based business model to a software-based model. During its 2019 merger with New Media Investment Group, corporate parent of the GateHouse newspaper chain, the newspaper chain Gannett pledged to continue focusing on meaningful local news. But corporate layoffs may make it difficult for employees to produce that result.

NEWSCASTERS, RADIO

When news breaks, many hear it first on radio. Tens of thousands of New Yorkers learned of the attack on the World Trade Center on September 11, 2001, when WCBS AM traffic reporter Tom Kaminski, on what had been a routine helicopter flight, described what he had just seen as he flew near the twin towers. Millions of Americans learned that World War II was over when CBS radio anchor Robert Trout announced: “This, ladies and gentlemen, is the end of the Second World War.” This entry provides both a brief history of American radio news and representative profiles of network broadcasters who helped create it.

Origins

In a sense, Guglielmo Marconi, one of the pioneers of broadcasting, can also be considered the medium’s first “newscaster.” In September 1898, he placed wireless equipment on two steamships that were part of a welcoming parade in New York harbor for American Admiral George Dewey and relayed information about the event to *The New York Herald*. It, in turn, printed a story that featured both Marconi’s information and details about the remarkable way in which it had been obtained.

For our purposes, “radio newscaster” means “one who reads scripted news aloud as part of a radio broadcast.” This is to differentiate the newscaster from a reporter who describes an ongoing event on the air (such as NBC’s Graham McNamee describing the return of transatlantic aviator Charles Lindbergh in June 1927 or the stunning eyewitness account by WLS’s Herbert Morrison of the explosion of the German dirigible *Hindenburg* over Lakehurst, New Jersey, in 1937). These were exciting examples of a practice common in the early days of radio. But regularly scheduled radio newscasts, or summaries of the day’s events, were relatively rare until the 1938 broadcast of what would become the first *CBS World News Roundup*, described below in more detail.

A station announcer who often lacked any training as a journalist typically read early station newscasts (and those only in the largest markets). In the 1920s, Harold Arlin of Pittsburgh station KDKA, credited with being the first full-time professional radio announcer in America, might provide news headlines one minute, read a community service announcement the next, then broadcast a prize fight or a football game later in the day.

An important distinction (but one not often made in the early days) existed between radio commentary and news. News reporters made the phone calls, tracked down sources, and presented the facts as they found them, while commentators gave their opinions (one book on radio journalism describes them as “mellifluous posers”).

Radio newscasts, as envisioned by such early practitioners as Edward R. Murrow, would instead strive for an accurate reporting of facts and a minimum of personal opinion. Radio newscasts became essential as world tensions grew toward war in the late 1930s. The radio news equivalent of “The Big Bang” came in the spring of 1938, when CBS broadcast a program featuring live reports from several European cities, ushering in an era of journalists who became among the best known in radio history.

Notable Radio Newscasters

Robert Trout (1909–2000)

Born Robert Albert Blondheim, Bob Trout possessed a baritone voice that retained traces of

his native North Carolina. He can be considered radio’s first real “anchorman” (Trout sometimes called himself an “emcee” or “master of ceremonies”) by virtue of his having been the anchoring voice for a CBS program broadcast on March 13, 1938 (which would evolve into *The CBS World News Roundup*), when Germany annexed Austria. CBS executives decided the event warranted a complicated transatlantic, multipoint live shortwave broadcast. The show included William Shirer in London, Ed Mowrer in Paris, Pierre Huss in Berlin, Edward R. Murrow in Vienna, and Trout, as the anchor in New York City, presented the news of the day. Trout would then pass the aural “baton” to Shirer and the others, and then introduce a newsmaker in Washington, DC, and finally end the show with a summary of the broadcast. It was a program that was both technically remarkable for its time and journalistically influential, creating the template for future radio newscasts, that is, an anchor reading a script, introducing reporters (live or recorded), and stage—managing the broadcast from beginning to end.

Trout began his life’s work by accident, hired as a handyman at a radio station in the Washington, D.C., area. One day the person scheduled to air a newscast failed to show up, and Trout (who adopted his air name from a family friend) was drafted into service, beginning a broadcasting career that would last nearly 70 years.

Trout was called by some “The Iron Man of Radio” for seeming to be on the air whenever something important was taking place, no matter what time of day or night. Indeed, he slept on a cot near the CBS studios for several days toward the end of World War II so he could be on the air with late-breaking developments at a moment’s notice. He also had an excellent ability to ad lib. As *The New York Times* wrote in its obituary, “His tireless ability to hold an audience when nothing was happening amazed President Franklin D. Roosevelt.” (Trout is also credited with coining the phrase “fireside chats” to describe FDR’s famous radio talks.) Toward the end of his life, Trout appeared on National Public Radio (NPR), offering commentary and talking about his historic broadcasts. His papers, including some of his original radio scripts, are preserved at the University of Texas at Austin.

Edward R. Murrow (1908–1965)

Murrow, born Egbert Roscoe Murrow, was not a radio newscaster in the same sense as Robert Trout. He considered himself first a reporter whose medium happened to be radio, but he is perhaps the best-known American radio broadcaster because of his reporting during World War II.

He majored in speech at Washington State University in Pullman, guided by teacher Ida Lou Anderson, whose method was to have Murrow and his fellow students study a text to extract all its meanings, and then read it aloud while she listened intently, asking questions, and guiding the discussion. (Anderson is also responsible for suggesting to Murrow that he make the dramatic pause in his famous “This—is London” sign-on, thinking it would help the overall pacing and effectiveness of his presentation.)

Murrow became Director of Talks at CBS in 1935 and then Director of European Operations for the network in 1937, moving to London and, as fate would have it, preparing to cover the run-up to the Second World War. His reporting, along with that of the famed “Murrow Boys”—the men (and one woman) he hired to bring the news of the conflict to America—would make him a broadcasting legend.

As a radio personality, Murrow set the standard for on-air authority. He reported the facts as he could ascertain them, but often described, in personal terms, what he saw happening before him. He was a pioneer in the use of actuality (newsmaker voices) and natural sound (ambient noise from an event), at one time even hauling his bulky radio equipment to a London Tube station-turned-air-raid-shelter to let listeners hear the sound of people scurrying to safety. His first-person account of the horrors of the Buchenwald concentration camp (“As we walked out into the courtyard, a man fell dead. Two others, they must have been over 60, were crawling toward the latrine. I saw it, but will not describe it”) is a classic of radio journalism. Murrow sometimes blurred the line between objective reporting and commentary as evidenced in his on-air denunciation of anti-Communist Senator Joseph McCarthy in 1954.

Despite his great success, Murrow was never comfortable on the air. His colleague Richard C.

Hottellet remembers watching Murrow at the microphone. Murrow’s leg pumped nervously as he read his script, and when he had finished, his shirt was soaked through with sweat. Murrow has become for many the patron saint of broadcast journalism, a title he would likely scorn, although Hottelet says Murrow “knew his worth” and used it to his advantage when required. His view was that radio (and later television) should be used to inform, challenge, and stimulate. As he said in a 1958 speech to the Radio and Television News Directors convention: “If radio news is to be regarded as a commodity, only acceptable when saleable, then I don’t care what you call it—I say it isn’t news.”

Mary Marvin Breckinridge (Patterson) (1905–2002)

Mary Marvin Breckinridge, as she was known when hired by Edward R. Murrow, is noteworthy not only for her reports but also for being a female radio journalist at a time when most women broadcasters were relegated to hosting homemaking programs. Breckinridge reported from several European countries in the months before the Second World War began. Her pieces from Berlin are of particular interest. On the air, she sounded like the upper-class woman she was, with clear diction and an often-amused tone, even while describing unsettling events. In reporting on the official Nazi newspaper in Germany, she said that its motto was “Freedom and Bread” and noted wryly “there is still bread,” a comment that somehow escaped the Nazi censors. Her broadcasting career was short-lived. She resigned from CBS in 1940 to marry diplomat Jefferson Patterson.

Susan Stamberg (1938–) and Bob Edwards (1947–)

Although they were not the first hosts of National Public Radio’s *All Things Considered*, Bob Edwards and Susan Stamberg established the program’s format and put it in the forefront of radio journalism. New York City native Susan Stamberg was named cohost in 1972, becoming the first woman to anchor a national nightly news broadcast in the United States, and bringing her distinctive voice (traces of her New York accent

remain) to what had been a male broadcasting bastion. Stamberg's own style was intimate—listeners could feel as if they were talking to her in a one-on-one conversation. This approach helped erase what had been the dominant style of presenting radio news, what has been described as “the voice of God” (male), presenting information in an authoritative manner. *All Things Considered*, with its mix of both hard news, feature material, and sometimes downright silliness (Stamberg regularly told listeners about her mother-in-law's recipe for cranberry relish), has broadened the scope of radio news and is one of the few news programs that can devote many minutes to one subject. Stamberg is now a special correspondent for NPR.

Bob Edwards had been a radio newscaster at the Mutual Broadcasting System before joining NPR in 1974 and becoming cohost of *All Things Considered* with Stamberg. He became the solo anchor for the new *Morning Edition* in 1979. Edwards is considered an excellent interviewer, exemplifying what has become the signature NPR sound, as described by the Peabody Committee in giving him an award in 1999: “. . . a man who embodies the essence of excellence in radio. His reassuring and authoritative voice is often the first many Americans hear each day. His is a rare radio voice: informed but never smug; intimate but never intrusive; opinionated but never dismissive. Mr. Edwards does not merely talk, he listens.”

After a disagreement with NPR management over the direction of *Morning Edition*, Edwards left the network in 2004 and joined XM Satellite Radio as host of his own program. Edwards and Stamberg, along with the other NPR hosts and news anchors, established an “up-close and personal” style of broadcasting that has influenced commercial as well as public radio newscasts.

Paul Harvey (1918–2009)

Paul Harvey's work extended from the early days of radio newscasts to shortly before his death. He began his career in 1933 at KVOO in Tulsa, Oklahoma, and over the decades, his voice had become one of the most familiar on radio. His *News and Comment* program began airing on the ABC radio network in 1951 and remained a broadcasting staple for more than 50 years.

Harvey's website said “News and Comment” and his feature program “The Rest of the Story” aired on more than 1,200 U.S. radio stations. Although he had worked as one, Harvey deviated from being a straightforward radio newscaster, *per se*. His shows were a mix of news, commentary, and commercials so tightly interwoven, it could be difficult for a listener to discern where one ends and another begins. Harvey's style was at once personal and idiosyncratic. He was considered a master storyteller, talking listeners through the details until he reached the payoff at the end. Harvey was also willing to play with the conventions of radio broadcasting, sometimes seeming ready to end his broadcast, only to return with another bit of information that added to the overall effect.

Lowell Thomas (1892–1981)

Thomas's 50-year broadcasting career began in the earliest days of radio news and ended when journalism was firmly established as part of the medium. He is noteworthy because, unlike many radio newscasters, he was primarily a reporter, having covered, for example, World War I from the frontlines. Thomas, with his avuncular tone, clear writing, and familiar greeting “Good evening, everybody,” became a fixture on radios around the United States. Thomas is credited with anchoring the first experimental television news broadcast in 1930, but radio was his preference. He used it to transport listeners to the exotic places he had visited (like the Khyber Pass and Mandalay) and the fascinating people he had met (such as Lawrence of Arabia and the Dalai Lama of Tibet). Thomas's regular radio appearances ended in 1976 after a remarkable 46-year run.

Conclusion

Despite repeated reports of its impending demise, radio survives and radio news reaches millions each day. The style of radio newscasters has changed significantly over the years—they are no longer expected to be, in the words of radio reporter Richard C. Hottelet, “trombone-voiced” announcers, but have now become much more conversational, as if an acquaintance of yours were telling you about the day's events, rather than declaiming from a stage.

With deregulation of radio, the number of stations providing news is in decline. Many stations no longer have their own news departments, opting instead—if they carry news at all—to use network or syndication services.

Radio is no longer the mass medium it once was because no one network or station can command the millions of listeners who, for example, tuned in back in 1940 to hear Edward R. Murrow from London—there are too many media choices today. But there remains a hunger for news relayed quickly and radio continues to provide that service. Despite media consolidation, economic considerations, and the fact that providing news is no longer a requirement for stations, radio newscasters may be a threatened but are not yet an extinct species.

NEWSPAPER CHAINS, OWNERSHIP OF

The trend toward newspaper chains in the United States emerged in the late 19th century and expanded significantly following World War I. Sidney Kobre, in his 1969 book *Development of*

American Journalism, dates the first U.S. newspaper chain to 1717, when publisher Andrew Bradford's Philadelphia-based *The Mercury* combined with the *New York Gazette*. Benjamin Franklin followed with his successful *Philadelphia Gazette* serving as a financial basis for investment in six other newspapers. Today, many newspaper chains are part of larger companies that include other forms of media, such as Hearst Communications, which also publishes magazines, and WEHCO Media, a regional company in Arkansas that also owns cable television systems.

Newspaper chains generally involve a series of newspapers located in geographically diverse cities and towns that are controlled by a company through some majority stock ownership arrangement, via outright majority shares, such as Gannett Co., Inc., a major newspaper publisher, or control of voting shares, such as through the Ochs-Sulzberger family, owners of *The New York Times*. Changing economics in the newspaper industry led to creation of newspaper chains during the 19th century. Significant capital was required to invest in new mass communications technology, such as steam presses, rotary press linotype machines, and photo engraving. The start-up cost for a newspaper in New York City after the Civil War reached \$1 million. Such an industrial enterprise required wealthy individuals or families to shoulder the expense. Gerald Baldasty, in his 1992 book *Commercialization of News in the Nineteenth Century*, wrote that newspaper publishing in the late 19th century had evolved into a major industrial enterprise that required attention to a set of organizational and financial issues quite foreign to an earlier generation of publishers.

By the 1880s, newspapers had become big businesses. They built major downtown office buildings, employed small armies of journalists and production staff, and made a significant impact in the community by underwriting community events. In this era, a newspaper could be a significant and profitable business and reflected the business sense of other industrial enterprises such as Standard Oil or Union Pacific railroads, which engaged in mergers to attain economies of scale. Likewise, newspapers found that mergers afforded savings on costs of paper and machinery supplies. In this period, news content, such as features and cartoons, was being pooled and sold. An independent newspaper

would have difficulty affording these resources or purchasing materials and content in the quantities of a newspaper chain. This entry discusses the forces that led to the growth of newspaper chains in the United States and the shift to public ownership of newspaper chains in the 1960s. It then discusses several examples of newspaper chains, the challenges facing newspaper chains due to the collapse of print advertising, and ongoing consolidation of newspaper chains.

Forces for Consolidation

The demise of partisan journalism, or papers owned by political parties, made it possible to reduce the number of papers and helped accelerate a consolidation in the newspaper industry after World War I, historian Frank Luther Mott wrote in his seminal 1962 book *American Journalism*. Other factors in driving chain ownership involved a more attractive sales pitch to advertisers, who found it less expensive and more convenient to buy space in one paper than in competing papers. Rising labor costs, the expense of pulp, and restrictions in the Associated Press membership that favored established newspapers were other factors pushing for consolidation.

During World War I, particularly in 1917–1918, the newspaper industry witnessed dramatic consolidation as stronger papers snatched up weaker competitors. Mott said by 1900, some 8 newspaper chains controlled 27 newspapers and some 10% of daily circulation. By the 1920s, some 60 newspaper chains owned more than 300 newspapers, comprising more than one-third of all U.S. daily circulation. Besides cutting production costs, publishers of combined newspapers found they could raise advertising rates, which further enhanced profits.

A broader cultural shift in management of U.S. business, where ownership became separated from control of firms as professional managers began to run companies, also affected the operations of newspaper companies. Historian Alfred Chandler Jr., in his influential 1959 article, “The Beginnings of ‘Big Business’ in American Industry,” described how this managerial phase in capitalism led to creation of large, vertically integrated, centralized, functionally departmentalized industrial organizations that developed a bureaucratic managerial structure. This period of specialization meant

publishers were now operating the entire business, bypassing the era when this task was performed by editors.

As newspapers became part of the U.S. industrial mainstream, publishers began to envision their readers not only as voters but also as consumers. This was a consequence of the rise of commercial advertising as a revenue source for newspapers, an evolution that influenced news content and helped shape the mind-set of a consumer society. As a result, the newspapers produced content that went far beyond the world of politics and voting.

Public Markets

A pivotal moment occurred in the mid-1960s when owners of media companies began listing their shares on stock exchanges, a shift from family ownership to corporate ownership. The trend toward public ownership started in 1963 when *The Wall Street Journal*’s parent company, Dow Jones & Co., went public. This was followed by the Times-Mirror Company in 1964, Gannett Company and *The New York Times* in 1967, Knight Ridder in 1969, and the *Washington Post* in 1971. Some of these families were able to retain control, and therefore preserve editorial quality, through a dual-stock ownership structure, where the family controls the voting shares and public shareholders have nonvoting shares. This arrangement was used by the Bancroft family for Dow Jones, the Graham family for the *Washington Post*, and the Sulzberger family for *The New York Times*, where this dual-stock arrangement still exists. New York University professor Rodney Benson has drawn a distinction between media companies traded on the stock market versus those that are privately held by wealthy individuals or families, which are somewhat insulated from Wall Street pressure to show ever-increasing earnings.

The decision for newspaper companies to open up to public shareholder ownership has been widely criticized as injecting a new level of corporate influence that has led to profit maximization and cost-cutting at the expense of editorial quality. Numerous studies and commentators have expressed concerns that corporate advertisers were not only influencing what was covered but also influencing what newspapers would not

cover. The Hutchins Commission, in its iconic 1947 study *A Free and Responsible Press*, said corporate ownership of news organizations is a powerful force that can weaken the autonomy of individual. Edward Herman and Noam Chomsky, in the 1988 book *Manufacturing Consent*, an influential media critique, cite conglomerate media ownership as a threat to independent journalism. The quality and depth of news production is a persistent concern. Research by Florida State University professors Deana Rohlinger and Jennifer Proffitt found independently owned newspapers cover controversial ideas more often than their corporate chain-owned counterparts.

Examples of Chain Ownership: Scripps, Hearst, and Gannett

Many historians believe modern newspaper chain ownership in the United States began with E. W. Scripps and his newspapers. Scripps was a contemporary of publisher Joseph Pulitzer, who primarily confined his operations to St. Louis and New York. Scripps, by contrast, looked for opportunities in the growing cities and towns in the Midwest and West.

The Scripps-Howard chain, which led to creation of United Press International, began in 1873 with the founding of *The Detroit News*. E. W. Scripps, his half-sister Ellen, and his brothers then founded *The Penny Press* in Cleveland and began an expansion that led to a chain of some two dozen newspapers by 1913. A steady stream of acquisitions ensued throughout the 1920s and 1930s with the purchase of newspapers in Pittsburgh, New York, Cincinnati, Akron, Memphis, Knoxville, Denver, El Paso, and more; at one point, E. W. Scripps owned 52 newspapers. Through consolidation, the chain settled into ownership of 19 daily newspapers by 1940, including the New York *World-Telegram*. Scripps's management owned 40% or less of the newspapers' stock and in the 1940s began allowing local editors to decide on state and local political matters.

The Hearst media empire began in 1880, when the father of William Randolph Hearst purchased the *San Francisco Daily Examiner*. W. R. Hearst soon expanded into New York, Los Angeles, Chicago, and Boston. He embarked on

an aggressive expansion in 1917, buying a newspaper a year, and in 1922, he purchased seven newspapers. At the end of 1933, Hearst had 26 daily newspapers, the International News Service, King Features Service, 13 magazines including *Good Housekeeping* and *Harper's Bazaar*, a newsreel company, and an assortment of mines, hotels, and other properties. This empire shrunk by the time of Hearst's death in 1951, but he still controlled about 10% of U.S. daily newspaper circulation.

One of the most influential modern media chains began when Frank E. Gannett acquired partial ownership of the Elmira (N.Y.) *Star-Gazette* in 1906. He soon expanded though New York, Connecticut, New Jersey, and Illinois. Under the leadership of Al Neuharth, Gannett epitomized the corporate consolidation of major news media during the 1970s and 1980s. Neuharth brought home significant profits for shareholders by raising advertising rates while cutting costs, a business model emulated by other media companies. During Neuharth's 15-year tenure, Gannett's revenues grew to \$3.3 billion, from \$390 million. Neuharth was a significant industry innovator, and in 1982, he launched the only major national daily newspaper to begin publishing after World War II, *USA Today*. This paper's pioneering use of color graphics and photos and brief stories influenced newspaper content. At the same time, Gannett newspapers were criticized for reducing staff and skimping on in-depth coverage of local news.

Gannett merged with New Media Investment Group, the parent company of GateHouse Media, in 2019 to form the nation's largest newspaper chain, with 250 U.S. daily newspapers such as the *Detroit Free Press* and the *Arizona Republic*. It also owns several hundred nondaily publications. Gannett and GateHouse projected a combined \$4.2 billion in revenue for 2019, assuming they were combined that year. Despite these large revenues, Gannett was planning to cut costs to pay off a \$1.8 billion private equity loan that New Media used to help finance the deal.

Collapse of Print Advertising and Ongoing Consolidation

Daily newspaper circulation in the United States peaked in 1984 at 63.3 million before declining

56% to an estimated 28.6 million in 2018, according to the Pew Research Center. Meanwhile, advertising revenue peaked in 2005 at \$49.4 billion, about a decade into the evolution of the commercial Internet. It has since declined 71% to an estimated \$14.3 billion in 2018. The period leading to the 2008 financial crisis was a pivotal era for U.S. newspaper chains, which were shocked by the sudden decline in advertising revenues and looked to outside investors for a rescue. Several of these high-profile acquisitions did not fare well.

The shrinkage of print advertising led to unusual corporate transactions with financiers. One significant example involved bond trader Sam Zell and his 2007 purchase of the Tribune Company. Tribune Co., then-owner of the *Los Angeles Times*, *Chicago Tribune*, *Baltimore Sun*, and other newspapers, borrowed an estimated \$8.2 billion to complete Zell's transaction that placed the company in private ownership. Zell was a Wall Street legend, known as the *grave dancer* for his reputation of profiting from distressed companies. One unusual aspect of the Tribune deal was the decision to finance the Zell acquisition by borrowing against the future revenues of employee pension plans. In less than a year, Tribune sought bankruptcy protection due to its extreme debt burden.

Zell's ownership was marked by a major newsroom backlash over his inexperience in running a professional journalism enterprise and his cost-cutting measures that led to hundreds of newsroom layoffs. Other private equity firms and hedge funds purchased newspaper chains in the wake of the Great Recession, including Alden Global Capital, a hedge fund that purchased the parent company of the *Denver Post* and subsequently laid off dozens of reporters there. Alden's stewardship led to an extraordinary newsroom revolt, with the *Denver Post* editorial page harshly criticizing its owner in an April 2018 editorial. The trend of layoffs accelerated at newspapers of all types of ownership with the spread of COVID-19 in the United States beginning in early 2020. The Louisiana *Times-Picayune* announced temporary furloughs of 10% of its 400-person workforce; Poynter Institute, a media think tank, counted about 80 separate instances of newspaper industry layoffs, furloughs, pay cuts, and

suspension or reduction of print publication as of late April 2020.

These examples illustrate the concerns raised by multiple authors who find the crisis facing American newspapers has been accelerated by the for-profit business model that prioritizes profits. Loss of local news coverage is a major concern. College of Charleston professor emeritus Jack Bass has concluded that one feature of modern newspaper chains involves concentrating their holdings in tight geographic groups to reduce production costs. A key goal of such arrangements is for two or more papers to share the same printing plant, thus yielding a major cost savings. Such geographic proximity is attractive to advertisers, who can more easily blanket a region of the country through a chain newspaper group.

Bass said some of these acquisitions led to higher quality journalism—Cox's acquisition of the *Greenville (N.C.) Daily Reflector* in 1996 led to a new computer system and Washington coverage of its congressional delegation, for instance. Other scholars agree that public interest journalism can be produced by some newspapers in commercial ownership. Yet concerns remain amid consistent rounds of layoffs and newspaper closures.

The consolidation continues unabated as of 2020. Penelope Abernathy's 2018 report, *The Expanding News Desert*, notes that 25 companies controlled the fate of nearly one-third of all papers in the United States. Abernathy wrote that roughly half of all newspapers in the country changed ownership over the past 15 years, some multiple times. Family-owned newspapers or small regional chains have been frequent targets of consolidation since 2014.

Chain ownership remains controversial to this day. University of Pennsylvania professor Victor Pickard and scholar Josh Stearns of the Democracy Fund, in a 2011 study on financing community journalism found that efforts to increase profits led to job cuts in the U.S. newspaper industry and closings of newspaper bureaus of various governmental agencies.

agreements to share business and operating expenses while maintaining separate news and editorial functions. Known as joint operating agreements, or JOAs, these were intended to connect a “failing” newspaper with a stronger one. In theory, these agreements permit competition in a newspaper market by saving the weaker paper. In practice, some critics argue, JOAs permit additional monopolization of the news product by shutting out other publications.

In 2009, there were 10 JOAs operating in the United States: Albuquerque (*Tribune and News*, this was the first JOA established in 1933); Birmingham (*News and PostHerald*); Charleston, West Virginia (*Gazette and Daily Mail*); Cincinnati (*Enquirer and Post*); Detroit (*Free Press and News*); Fort Wayne, Indiana (*News Sentinel and Journal Gazette*); Las Vegas (*Review-Journal and Sun*); Salt Lake City (*Tribune and Deseret News*); Tucson (*Citizen and Daily Star*); and York, Pennsylvania (*Daily Record and Dispatch*). These JOAs had varying time limits and renewal requirements; for example, the Charleston JOA was set to run through 2036, while the Cincinnati papers' agreement had initially planned to renew automatically every 10 years until 2007, when Gannett, owner of the *Enquirer*, chose not to renew the JOA.

Implementation of JOAs has entailed unintended consequences, according to a University of North Carolina study conducted in 2018, which found that one in five local papers—nearly 1,800—had since 2004 ceased publication, with many of these closures in rural areas. With almost 200 counties in the United States now having no local newspaper, large urban dailies have experienced a similar trend, as publishers have in turn experimented with innovations in an effort to survive, some converting to weeklies or employing layoffs and cutting back on print editions to save expenses. The handful of U.S. cities with newspapers still operating under such an agreement include Fort Wayne, Indiana; York, Pennsylvania; and Detroit, with JOAs in Las Vegas and Salt Lake City not set for renewal.

NEWSPAPER PRESERVATION ACT

The Newspaper Preservation Act of 1970 was passed in 1970 to allow antitrust exemptions for newspapers in the same geographic region with

Origin

The Newspaper Preservation Act was passed in response to a 1969 decision by the Supreme Court of the United States, *Citizen Publishing Co. v. United States* in which the Court invalidated a

JOA between two Tucson newspapers, finding it in violation of antitrust laws. Justice William O. Douglas famously wrote for six members of the Court: “Freedom to publish is guaranteed by the Constitution, but freedom to combine to keep others from publishing is not.”

Congress responded less than a year later, after strong lobbying from the newspaper industry, with the Failing Newspaper Act, which eventually became the Newspaper Preservation Act. The law begins with a finding that “it is hereby declared to be the public policy of the United States to preserve the publication of newspapers in any city, community, or metropolitan area where a joint operating arrangement has been heretofore entered into because of economic distress or is hereafter effected” under the act. The act grandfathered existing JOAs (including the Tucson JOA that precipitated the original lawsuit) and set parameters for the creation of new ones. The law also permits the paired newspapers to engage in activities that would otherwise be antitrust violations, such as price fixing, profit pooling, and market control. At the same time, the stated purpose of the act is to foster competing voices in communities where two newspapers may not be commercially viable.

The Justice Department opposed the law, while many newspaper owners—particularly those engaged in current JOAs—supported it. The Hearst newspaper chain sent letters to the Nixon administration and to President Nixon directly, requesting the administration’s support of the act. Several critics have suggested that Nixon’s favorable treatment of the act was a result of a desire for positive press coverage (indeed, the administration reversed its original opposition). The act was signed into law in July 1970, and 22 JOAs were in effect at the time.

The Act in Practice

Under the act, two newspapers may petition the attorney general for permission to create a JOA. The attorney general must determine that one of the newspapers is “failing” in order to grant the JOA. The act defines “failure” broadly, stating that a failing newspaper is one that “regardless of its ownership or affiliations, is in probable danger of financial failure.” The act does not require a newspaper’s status to be evaluated as to ownership or competition. However, there can be no

merger of editorial staffs, and editorial stances must be independently determined (although the meaning of “independently determined” has never been judicially interpreted). And, as noted below, what constitutes a failing newspaper is open to interpretation, with the decision ultimately in the hands of the attorney general.

In *Michigan Citizens for Independent Press v. Thornburgh* (1989), the Supreme Court upheld by a split vote (no opinion was published) the decision of the attorney general to approve a JOA between the *Detroit News* and the *Detroit Free Press*. The two papers had engaged in fierce competition and both had been losing money, though the *News* had led the *Free Press* in most competitive measures. An administrative law judge had found that the *Free Press*, the “failing” paper, was not in real danger of failing, and in fact, he did not believe that “reader and advertiser demand in Detroit is so inadequate that the market cannot sustain two profitable papers irrespective of changes in pricing policies.” Therefore, because the *Free Press* was not considered to be failing, the administrative law judge said, the requirements of the act had not been met.

Attorney General Edwin Meese disagreed. He noted that the *Free Press* had suffered a decade’s worth of losses and had no way to reverse that trend, so it was failing, and he granted the JOA. The citizens’ interest group appealed Meese’s decision to the courts. A district court upheld the attorney general’s decision, and the United States Court of Appeals for the District of Columbia Circuit upheld the district court’s decision. The appeals court said that while the *Free Press* was not in the traditional “downward spiral” that usually indicates a failing newspaper (decreasing circulation leading to fewer ads leading to even more decreases in circulation), it was on the brink of such a spiral down. The attorney general’s interpretation, the court said, was not unreasonable or capricious, merely different from the administrative law judge’s. And, said the court, Congress gave the burden to the attorney general to determine what constitutes a “failing newspaper.”

The Supreme Court upheld the appeals court’s decision by a split vote without opinion. *The New York Times* editorialized that Meese’s decision was probably the right one under the Newspaper Preservation Act but that the act itself was problematic and should be repealed. According to

The New York Times, the act ignores other, newer sources of competition: “Virtually every major metropolitan area has one or more substantial suburban newspapers that conceivably could gain market share if a faltering big-city newspaper were allowed to die.”

Controversy

Proponents of the act and of JOA arrangements argue that the stated purpose of the act—to maintain several newspaper editorial voices in communities that cannot economically support more than one—was valuable when the act passed and continues to be so. The Newspaper Association of America, in a 2005 brief to the Antitrust Modernization Commission, recommended that the act be retained. The act, according to the association, “preserves and prolongs editorial and reportorial competition between newspapers after the economic basis for commercial competition has disappeared” (Newspaper Association of America, 9). Newspapers in JOAs maintain strong editorial voices and do not appear to become homogeneous in their coverage and content. Online and other news outlets continue to provide serious competition to newspapers, and the act provides sustenance to a newspaper that otherwise would have failed, maintaining an additional editorial stance in the community.

Opponents suggest that newspaper readership continues to decline despite the JOA exemptions to antitrust law, and that the act relies on antiquated ideas of what competition and news sources are. The unclear legal definition of “failing newspaper” results in large news organizations pitted against smaller ones. Some see the act as providing a “soft landing” for competing newspapers that might take advertising and editorial risks they would not take in the absence of the option for a JOA—in other words, knowing that the newspapers can bail each other out means that they need not be as careful with their business decisions. Business columnist Daniel Gross took an even harsher view of the act: “JOAs insulate politically connected and favored industries from the competition that would cause them to change business models or innovate, and permit them to collect diminishing profits while doing nothing to ensure long-term viability” (Gross 2003).

NEWSROOM CULTURE

Newsroom culture refers to the assimilation of unwritten workplace rules and shared assumptions regarding values, beliefs, and practices. Unlike climate, which can vary between organizations and change with each leader, newsroom culture is embedded into the customs and mores of the profession and evolves gradually. Culture is

a sociological feature of all workplaces, a function of human interaction.

What makes newsroom culture significant is its influence on how news is determined and reported. Unlike some fields, journalism lacks explicit definitions to establish professional boundaries or standards boards to enforce norms. Instead, journalists depend on consensus established through peer interactions in newsrooms to define news and resolve matters of practice. Competing television stations carefully scrutinize each other's shows in hope that they stand out, but not by much, so that their similarities affirm common conceptions of news. Journalism is situationally located amid a nexus of individual and organizational factors; the latter is the focus of newsroom culture. Because journalists take culture for granted and rarely detect or acknowledge it, discussion is largely confined to academics studying the sociology of news.

As an organizational-level variable, newsroom culture is both distinct from and interconnected with routines and individual factors. The hierarchy of influences model promulgated by Pamela Shoemaker and Stephen Reese, which also includes extramedia and sociocultural forces, offers a series of concentric circles that illustrate the systematic factors that shape journalism. Those circles have fuzzy boundaries that are becoming even less distinct as journalism evolves amid profound changes in economics and social media. For example, scholars have identified individual role conceptions such as loyal-facilitator and watchdog that predict how journalists interpret their jobs. Yet such role conceptions are determined at least as much by organizational factors as by individual preferences. Newsroom culture research addresses the constants and variables that help mold news.

Constants

A constant within newsroom culture is the primacy of competition rooted not just in commercialism but also in peer approval. Newsroom morale depends on competition. Television journalists measure their effectiveness by ratings and celebrate the "get," an exclusive interview, or capturing an emotional moment on screen. Long before websites and portable satellite uplinks enabled 24/7 news operations, journalists chased after fast-moving breaking news and strove to get

information at least as quickly as their primary competitors.

If "news" is characterized by "new," breaking news is the epicenter of journalistic practice and identity. Most journalists aspire to create time-consuming reporting that has context and nuance, but they will drop everything to chase after the immediate. The desire to get the story the fastest is driven in part by the first-mover advantage of the marketplace as well as by a vocational ethos. Covering breaking news quickly and comprehensively is a marker of professional achievement, for no journalism organization wants to be perceived as slow or leisurely in its pursuit of time-sensitive information. Whether the organization is a private company or a public or nonprofit entity, getting the story quickly is, for better or for worse, a hallmark of a healthy newsroom culture.

Competition also exists within organizations. U.S. television pay scales encourage an up-or-out career path in which practitioners expect to stay at a station for just a year or 2, build a demo tape, and jump to a larger market, which creates a newsroom culture with shallow geographic roots. Some newspapers pit starting journalists against each other in undesirable beats or less prestigious departments to see who will sink or swim. Such competitions reinforce the other enduring facet of newsroom culture that the story trumps most other considerations. Journalists may debate the ethical ramifications of practices such as hidden cameras and weigh the potential harmful effects of a story, but they ultimately give the story itself preeminence, a thumb on the scales in favor of publication or broadcast. If the story is important, journalists feel little reticence about using stolen or leaked documents so long as they themselves did not commit theft to get the information, and publication would not appreciably threaten national security.

As a reflection of competitive pressure, journalism is defined by the news cycle. Sometimes described as a minute-by-minute taskmaster, the news cycle is more accurately manifest in the daily routines of the broadcast news show, tomorrow's edition of the printed newspaper, or the 4 p.m. website update. These rhythms have marked journalism since the newspaper became a daily in the 1700s and have persisted even as technology has enabled hourly and even faster routines. When a

gunman in 2018 killed five people at the *Capital Gazette* in Maryland, a staff member expressed the determination of colleagues by using Twitter to announce, “We are putting out a damn paper tomorrow.” The defiant note, delivered on an instantaneous social medium, reflected the primacy given to the next edition as an expression of the news cycle as well as a pledge by the newsroom not to be eclipsed on covering its own horrific tragedy.

Another constant in newsroom culture is what scholars have termed *news values*. Different lists, starting with that of Johan Galtung and Mari Holmboe Ruge in 1965, have been offered and with varying emphasis. Most common is immediacy, reflecting the priority of breaking news. Also frequently mentioned are magnitude, relevance to the audience, and prominence of the people involved. While scholars have delineated these values, they are less likely to be taught than caught, an inculcation that is a product of newsroom culture.

Internal Variables

Newsroom culture can vary with product type: broadcast, print, and digital. Because broadcast is so dependent on the aural and the visual, newsrooms privilege content that can sound or look good on air. Conversely, if a broadcaster trying to match a news story initiated by a print or digital outlet cannot locate suitable sound or visuals, the news station may skip the story. U.S. television news is further divided between over-the-air broadcast news operations ABC, CBS, and NBC and cable news outlets such as CNN and Fox.

While the broadcast outlets ostensibly confine their main shows to news segments provided by professional reporters, cable mixes reported segments with opinion shows. The latter is driven partly by economics, as opinion is cheaper to produce than is original reporting. However, cable also enables newsroom cultures that are different from broadcast and from each other. Similar distinctions can be seen in newspapers in Europe, which have generally cleaved between quality and tabloid operations.

These are differences not just in market segmentation but also in newsrooms. Each pursues stories the other would never touch, and they take

different approaches to the same story based on internal cultures. Some news operations born in the digital era, such as De Correspondent in The Netherlands and ProPublica in the United States, have newsroom cultures less dependent on immediacy and are free to pursue distinctive news stories. Such cultures are still competitive but at a different level, measuring success by fulfilling a mission rather than page views.

Another internal variable is the degree of autonomy granted individuals. Some newsrooms are more centralized than others, with news directors and editors ensuring that programs and publications offer a consistent look and voice. *The New York Times* carries the weight of being one of the world’s largest and most influential newsrooms, and the associated burden of ensuring its report is “Timesean.” *The Economist*, one of the world’s most prestigious news operations, has since its founding in 1843 eschewed author bylines so it can speak as a singular, authoritative voice. That practice yields a newsroom culture that privileges the collective over the individual.

External Variables

Newsrooms are unavoidably shaped by the countries in which they are situated. In nations where freedom of speech is legally protected and socially permitted, newsroom culture can adopt a posture that encourages independence from authority, though not all choose to do so. Such freedom is less possible when limited either by law or custom. Freedom of expression is more likely to be allowed in North America, Oceania, and western and northern Europe.

In authoritarian nations, newsroom culture accepts its duty to publish only official proclamations extolling flawless leaders and their exploits. In the Middle East, some nations that had allowed a measure of expression clamped down after the Arab Spring by shuttering independent media and censoring or blocking websites and social media. A rare exception is Qatar’s Al Jazeera, whose independence is encouraged so long as its critical gaze ignores the host nation. Even in nations where journalists have legal freedoms, if social mores call for deference to authority and sovereigns, newsroom culture is docile.

In nations where the press is more free, the economics of scarcity is a powerful variable affecting newsroom culture, especially in the United States, for two reasons. First, advertising, the source of roughly 50% to 100% of news organization revenues, has fallen precipitously since the start of the 21st century due to secular market changes. Growth in the Internet as a communications tool combined with advancements in adoption and application of big data techniques have allowed companies to shift from broad-reach advertising to personalized messages targeted to micro-niches and individuals. These shifts have been most pronounced in print but are increasingly affecting broadcast television as well. Second, faced with such revenue declines, media companies have been consolidating to gain economies of scales, which translates to layoffs. In some U.S. newsrooms, final corrections and headline writing have been shifted to consolidated editing centers hundreds of miles away, divorcing reporting from editing. In newsrooms that have lost half or more of their employees in just a few years, the grieving for lost coverage is palpable. With fewer people available, some newsrooms have traded depth for speed, preferring stories that can be told quickly to fill the next editions and freshen websites.

The search for new revenue to forestall more layoffs has in some cases prompted newsrooms to drop their church-and-state opposition to business-side involvement. Some have turned to sponsored content that was once condemned as advertorials or have given website space to companies promising to share remnant advertising revenue. The result has been a shift in newsroom culture from absolutism to embracing compromise in the name of necessity.

In other newsrooms, the economics of scarcity have prompted different changes in culture such as cooperation with competitors. Such joint action has occurred not just with former adversaries that through acquisition have become part of the same company but also with contending newsrooms that have decided competition is too expensive. Some have shared state capital bureaus, while others have collaborated on subjects such as climate change. While remaining competitive, sharing resources has blunted rivalries and amended newsroom culture.

Another cultural change fueled by the economic crunch has been, for some, a shift away from click-driven attention metrics dating to the dawn of the Internet age in favor of loyalty metrics designed to grow membership or subscriptions. Not all have embraced such a change in business model, and a number of news organizations have sought to grow subscriber revenue primarily to replace lost advertising income. But in some cases, a shift to a subscriber-based revenue model has reoriented the newsroom culture to spend less time chasing the immediate and more time pursuing topics and coverage that encourages return visits. A shift from attention to loyalty measures may result in far-reaching changes in newsroom culture by lessening the ascendancy of competition and a need-for-speed orientation.

Beyond national and economic factors, a third external element that has altered newsroom culture is social media, at both the individual and the organizational levels. In some cases, journalists are expected to use social media as a marketing tool for the organization and the individual. Those with large social media followings may be considered more employable.

In countries where journalism as a career is tightly controlled, as in France, social media use can be essential for those wishing to break into or remain in the field. Beyond a marketing function, social media can be used as information sources, either as statements from public figures or as eyewitness accounts from citizens. Yet it is when social media are embraced as audience interaction tools that they can have the greatest impact on newsroom culture. Such use is by necessity selective. Journalists are already inundated with seemingly endless email requests for coverage to benefit businesses, advocacy groups, and individuals seeking help with medical bills. Understandably, they tune out if social media are overused for the same pleas. But to the extent that journalists have the inclination and the time to sift the proverbial wheat from the chaff and seek opportunities for meaningful engagement with audiences, social media can change newsroom cultures.

A core element of normative journalism is providing the public's wants as well as needs. By serving as not just the *vox populi* but also as conversation-engagement tools, social media can help journalists detect audience needs and wants.

In turn, that discernment can redirect newsroom culture away from a gatekeeper orientation to one built on engagement.

Conclusion

Newsroom culture is an unarticulated yet powerful influence on news content. Traditionally marked by an emphasis on competition and shared values, culture varies with the primary output (broadcast, print, or digital), the degree of individual autonomy granted, and national tolerance for press freedom. As an enduring state, workplace culture is neither easy nor fast to change, and much of journalistic practice remains static, driven by peer approval and one-way communication from the newsroom to the public. Yet in recent years, economic scarcity and audience considerations through social media and online analytics have affected newsroom culture, and probably permanently so.

NEWSWEEKLY MAGAZINES

Newsweeklies, or weekly news magazines, were a staple of the news ecosystem throughout most of the 20th century, holding a place in the news cycle between daily reporting and the more in-depth analysis and opinion writing of monthly general interest or political opinion magazines. The idea of the newsweekly originated in England in the middle of the 19th century. The format generally summarizes the week's news, sometimes adding analysis or interpretation. The goal was to help busy news consumers understand what was most important by digesting the week's events. The magazines also do their own news gathering and did so increasingly over time.

While news magazines were a dominant cultural force for the second half of the 20th century, particularly in the United States, their relevance faded with the rise of the Internet and cable news networks and a faster news cycle in general. By the beginning of the 21st century, circulation had stagnated, and some venerable titles began to fail.

Although newsweeklies often had distinct points of view, they largely emphasized fact over opinion. This distinguishes them as a category from other weekly magazines that emphasize political essays and opinion, such as *The Nation*, *The New Republic*, or *The Weekly Standard* and those that include cultural reporting and even fiction, such as *The New Yorker*.

By some accounts, Britain's *The Economist* was the first newsweekly magazine, beginning

publication in 1843, insisting despite its format, that it was a weekly newspaper. However, *Time*, founded in the United States in 1923, established the widely recognized template for the weekly news magazine. This entry offers a survey of some of the most well-known U.S. and international newsweeklies.

United States Newsweeklies

North America has long been a center for news-weekly magazines, with the United States being a particularly vital market in the 20th century. Three titles in the United States dominated that market for most of that period.

Time

Henry R. Luce and Briton Hadden, two Yale classmates and friends, launched *Time* magazine on March 3, 1923, working out of a New York City office. Both men had previously worked for daily newspapers—Luce for the *Chicago Daily News*, as an assistant to columnist Ben Hecht, and Hadden at the *New York World*, then being run by Joseph Pulitzer's son Ralph. Both worked briefly at the *Baltimore News*, before they came back to New York to start *Time*.

One of their early advisers, Melville Stone, had been the head of the Associated Press and advised the cofounders that news would be in the public domain. This insight was key to the magazine's early editorial practice. Hadden and Luce clipped news articles out of several newspapers from the previous week and rewrote them into concise stories that summarized the news, adding context and history, allowing readers to feel as if they were keeping up with all of the important news of the week even if they weren't able to read a newspaper everyday.

Time's prospectus promised that the magazine would have no editorial page and that it would promote both liberal and conservative views. But while the magazine mostly held to its promise not to establish an opinion section, its point of view about the world, which was largely congruent with Luce's point of view, was quite readily apparent. While Luce was in charge of *Time*, the magazine was conservative, pro-Christian, and advocating a broader international role for

American interests, especially in China, where Luce had been born to Christian missionary parents.

Time stories were written in a deliberately distinctive, breezy style with literary overtones, jazz-age argot, backward syntax, and a slew of foreign words that were unfamiliar to American audience at the time but eventually became a part of the language, such as "tycoon" or "pundit." The writers, led initially by Hadden, also fused words together to create new portmanteaus, such as "cinemactor" or their own staff, which were known as "Timeemployees." People mentioned in *Time* stories received Homeric epithets that described them on each reference, turning them almost into recurring literary characters. New York Yankees baseball player Joe DiMaggio was described as "squirrel-toothed." A dancer was described as being "flutter-footed."

But most distinctive among Hadden's linguistic innovations was the magazine's inverted syntax. In a famous parody of "Timestyle," Wolcott Gibbs, writing in *The New Yorker* in 1936, captured the style well: "Backward ran sentences until reeled the mind," wrote Gibbs.

The earliest incarnation of *Time* relied mostly on facts that had been reported by daily newspapers, but the magazine did have a fact-checking department from its early days. *Time* began publishing color advertising in 1927, and that same year added the iconic red frame to its cover. By the following year, five years after the magazine's founding, circulation neared 300,000 and annual revenues were more than US\$1 million.

Brit Hadden died suddenly of an infection in 1929, and after finagling a stock purchase from Hadden's estate, Luce became *Time's* prime mover for most of the 20th century, and the magazine almost perfectly mirrored his worldview. The magazine's covers often featured portraits of businessmen, and later, after Hadden died, national leaders, diplomats, and generals. As a Christian and a capitalist, Luce disliked communism, but he had a soft spot for authoritarian leaders such as Italy's Benito Mussolini, Spain's Francisco Franco, and especially the Nationalist Chinese leader Chiang Kai-shek.

In 1927, before Hadden's death, *Time* had begun naming a "Man of the Year" (later broadened to Person of the Year). While being named

Man of the Year was a recognition of newsworthiness, more than it was a sign of the magazine's respect for the choice. Adolph Hitler was the 1938 choice, in a year when he conquered much of Europe. Still, the choice of Person of the Year became seen as a validation for many public figures, and some actively sought the prestige of the title.

Time's success led to the launch of other titles under Luce's leadership, notably *Fortune*, a monthly business magazine, and *Life*, which focused on photography. *Time* changed gradually over the second half of the 20th century as other media took over some of the functions of the weekly newsmagazine. Television, and later the Internet, subsumed much of the news summary value of *Time*, and the magazine became more interpretive, trying to explain the world to its readers rather than just summarize what happened.

In 2009 and 2010, *Time's* circulation fell dramatically. In 2017, Time, Inc., the parent company, was purchased by the Meredith Corporation, an Iowa-based magazine publisher, which quickly sought suitors for *Time* and its sister magazines. *Time* was then sold to entrepreneur Marc Benioff, separating it from the other former Time, Inc. titles.

Newsweek

Newsweek began publication on February 17, 1933, under the slightly different title *News-Week*. The magazine was first published by Thomas J. C. Martin, who had been a foreign news editor at *Time*. The magazine was funded by a group of investors including industrialists Ward Cheney, John Hay Whitney, and Paul Mellon. Its initial circulation was about 50,000 copies, far less than *Time's*, and the magazine would largely stay in second place in circulation throughout its existence. In 1937, *News-Week* merged with another weekly magazine, *Today*, and that magazine's editor, Raymond Moley, took over. *Today* had been founded by Vincent Astor and future New York governor W. Averell Harriman. That year, Malcolm Muir became editor in chief and changed the magazine's name to *Newsweek*. While *Newsweek* has consistently lagged behind *Time* in circulation and influence, it has largely

been seen as a less conservative choice for readers who did not like *Time's* politics. *Newsweek* was also the first newsweekly to give its writers individual bylines, in 1966.

Benjamin Crowninshield Bradlee became a foreign correspondent for *Newsweek* in 1954, eventually rising to become the paper's Washington bureau chief. From that position, he helped negotiate the sale of the magazine to the Washington Post Company in 1961. Bradlee was tapped to become managing editor at the *Post* in 1965, eventually rising to be the top editor. Osborn Elliott was named editor of *Newsweek* in 1961 and was responsible for turning it into a real competitor to *Time*.

In 1970, a group of 46 women employees filed a complaint with the Equal Employment Opportunity Commission (EEOC). At the time, most in-house *Newsweek* stories were reported by staff members holding the title of researcher. These researchers would then hand off their research files to "reporters" who would write the final story. The women who filed the EEOC complaint noted that *Newsweek* had a policy of hiring women only to be researchers and only rarely as writers. The filing of the complaint coincided with a *Newsweek* cover story about the women's liberation movement, with the headline "Women in Revolt," but that story was written by a freelance writer, since there were no women reporters on staff. The plaintiffs pointed out the irony that they were stifled in their own careers while the head of their parent corporation, the Washington Post Company, was a woman, Katharine Graham. The EEOC decided in favor of the women, who were represented by Eleanor Holmes Norton, who was an attorney for the American Civil Liberties Union at the time, and who would go on to become the nonvoting representative for Washington, D.C., in the U.S. House of Representatives.

Newsweek successfully spread to more countries than any other American newsweekly. By the early 20th century, the magazine was publishing at least a dozen international editions, including versions in Japanese, Korean, Arabic, Chinese, Russian, and Spanish. However, the first decade of the 21st century was a difficult time for the magazine. In 2008 and 2009, citing competition from online news sources, *Newsweek* dropped its subscriber

rate base and raised subscription prices, hoping to attract a more affluent audience. At the same time, the magazine refocused on opinion and analysis. By 2010, however, the magazine had lost money for two consecutive years, and the Washington Post Company put it up for sale. Audio entrepreneur Sidney Harman bought the magazine for US\$1 and the assumption of its debts. At the end of that year, the magazine merged with the online news and opinion publication *The Daily Beast*, and the British American editor Tina Brown took over both publications. Despite a redesign, losses continued to mount and the magazine was discontinued as a print publication at the end of 2012.

The title resumed publication under the ownership of the *International Business Times* in 2014. Although the magazine did briefly regain profitability, a series of controversies including factual errors and the firing of staff for reporting on the magazine's ownership depleted the magazine of much of its credibility among serious journalists.

U.S. News and World Report

This magazine began life as a daily newspaper, the *United States Daily*, which premiered in 1926, edited by journalist David Lawrence. The newspaper switched to weekly publication in 1933, and changed its name to *United States News*, but continued to publish in a newspaper format until 1940. In 1946, Lawrence launched a second weekly news magazine, *World Report*. As their titles indicate, *U.S. News* primarily covered domestic news and *World Report* focused on international news. Lawrence merged the two magazines in 1948, and by the early 1950s, it achieved a circulation of more than half a million. It surpassed one million in 1958 and, by 1973, had passed two million. Although *U.S. News and World Report* has a reputation for being the most politically conservative of the three major U.S. newsweeklies, its stories were the most straightforward and newspaper-like in the 1950s and 1960s. From 1962 until 1984, the magazine was employee owned. Mortimer Zuckerman, a real-estate developer and publisher, bought the magazine in 1984.

Since 1983, *U.S. News and World Report* has been best known for its college and university rankings. The first rankings were an outgrowth of

an earlier recurring feature, a ranking of influential people, called "Who Runs America?" The college and university rankings combined data collected by *U.S. News* with opinion surveys of academic leaders. The rankings have been enormously popular and influential, but also controversial. Colleges and universities often use the rankings in their marketing materials, while at the same time criticizing the methodology used to compile the lists. Complaints include an overemphasis on existing perceptions of prestige, on universities with the largest endowments, and on schools that manipulate their data in order to attain higher rankings. Nevertheless, *U.S. News* has published an annual book series of the rankings and profiles and sells stand-alone access to the rankings on their website. The success of the undergraduate rankings spurred several successor rankings, including lists of best global universities, best graduate and professional schools in several disciplines, best hospitals, and best cars.

In 2011, *U.S. News* stopped publishing a print magazine, and deemphasized news, focusing instead on its more profitable service journalism and ranked lists.

International Newsweeklies

While weekly news magazines have been prominent in the United States, they have a substantial presence in many other countries, with a particularly robust history in Europe.

The Economist

The oldest continuously published newsweekly magazine, *The Economist*, has always referred to itself as a weekly newspaper, despite publishing in a magazine format. James Wilson, a Scottish economist, started the magazine in London in 1843, in part to oppose agricultural tariffs that were under debate at the time, and he led it until 1857. The magazine at first was largely focused on economic and commercial matters and was a consistent advocate for free trade. Walter Bagehot took over as editor in 1861, and while he continued the magazine's coverage of business, he also expanded the coverage of public affairs and solidified *The Economist's* editorial independence. Bagehot also established a tradition that has

remained intact throughout the magazine's history: the anonymity of authors and the uniformity of editorial voice. *Economist* articles only very rarely carry a byline, mostly in cases when a notable person has contributed an opinion article, in certain year-end reports, or to highlight a potential conflict of interest. Otherwise, the magazine reads as if it were written by a single author, in a voice that carries a kind of dry wit and cosmopolitanism. Readers are assumed to have a working knowledge of classical economics, and the magazine writes from a distinctively classical liberal worldview. Despite its strong editorial stance, it is generally respected for its independence, fairness, and rigorous fact-checking.

The Economist only began accepting advertisements in 1888, and circulation remained low, though the publication was both profitable and influential. In the Bagehot era, circulation reached about 4,000 copies, and by the 1920s, when *Time* was launched in the United States, *The Economist's* circulation stood at around 6,000. In 1928, the magazine established a co-ownership structure, evenly split between the Economist Trust and the *Financial News*, later known as the *Financial Times*. Pearson, the parent company of the *Financial Times*, sold its 50% ownership stake in 2015, with the bulk of those shares going to Exor, a holding company owned by the Italian industrialist Agnelli family. The magazine's editor is appointed by a board of trustees and cannot be removed without the board's approval. By 2020, roughly half of the magazine's readership was in the United States, though two thirds of its editorial staff work in London. As of 2020, circulation stood at 1.5 million.

Maclean's

This Canadian magazine began its life as a monthly business magazine in 1905, founded by John Bayne Maclean. Before the end of that year, Maclean had renamed it *The Busy Man's Magazine*. In 1911, since the magazine had trended away from business and toward news and public affairs, Maclean renamed it yet again, this time after himself. Unlike other news magazines, *Maclean's* published monthly until 1917 and also included fiction. In the 1920s, H. Napier Moore, an Englishman, edited the magazine, which

promoted the role of Canada as a part of the British Empire, though his role in running the magazine was soon subsumed under that of W. Arthur Irwin, who turned it into a vehicle for Canadian national pride. In 1945, Irwin officially became editor, and the magazine began to focus on news features, though it maintained an identity as a monthly general interest magazine until 1975, when it became a fortnightly news magazine. In 1978, the magazine became a weekly. Like its United States counterpart *U.S. News, Maclean's* began publishing a university rankings issue in the 1980s. In 1994, Rogers Communications purchased the magazine. Falling print revenues forced the magazine to revert to monthly publication in 2017. In 2019, the magazine was sold to St. Joseph Communications.

Der Spiegel

Der Spiegel (which translates to "The Mirror") is continental Europe's largest weekly news magazine. It occupies a center-left political stance and is recognized particularly for its investigative journalism. The magazine started as a publication of the British occupational administration of West Germany in 1946. The magazine was quickly handed over to German editor Rudolf Augstein, and from January 1947 until his death in November 2002, he maintained control of the magazine. From 1950, Augstein co-owned the magazine with John Jahr, who in 1965 formed the publishing company Gruner + Jahr by merging his shares with Richard Gruner's. Augstein bought out Gruner + Jahr in 1969, and in 1974, he gave half of the stock to employees.

The magazine has had a contentious relationship with almost all of Germany's leaders, both before and after reunification, which some commentators see as an indication of the magazine's independence. In addition to stories that summarize the week's news, *Der Spiegel* publishes lengthy, in-depth investigative stories. In 1962, the magazine published a report on the low state of readiness of the West German armed forces. The minister of defense, Franz Josef Strauß, ordered a raid of the magazine's offices and had several editors, including Augstein, arrested for treason. Other magazines loaned staff to *Der Spiegel* to help them produce the next issue.

Eventually, a court found the magazine not guilty, and Strauß was forced to resign amid a more widespread shakeup in the cabinet of chancellor Konrad Adenauer. The incident was seen as an attack on freedom of the press and led to a change in the political atmosphere of post-war Germany. In 2010, *Der Spiegel* worked with WikiLeaks to publish stories based on documents leaked from the U.S. State Department, in collaboration with *The New York Times*, *The Guardian*, and other international newspapers. In 2013, *Der Spiegel* worked with Edward Snowden to publish stories about the U.S. National Security Agency's wiretapping of German chancellor Angela Merkel's cell phone.

L'Express

This news magazine, the first in France, debuted in 1953 and was modeled on *Time* and *Der Spiegel*. The magazine generally had a center-left political orientation and opposed war in Algeria. The French government blocked publication of *L'Express* because of a book review by Jean-Paul Sartre, and the magazine had to agree to publish a new edition of the magazine without the article in order to resume publication. In 1964, several *L'Express* journalists left the magazine to start a rival magazine, *Le Nouvel Observateur*, and *L'Express* responded by becoming a less explicitly political publication. Circulation quickly rose from about 150,000 copies to half a million. The magazine has had several owners over the course of its existence, including Altice, headed by French-Israeli billionaire Patrick Drahi, which took over ownership in 2014.

The Week

One of the more recent news magazines, *The Week*, began publishing in the United Kingdom in 1995. It was founded by Jolyon Connell, formerly of the UK's *Sunday Telegraph* newspaper. In 2001, the magazine began publishing a U.S. edition, followed by a short-lived Australian edition that lasted from 2008 to 2012. *The Week* also publishes an edition for children, *The Week Junior*, aimed at 8- to 14-year-olds. *The Week* intends to provide readers with various political viewpoints. In 2016, U.K. circulation topped 200,000 copies,

and U.S. circulation stood at more than half a million.

Tempo

In Indonesia, *Tempo* magazine was founded in 1971, 3 years after General Suharto came to power. Like many other news magazines, *Tempo* deliberately emulated *Time*, including the iconic red frame on the cover. *Tempo* initially supported the regime, hoping to help plan for economic development. But as the government became increasingly oppressive by the mid-1970s, *Tempo* had to find ways to deliver hidden messages that would not upset the system of censorship, licensing, and intimidation that manipulated the Indonesian press, and the magazine became known for its subtle use of language to get these taboo ideas across to readers. The Suharto government banned *Tempo* in 1994, which led to widespread protests and an underground press movement in which former *Tempo* reporters worked with activists to distribute news on the internet. After Suharto was forced from power in 1998, *Tempo* regained its license and began publishing independent news in a more straightforward manner. By 2010, its circulation stood at about 300,000, which is small considering Indonesia's population, but the magazine is influential beyond its circulation numbers.

India

As a populous nation with a robust and often raucous newspaper industry, India has also supported at least a half dozen news magazines at various times. *India Today*, an English-language weekly news magazine is India's most widely circulated magazine of any kind, with a readership that neared eight million in the 2010s. Other notable titles include *Frontline*, *The Week* (unrelated to the British and American newsweekly), *Outlook*, *Tehelka*, and *Shraman Bharti*.

Brazil

At least four news magazines vie for Brazil's huge readership. *Veja*, *CartaCapital*, *época*, and *Istoé* are all titles worth noting. Three of these were founded by the same man, Italo-Brazilian

journalist Mino Carta. He founded *Veja*, Brazil's leading news magazine in 1968, followed by *Istoé*. *CartaCapital* was his latest and is an openly political publication.

Contemporary Issues

The Internet has continued to erode the readership and, perhaps more importantly, the advertising revenue of weekly news magazines, making many of them tenuous business propositions in the 2020s. Most of these magazines have abandoned their original concept of summarizing the week's news in a digestible format, focusing instead on lighter lifestyle or celebrity coverage. Some continue to publish investigative journalism of their own—particularly Germany's *Der Spiegel*—but the immense expense of that kind of reporting makes it difficult for once-venerable titles such as *Time* or *Newsweek* to support ambitious work.

NEXSTAR MEDIA GROUP

Nexstar Media Group (1996–present; formerly Nexstar Broadcasting Group) is the largest local television broadcast and digital media company in the United States. As of July 2020, the company, headquartered in Irving, Texas, has 196 full power owned or serviced stations in 114 markets reaching approximately 63% of the U.S. television households. The company employs nearly 13,000 people across the United States and produces more than 250,000 hours of local content per year. The media company focuses on acquisition, development, and operation of television stations and interactive community websites in medium-sized markets in the United States. In 2017, Nexstar Broadcasting Group, Inc. changes its name to Nexstar Media Group, Inc. This entry examines Nexstar Media Group's founding and its connection to deregulation, retransmission fees, and media consolidation.

Perry Sook—Founder

Perry Sook was born in DuBois, Pennsylvania, in 1958. As a teen, he was a DJ at a radio station in Punxsutawney, Pennsylvania. He attended the Scripps College of Communication at Ohio University, where he would call Pittsburgh Pirates games for the college radio station. Sook tried to make a career as a news anchor and weatherman at small station in Clarksburg, West Virginia. He realized he was not meant to be an on-air talent and decided to go into management. He believed

the quickest road to management was through sales, and he landed his first sales job at a small radio station in Kissimmee, Florida. The radio station struggled to pay his sales commissions and Sook unsuccessfully fought for the money owed to him. His frustration over not being paid influences his current philosophy that all his sales representatives must be paid their commissions.

Sook moved on to be the National Sales Manager at KTVT Dallas at the age of 27, moving up to General Manager 2 years later. By the age of 32, he was President and CEO of Seaway Communications, Inc., owner of network affiliated stations in Bangor, Maine, and Wausau, Wisconsin. During this time, Sook began to learn to negotiate and how to acquire television stations. When he was unable to get the Seaway board to agree to his acquisition proposals, he took \$250,000 of his own money, plus a loan from the finance arm of AT&T and bought a Fox affiliate (WDKY) in Lexington, Kentucky, and created Superior Communications. In 1992, he purchased KOCB in Oklahoma City for \$23 million. He would sell Superior Communications to Sinclair Broadcasting for \$63 million in 1996. The next day after the sale, Sook founded Nexstar, starting with the purchase of WYOU-TV in Scranton, Pennsylvania.

Early Days—Deregulation

Deregulation in the 1990s led to consolidation of ownership in the local broadcast industry. The Telecommunications Act of 1996 was an overhaul of the telecommunications law established 62 years earlier. The goal of the new legislation was to “let anyone enter any communications business, to let any communications business compete in any market against any other.” The law also opened the door to media acquisitions and mergers that would consolidate the industry into a few major companies. Nexstar began to build an empire by acquiring other companies with groups of stations.

Sook’s vision of the company revolved around localism and away from syndication-heavy programming. He believed the company would be successful if it concentrated on medium-sized markets with a commitment to local news. Sook developed an experienced executive team, recruiting Blake Russell, senior VP of station operations,

COOs Timothy Busch and Brian Jones, and VP/Director of Engineering Richard Stolpe.

The company went public in 2003, after acquiring Quorum Broadcasting for \$230 million in cash, stock, and debt. The purchase of Quorum spread Nexstar’s reach to nine mid-sized markets with 21 stations. The stations ranged from eighth on the Nielsen Designated Market Area, or DMA (Washington, D.C.) to the 196th DMA (San Angelo, Texas).

Retransmission Fees

Sook is credited for creating the first “shared services” agreements among American television stations in 1998. Federal law empowers broadcasters, including corporations that own TV stations such to charge fees to local cable providers for rights to carry or “retransmit their signals.” Sook was looking to find a second revenue stream for local broadcast television. He took action against the disparity between the value broadcasters receive for their content and the high level of viewership of the cable and satellite companies. Nexstar’s original agreements with cable, direct broadcast satellite providers, and telcos were primarily 3- to 4-year contracts with a revenue of \$50 million over the term of the contract. In 2005, Sook was able to leverage and negotiate higher retransmission fees, and 3 years later, Nexstar announced the new fee structure generated \$75 million in revenue. Nexstar’s stance on retransmission fees strengthened the company’s influence and today retransmission fees represent a substantial portion of the local broadcasters’ revenue.

After the purchase of Quorum Broadcasting, Sook began to leverage his station sprawl to convince satellite companies to pay for the stations’ content, but he struggled to persuade the cable companies. Nexstar and Cox Cable began a feud over the retransmission consent agreement. After a nasty year-long battle, including the broadcasting of Sook’s personal phone number, Cox refused to air the stations, leaving viewers without the affiliate programming. Nexstar launched a campaign to persuade cable subscribers, many wanting to see their programming. Finally, Cox agreed to pay for the signals. Retransmission fees are significant portion of revenue for Nexstar. In 2020, Sook stated that Nexstar’s \$2

billion in revenue is the result from the fight to be paid the fees.

Retransmission fees are a key factor to a healthy future for broadcast companies. Kagan, a group within the S&P Global Market Intelligence's TMT unit, projects U.S. TV station owners' retransmission fees from cable, direct broadcast satellite, and telco video operators, and virtual multichannel service providers continued growth and will reach total gross revenue of \$16.26 billion by 2024.

Tribune Purchase

Advocates of media deregulation would argue that the consolidation would lead to more efficient and profitable stations, and critics would argue that the deregulation would lessen minority access to the media and hurt journalistic ethics.

In 2011, Fox Broadcasting dropped Nexstar stations in Evansville and Fort Wayne, Indiana, and Springfield, Missouri, because Sook would not agree to the new affiliation terms. Sook put Nexstar on the market with a billion-dollar price tag, but there were no substantial offers; a year later, Sook took Nexstar off the market.

From 2010 to 2016, Nexstar completed several station acquisitions, purchasing the Grant Group, Newport Television stations, and Landmark-owned KLAS in Las Vegas. Nexstar concluded this binge with a purchase of 71 television stations and digital media properties of Media General, for \$4.6 billion. At the time, Media General was the third largest owner of stations in the nation.

In 2017, Sinclair Broadcasting attempted to buy Tribune for \$3.9 billion but the Federal Communications Commission (FCC) reprimanded Sinclair for its conduct during the sale. In 2019, Nexstar Media Group proposed to purchase Tribune Media for \$6.4 billion. The Justice Department and Attorneys General in three states filed a federal complaint against Nexstar and Tribune Media, on the grounds the merger of the two companies would eliminate competition, which would then lead to higher retransmission fees to cable and satellite providers. To satisfy the Justice Department, the deal would require the sale of stations in 13 markets where the consolidation would result in unfair competition. Nexstar agreed

to sell 21 stations in 16 markets, including those required by the Justice Department, complying to FCC ownership restrictions and antitrust complications. In 2019, the FCC approved the sale of Tribune to Nexstar for \$6.4 billion, making Nexstar the largest TV station ownership group in the United States.

The 2019 merger with Tribune made Nexstar the top broadcast affiliate for Fox (43 stations) and CBS (50 stations) as well as the number-two partner for NBC (35 stations) and number three for ABC (30 stations). Nexstar owns stations in 15 of the top 20 television markets and reaches 69 million television households. Nexstar dominates market coverage with stations in 114 markets, with Gray, in second with 95 and Sinclair, in third with 89. Nexstar's ad revenue of \$2.4 billion is ahead of Sinclair's \$1.6 billion. Nexstar has become the dominate corporation in coverage, revenue, and markets. In 2020, Nexstar reported that their 2019 fourth-quarter net revenue was \$1.1 billion, up 37.9% from the same quarter of 2018.

Nexstar owns WGN, a nationwide pay television network. The company also has a 31% share of the Food Network and Cooking Channel. In response to the Tribune sale, Nexstar's rival Sinclair purchased Fox Sports Networks from Disney and became the largest owner or operator of regional sports networks.

After purchasing WGN in the Tribune sale, Nexstar launched a 3-hour, live, primetime newscast, seven nights a week on WGN.

Nexstar forged a deal with the National Football League's Las Vegas Raiders to have exclusive content and broadcast rights of Raiders' pre-season games and other related programing, in May 2020. Their goal is to deliver the broadcasts to the five Nexstar television markets, across three states, to reach more than 9 million television households. TV stations in Los Angeles, Bay Area, Salt Lake City, Honolulu, and Bakersfield are part of the multiyear flagship agreement.

According to Pew Research in 2019, six publicly owned local TV station companies—Tribune, Nexstar, Sinclair, Tegna, Gray, and Scripps—reported their political advertising revenue separately from other types of revenues in their Security and Exchange Commission filings. The companies reported a total of \$1.2 billion in

political advertising for the 2018 election year. The growth of political ad spending will offset the slower broadcast ad growth. Local advertising is an important source of revenue for the companies, and a majority of the revenue comes from area businesses, such as car dealerships and retailers. Because of the size and reach of both Nexstar and Sinclair, they will continue to remain lucrative.

Today, in 2020, Nexstar employs 1,800 salespeople. The goal of the company's sales force is extending their reach into digital content. Nexstar's websites and apps reach 36% of the U.S. Internet audiences, generating 1.1 billion-page views. The company employs 5,500 journalists, 121 local market websites, and 316 local media mobile applications. Utilizing their Publisher Solutions Group, they have created a content management system and audience development platform, to help their newsrooms publish multiplatform content.

In 2019, Nexstar launched HYFN, with offices located in Los Angeles and New York City, as the digital creative arm of the company developing business solutions for clients, with media strategies, data, and multichannel marketing ad placements. They have designed social campaigns for New Balance, TRX Training, and Macy's.

Nexstar Media Group trades on the NASDAQ Global Market under the symbol "NXST." Nexstar stock has grown from \$4.38 a share in the second quarter of 2010 to \$124.99 a share on February 6, 2020.

NIGERIA

Nigeria is one of the oldest nations in Africa to provide mass media to its citizens. Even before the arrival of newspapers, the people used numerous forms of traditional communication to disseminate news, information, and entertainment. During the colonial years (1901–1960), Nigeria became a pioneer for developing technology and structures for broadcasting and film in Africa. Although history and technology have changed the face of mass media in this country, there are a number of key issues surrounding journalism in Nigeria—several of which are discussed in this entry.

Print

Mass media in Nigeria began in 1859 with the publication of the first newspaper, *Iwe Iroyin* (*News Journal*) under the auspices of the Christian Missionary Society. Many other newspapers, both private and government-owned, followed including *The Nigerian Tribune* in 1949, currently the oldest surviving newspaper in the nation. Over the years, government-owned newspapers developed enormous readerships. But most of these papers are now either defunct or rarely appear on newsstands.

The press in Nigeria has faced its fair share of problems and challenges. Many newspaper owners play an influential role in determining editorial policies, sometimes resulting in biased news

coverage. Powerful advertisers have pressured journalists to alter news coverage, and claims of sensationalism and “fake news” abound. But the most damaging term that has been applied to Nigerian media professionals is *brown envelope journalism*—a reference to journalists who take bribes, sometimes accepting money wrapped in brown paper envelopes.

In 2020, there were 146 newspapers in Nigeria; 51 that operated both print and online, and 95 that were online only. Nigerians continue to keep up with print news, either directly or through “free readership,” a practice that began in the 1970s and continues today. What became known as the *Free Readers Club* consists of crowds of people who cannot afford to buy a paper and thus surround newsstands, talking to vendors and purchasers for hours about the news. Newspapers assign reporters to cover their opinions on important national, local, and regional issues.

Film

Films were first shown in Nigeria in the late 1800s in nickelodeon-type devices. They were projected on a screen for the first time in 1903 in the Clover Memorial Hall exhibition in Lagos. In the mid- and late 20th century, films played in cinemas in the big city, but reach was extended with “mobile cinema vans,” which brought movies to small villages without a theater.

The Colonial Film Unit was formed in 1939 to promote the British colonial agenda. Films were produced for and shipped to the various British colonies. In an effort to decentralize this process, the Nigerian Film Unit was established in 1949. The organization stayed under British control until 1965. In 1972, the government nationalized the theaters, resulting in the transfer of hundreds of movie houses to Nigerian control. Although these events occurred during the era of the civil war, the film industry remained relatively free of government oversight.

Between the 1970s and 1990s, film in Nigeria evolved into three industries: the Yoruba film industry, the Hausa film industry, and the Igbo film industry. The Yoruba film captured the spirit of the Yoruba traveling theater and indigenous stories. The Hausa film industry focused on

documentaries. The Igbo film industry, which it did not start as early as the other two, infused dramatic stories with aspects of the Igbo culture.

In the 1990s, the National Film Institute was established to train young people interested in working in the industry. At about the same time, the dawn of the “video film era” occurred when the Nigerian Television Authority began refusing to telecast the films of independent producers in the 1990s. So, producers began distributing their films directly via VHS tapes—signaling the arrival of the Nigerian home video industry—later coined Nollywood in 2002, a reference to the nicknames for the film industries in the United States and India (Hollywood and Bollywood, respectively). Today, Nollywood is currently ranked third behind Hollywood and Bollywood in global film production.

Radio and Television

The British Broadcasting Corporation (BBC) brought radio to Nigeria in 1932. Programming focused on countering anti-European ideas and promoting the British government. The BBC was key in providing propaganda messages during World War II.

The first original broadcast service in Nigeria was the Nigerian Broadcasting Service established in 1950 and overtaken in 1957 by the Nigerian Broadcasting Corporation. The network was based in Lagos with regional stations in Kaduna, Enugu, and Ibadan.

The Ordinance of 1956 provided a way for the regions to own their own broadcasting services; hence, the country witnessed the birth of regional broadcasting stations—the Western Nigerian Broadcasting Service in 1959, the Eastern Nigeria Broadcasting Service in 1960, and Radio Kaduna Television in 1962.

After independence, in 1962, the Voice of Nigeria was established with the aim to create national unity in the young nation, although the programs were broadcasted from London. Funding constraints made it necessary for broadcasters to rely on the government, which amounted to opportunities for government interference. In 1979, these regional networks became known as the *Federal Radio Corporation of Nigeria (FRCN)*. Today, the publicly funded FRCN claims to have

the largest radio network in Africa. Government regulation of radio persisted until 1993, when the industry was deregulated and privately owned stations began to appear.

In 2015, there were 265 radio stations in Nigeria—206 privately owned commercial stations, 59 government-run stations. By 2020, the number had risen to approximately 330.

The first television network in all of Africa was Western Nigerian Television (WNTV), established in 1959. WNTV was soon followed by the Eastern Nigerian Broadcasting Corporation Television in 1960. In 1962, both Radio Kaduna Television station and the federal government-backed Nigerian Television Service were established. The outbreak of the civil war in 1967 resulted in a split in these networks' allegiances. The radio and television stations in Eastern Nigeria supported the Biafrans who wanted to break free from the government, while the other regions supported the Nigerian government.

The civil war officially ended in 1970 and the federal military government established the Broadcasting Organization of Nigeria in 1973. By 1976, the government had taken over all television stations in the country and in 1977 established the Nigerian Television Authority, the only television broadcaster in Nigeria until 1993.

In 1992, the deregulation of the Nigerian broadcast industry brought with it the creation of the National Broadcasting Commission and the Nigerian Communications Commission. This move gave rise to many privately owned stations.

As of 2019, there were more than 30 independent and privately owned television stations in Nigeria.

Internet and Mobile Phone

The UNESCO-sponsored Regional Informatics Networks for Africa project in 1995 was the first attempt to introduce Internet service in Nigeria. By 1996, Link Serve became the first Internet service provider. This created opportunity for digital media—and greater access to the outside world. The introduction of the mobile phone in 2001 further accelerated the growth of digital media use in Nigeria. As of 2020, there were four major mobile phone networks operating in Nigeria, and over 400 licensed Internet service providers. These

services are virtually free from government restrictions, unlike the traditional media.

The Post Express was the first Nigerian newspaper to migrate its contents to the Internet in 1996. Others soon followed. Today, there are more online newspapers than print newspapers in Nigeria. Online newspapers produced by Nigerians in the diaspora have been widely accepted by Nigerians as a credible alternative to traditional media, which are more easily controlled by the government.

The introduction of social media platforms such as Facebook and Twitter gave rise to the important role of microbloggers. The 2011 election in Nigeria is an example of the influence of this new crop of journalists. To safeguard the electoral process, many young people and civil society activists took to social media to provide updates on the election in their communities. The Nigerian government has attempted to control such online voices through various activities, including blackmail, arrest, unlawful detention, attacks on the websites, and libel suits in the courts. These efforts continued in the ensuing years, resulting in a decline in Internet freedom.

In January 2019, around 24 million Nigerians were active Internet users of three leading social media platforms in the country: WhatsApp, Facebook, and Social/Hootsuite. Twitter and YouTube were close runners-up.

Nigeria has the highest number of Internet users in Africa. In 2018, the Federal Ministry of Communication announced that there were over 160 million mobile phone subscriptions and over 90 million mobile Internet subscriptions. According to the Nigerian Communications Commission, by July 2018, there were 122.7 million active Internet users who often used their cell or mobile phone to access the web, and they were usually young, educated, and urban. The high Internet penetration has provided a platform for digital and social media to thrive in Nigeria, and it has changed the way Nigerians utilize traditional media.

Key Issues in Nigerian Journalism

Journalism in Nigeria has been ongoing for a long time. While some aspects have developed, others may require more attention to maximize their usefulness. In this section, issues surrounding citizens

journalism, developmental journalism, women in journalism, and violence against journalist would be explored.

Citizen Journalism in Nigeria

Citizen journalism is produced when individuals create content, using various forms of technologies, that they then post online. The rate of such development is always tied to access to the Internet and cellular technologies. Today, many Nigerians can access the Internet even in rural communities if only by cell phone—although it is not as fast and efficient as in urban areas.

Citizen journalists have been unrelenting in their efforts to expose corruption in government, and the government has responded. In 2008, Jonathan Elendu became the first Nigerian citizen journalist to be arrested and accused of sponsoring a guerrilla news agency, as well as money laundering and sedition. The mainstream media did not report this arrest and have been reluctant to report others. Instead, such stories could be found at online news sites such as Sahara Reporters (saharareporters.com) and Pointblanknews (pointblanknews.com).

Despite the fact that citizen journalists have little to no formal training or professional editors, their work helps to set the agenda for the traditional Nigerian press.

The 2011 general election was a clear indication of the influence of citizen journalism. Initiatives such as ReclaimNaija, #NigeriaDecides, Vote or Quench, and Project 2011 Swift Count brought Nigerians together to monitor the election process to ensure that it was free and fair.

Development Journalism in Nigeria

Development journalism is a type of reporting that focuses on covering ideas, programs, and activities that center on improving the lives of people and communities. In Western nations, this community-based journalism typically addresses topics such as agriculture, family planning, and rural development.

The concept of development journalism is relatively new, and somewhat different in Nigeria. While development journalism in some societies may focus on scientific research, in Nigeria, it

focuses on activities like the commissioning of basic amenities such as paved roads, rural electricity, a potable water supply, sanitation services, adult education, and rural workforce development. These issues, which often affect disadvantaged members of the community, are generally underreported; and when they are reported, they tend to be published in niche columns, magazines, and journals.

Local communities have little control over reporting about their issues. Reporters typically travel from the cities to cover the occasional rural news story and return to the city. Government oversight, the low pay of journalists, and the costs involved in traveling to rural regions for stories have resulted in a limited amount of development journalism in Nigeria. The establishment of rural media channels in the 1970s and 1980s in communities in the states of Cross River, Kano, Plateau, and Niger was designed to increase coverage of rural activity and facilitate more journalists living in the communities. But journalists tended to remain in urban centers, where there were more, and perhaps more rewarding, opportunities.

Women in Journalism in Nigeria

In Nigeria, journalism is the domain of men. Although women began to enter the profession in the 1950s, they regularly face prejudice, stereotype, conscious bias, discrimination, and gender misrepresentation. Early female journalists primarily wrote about women's and domestic issues, but their roles have expanded. The first female editor of a national newspaper was Doyin Abiola in 1980. Forty years later, a number of women can be found in leadership roles in both print and broadcast journalism organizations.

To celebrate International Women's Day 2020, female reporters and news gatekeepers were honored by This Day Live for their contribution to the growth of journalism in Nigeria. More and more women are in Nigerian journalism schools, but the profession is still dominated by men.

Nonprofit organizations like Nigeria Association of Women Journalists and the Female Reporters' Leadership Programme (FRLP), the Wole Soyinka Center for Investigative Journalism (WSCIJ), and Free Press Unlimited have been making efforts to address gender inequality in the

journalism profession in Nigeria. FRLP was founded in 2017 and has supported and trained over 80 female reporters on reporting skills and tools to help them attain leadership roles in the various media organizations. The coordinator of WSCIJ attested to job demand, stereotypes, incompetence, and gender bias as factors responsible for the low number of women in the industry. In a 2017 survey by the Wole Soyinka Center for Investigative Journalism, among 85 media organizations in Nigeria, a ratio of male to female editors in the newsroom was found to be 9:1. To close this gap, more female journalists need to be trained. Those who participated in the training attested to being assertive in the newsroom and validated the knowledge acquired.

Violence Against Journalists in Nigeria

Violence against journalists is not a new phenomenon in Nigeria—there has been a long history of it from the early days of independence to the present day. The unleashing of security operatives on journalists has become a reoccurring situation. The State Security Service and the State Anti-Robbery Squad have been the major perpetrators of the violence on journalists, which range from arbitrary arrests, unlawful detentions, threats, physical and sexual assaults, tortures, and killings. Similarly, some civilians are engaging violence against journalists. There have been instances in which civilians have beaten up journalists, especially while covering protests. In 2017, there were reports of media outlets being invaded by civilians who tried to force the media outlets to broadcast their programs. Human Rights Watch in 2018 reported a trend of repression of freedom of expression and called on the government to stop unlawful detention of journalists. The U.S.-based Committee to Protect Journalists (CPJ) reported that during the 2019 general election, reporters were unable to perform their job in many states due to the threat of violence.

Reporters Without Borders or Reporters sans Frontières (RSF) has called Nigeria one of West Africa's most dangerous countries for journalists. The CPJ has called for the government to protect Nigerian journalists. In 2017, the Premium Times Centre for Investigative Journalism (PTCIJ)

released “Press Attack Nigeria,” a crowd mapping site designed to document and make public all types of harassment and violence toward journalists. Between 2016 and 2017, RSF registered more than 70 cases of violence against journalists and media outlets. CPJ has documented 11 journalists killed and as many as 13 at one time imprisoned since 1995.

NONPROFIT MEDIA

Nonprofit media organizations include those that provide content in a range of formats to serve the informational needs of the public. Nonprofit media include public broadcasting, or public radio and television, which are alternatives to commercial broadcasting. Nonprofit media organizations can also include public access channels, low-power FM stations, educational channels, government channels, and websites operated by nonprofit organizations. Nonprofit media can range from smaller community-based organizations to large-scale institutions such as the Associated Press, which is the nation's largest news wire service.

Distinguishing characteristics for nonprofit media include placing revenue back into the organization, exploring diverse social issues, having strong relationships and connections with the community, relying heavily on volunteers, applying strategies that appeal to listeners and viewers for support, creating partnerships with universities or local sponsors, and creating content to reach diverse audiences. By contrast, commercial

media are privately owned, often by corporations that own multiple media outlets, and make a profit through subscribers and/or advertising.

Nonprofit media typically obtain funding through private and public sources. In the United States, public broadcasting receives federal funding through the Corporation for Public Broadcasting (CPB). However, almost no nonprofit media in the United States obtain the majority of their funding from the government. Private sources can include grants and donations from corporations, foundations, universities, or individual subscribers. Notable nonprofit media include National Public Radio (NPR), Public Broadcasting Service (PBS), *National Geographic*, Associated Press, Cable-Satellite Public Affairs Network, and *Consumer Reports*. This entry discusses the history and revenue of nonprofit media, nonprofit radio and television, and the use of digital media for nonprofit journalism.

History and Revenue

Two historic moments are responsible for the creation of the public broadcasting system in the United States. In the 1930s, the Federal Communications Commission (FCC) began to reserve spectrum for noncommercial educational radio broadcast use. On November 7, 1967, President Lyndon B. Johnson signed the Public Broadcasting Act of 1967 into law. The law highlighted the importance of utilizing media platforms such as television and radio for “instructional, educational, and cultural purposes.” The law created the CPB, whose primary function was to ensure that federal funds were allocated to local public television and radio stations.

In 1970, the CPB established two nonprofit national networks that it continues to fund, NPR for radio and PBS for television. As a measure to ensure that CPB would not control any of the content on public broadcasting, it was forbidden from producing or distributing programs. The Public Broadcasting Act also stipulated that federal funds through the CPB are allocated based on distribution platform (TV or radio) and by a formula that determines how much money goes to stations themselves and how much is available for program producers. Approximately 67% of CPB funds go to television and about 22% to radio.

There are multiple sources of financial support for nonprofit media. For example, the Knight Foundation provided a \$2 million grant to New York City's WNYC in 2008 to create a morning news program. The Open Society Foundation awarded \$1.8 million in grants to NPR in 2010 for state news coverage. According to the FCC, approximately 14% of funding for public broadcasting comes from CPB.

To generate additional revenue, public broadcasters are permitted to sell show-related merchandise such as the licensing of children's show characters. However, public broadcasting is prohibited from marketing any products on air. Donations and subscriptions are also nonprofit media revenue streams. In some cases, individuals can donate funds to help finance a specific journalist's news story idea. Nonprofit media receive tax-deductible donations but they cannot generate funds by promises of profits or return on investments.

Nonprofit Radio

NPR is an American nonprofit membership media organization based in Washington, D.C., and is the largest employer of radio journalists in the United States. The public radio network distributes more than 100 hours of original programming weekly to over 1,000 public radio stations in the United States. NPR's two flagship shows, *Morning Edition* and *All Things Considered*, are among the most popular radio programs in the country.

Nonprofit radio can also include local news and public affairs programming, community-based stations, and college radio stations. A 2011 FCC report indicated that religious stations account for 42% of noncommercial radio stations. One of the largest Christian radio networks is Moody Radio, which is owned by the Moody Bible Institute.

Major nonprofit radio organizations are often well-staffed but medium to smaller organizations often have minimal staff. The amount of resources provided to major versus smaller organizations impacts the level of news coverage. For example, NPR has an investigative team that works with other field and beat reporters. They have also partnered with independent nonprofit organizations, such as the Center for Public Integrity, to

produce news stories covering topics such as sexual assault on college campuses. In recent years, nonprofit public radio has aimed to increase local news coverage.

Nonprofit Television

Public television focuses on producing educational programming to serve the public. In 1952, 242 television channels were reserved by the FCC for noncommercial educational television programming. In 1953, the first educational TV station to operate on a reserved channel was the University of Houston's KUHT. Other nonprofit television stations air instructional programming (e.g., university telecourses), popular programs (e.g., in-studio concerts), and award-winning poetry readings.

PBS a prominent nonprofit public television program distributor, broadcasts high-quality educational, news, and cultural content. Notable shows have included *Nova*, *Mister Rogers' Neighborhood*, and *Antique Roadshow*. PBS popularized educational children's programming with *Sesame Street*, which first aired in 1969, and in 1973 broadcast what is considered the first reality TV show in the United States, *An American Family*. PBS also created a wide range of programming topics such as public affairs, arts programming, historical documentaries, and science programming, and in 1972, was the first to establish closed captioning for the hearing impaired. In addition, the public broadcasting station WGBH created one of the most popular and longest-running weekly prime-time drama anthology series in television history, *Masterpiece Theatre*. Nonprofit television media can also include lower-cost public affairs shows on local cable stations. State Public Affairs Networks are also examples of nonprofit television media on local cable.

Nonprofit Media and Digital Era

Nonprofit media have adapted to the digital era. Some longtime nonprofit news organizations have launched news apps, such as the NPR One app that blends content from listeners' local public radio station with national news stories and podcasts. The early 2000s saw the launch of local and regional nonprofit news outlets such as Voice of

San Diego, MinnPost (Minneapolis), and The Texas Tribune. Columbia College's ChicagoTalks, a citywide news website, obtains a majority of its content from Columbia students. Nonprofit news organizations also have sprung up to provide news coverage in specialized sectors such as Kaiser Health News (health), Chalkbeat (education), the Pulitzer Center on Crisis Reporting (foreign news), and the Marshall Project (criminal justice). Other notable nonprofit news organizations include the investigative reporting organizations ProPublica and the Public Herald.

Demand for public interest news coverage remained strong in the 2010s as nonprofit media organizations continued to rapidly grow. Additional revenue streams further supported the growth of nonprofit media. In 2018, NewsMatch, a national matching-gift campaign for nonprofit newsrooms, supported approximately 155 nonprofit newsrooms, all of which were members of the Institute for Nonprofit News. NewsMatch also provides tools, education, and coaching for nonprofit newsrooms to thrive. According to the Institute for Nonprofit News, nonprofit news outlets brought in \$450 million in annual revenues in 2018.

NORTH AMERICA

Journalism in North America faced an existential crisis as a result of the rapid drop in advertising revenue that began during the 2008–2009 global recession and continued with the rise of Google and Facebook. This put in doubt the profitable transition of news delivery from print, radio, and television to digital media. The news business had been transformed by advertising from a craft practiced mostly by printers in the 18th century into a big business in the 19th century and one dominated by profit-driven corporations by the late 20th century. The rapid decrease in advertising thus reversed the evolutionary course of journalism from a commodity sold for profit back toward a craft practiced for civic purposes by smaller businesses. Alternatives to the profit-driven model for journalism were sought into the third decade of the 21st century. For example, in 2019 Canada moved to allow charitable donations to nonprofit news media, similar to that enabled in the United States under Section 501(c)(3) of the U.S. tax code, which provided a viable business model for some journalism websites. This entry examines the current status of journalism and reviews its evolution in each of the countries of North America: the United States, Canada, and Mexico.

Old and New Media in North America

The trend toward commercialization of news reached its height in the United States, whereas the news ecosystems of Canada and Mexico developed slightly differently as a result of political and cultural factors and were thus less dependent on advertising. Private ownership dominated broadcasting in the United States after it emerged in the 1920s, but Canada adopted a hybrid public-private model and state-controlled broadcasting dominated in Mexico until the 1990s. From its apex just after the millennium, however, the advertising “bubble” began to deflate because of widespread broadband Internet adoption and then burst with the so-called Great Recession. Most advertising fled legacy media such as newspapers and television, which hoped to replace it with digital advertising as they transitioned their operations online. Instead, Google and Facebook

dominated digital advertising, forcing legacy media to downsize rapidly as their revenues fell, leading to a loss of local reporting. In 2018, Canada became the first major world economy to subsidize journalism, funding a C\$50 million (US\$40 million) Local Journalism Initiative for underserved communities, which was followed the next year by a C\$595 million (US\$450 million) bailout of news media over 5 years.

The displacement of old media by new media, which was widely expected at the millennium, had not transpired a quarter century after the introduction of the World Wide Web, leaving journalism in a state of limbo. Online journalism proved unable to find a profitable business model for general news, although niche websites on specialized topics proved sustainable through subscription. Revenues from digital advertising were insufficient to sustain a newsroom of any substance, and online subscription schemes also failed at first to make up for lost legacy revenues. Experimentation continued, however, as the metered paywall introduced by *The New York Times* in 2011, which allowed readers a few free articles every month, was adopted widely in the United States and Canada. The persistence of old media and the inability of online journalism to find a sustainable business model thus made displacement of old media less likely as time passed, with accommodation of new media being the more likely outcome.

Journalism in the United States

The Revolution of 1776 that founded the United States of America saw press freedom enshrined as the First Amendment to the U.S. Constitution. A resulting libertarian model of the press, however, exposed the perils of unrestrained press freedom during the yellow journalism era at the end of the 19th century and was replaced with a so-called social responsibility model. American journalism proved central to national development first through trade and commerce and then through industrialization, important political and economic reforms, modernization, and finally globalization. It thus proved an exemplar for press systems worldwide and as the watchdog on power needed for democratic rule, as exemplified by the investigative reporting that drove Richard Nixon

to resign the presidency in 1974. Those aspects of journalism were not emulated as widely in other countries, whose rulers feared similar consequences.

American journalism was pivotal to the nation's establishment through revolution, as a vigorous colonial press fomented discontent with British rule, but it subsequently struggled to justify its practices and growing power, maturing through several phases of development. An early "party press" saw journalism focus on politics, with newspapers often founded as party organs. The growth of advertising saw newspapers increasingly abandon overt partisanship in a quest for the mass audience. This for-profit model of the press saw competition dwindle as publications merged or perished in a race for market leadership that usually left only one daily newspaper in a town or city.

Technology continually diminished America's press, as first radio and next television cut into its audiences, then the Internet threatened to extinguish it. Newspapers struggled to compete first with the immediacy brought by radio in the 1920s and then with the images that television added in the 1950s. Publishers responded with technological advances of their own, such as high-quality color printing and satellite transmission, which allowed national dailies to be printed in different parts of the country and even globally. Both were exemplified by *USA Today*, which was founded in 1982 by the Gannett newspaper chain. *USA Today* featured short stories and colorful graphics.

In the 1990s, online journalism, which allowed anyone with a computer and an Internet connection to publish on the World Wide Web, threatened mainstream media. This enabled so-called citizen journalists and bloggers to proliferate online while established news media struggled to adapt to the digital world. By allowing advertisers to reach customers directly online and then through social media such as Facebook, the Internet siphoned off much of the advertising revenue that once supported mainstream journalism. Mainstream media were forced to retrench, mostly by laying off journalists. After several long-publishing dailies folded or went online-only in 2009 and a dozen newspaper companies declared bankruptcy as a result of unsustainable debt, fears grew

that traditional journalism might die out. Newspapers survived after downsizing, however, and the chains all continued to publish under new ownership.

Politics returned to the fore with the 2016 election of Donald Trump to the presidency and the New York Times soon had more than 4 million online subscribers. The COVID-19 pandemic that began in 2020 brought a renewed financial crisis for journalism and revealed deep divisions in American society brought on by a partisanship which had been fanned by right-wing broadcasters and perhaps worsened by an Internet free-for-all. Whatever the news was, it seemed that journalism in America remained at the center of the story, as it had since the nation's founding.

From Politics to Profit

The press in the United States flourished under the freedom paradigm, with 178 weeklies and 24 dailies across the country by the end of the 18th century. The center of growth was New York City, which experienced a rapid population rise due to immigration from Europe. In the mid-19th century, however, costs began to escalate due to technology, and newspaper publishing was transformed into a big business. While it took only \$500 to establish the *New York Herald* in 1835, soon steam-driven presses and growing staffs inflated start-up costs for a daily to \$5,000–10,000 by 1840. Adding the expense of sending news by telegraph made the cost more like \$100,000 by 1850. Newsgathering expenses soared during the Civil War, and by 1870 the cost to start a daily newspaper was estimated at close to \$1 million. Despite this, the increased revenue flowing from advertising made it a booming business in most major cities. New York City alone boasted 19 dailies by the late 19th century in a so-called Golden Age of newspapers. The era of mass society saw cities swell, leading to the rise of mass marketing through department stores, which stimulated sales with advertising.

Cooperative newsgathering began in 1846 when five New York City dailies pooled their resources to cover the Mexican-American War by telegraph. This led to formation of the New York Associated Press, which merged with several rival news agencies in 1900 to form the Associated

Press as a nonprofit cooperative. The AP distributed stories from its member newspapers, and also opened a growing number of national and international bureaus.

Technology also transformed the structure of news writing, which began as a narrative or even chronological account. The telegraph led to stories instead being written in the inverted pyramid form, which was top-heavy with facts in case transmission was interrupted. This had the added benefit of allowing editors to cut stories from the bottom in order to fit on a page without losing the most important information.

In their quest for the widest possible audience, mass circulation dailies began to abandon the partisan politics on which the press in early America had thrived. Journalism became more professional as a result. Originally the province of printers, it evolved into an occupation practiced by reporters and editors. Educational levels of journalists increased and reporters grew in status when given bylines atop their articles. They gained expertise and contacts by increasingly work “beats,” which saw them cover one topic regularly, and they soon began to interrogate sources directly through interviewing. Journalism became a subject of higher education in the late 19th century, being taught first in college English departments before several freestanding journalism schools were established early in the 20th century.

Increasing Professionalism

The fin de siècle yellow journalism practiced by New York City publishers Joseph Pulitzer and William Randolph Hearst was a low point for American journalism, as their sensational—and often fictional—coverage of an insurgency in Cuba was blamed for starting the 1898 Spanish-American War. This type of discredited journalism in pursuit of profit was soon replaced by a more responsible brand of reporting as exemplified by *The New York Times*, which proved even more profitable. Stressing accuracy, decency, and conservatism, the *Times* attracted a wealthy readership by emphasizing business coverage. This elevated the informational model over the disgraced entertainment model of yellow journalism by relying more on advertisers for revenue than on readers.

The 20th century dawned with a hard-hitting brand of investigative reporting dubbed “muckraking.” Magazines such as *Collier’s Weekly*, *Cosmopolitan*, and *McClure’s Magazine* specializing in deeply researched exposés of social, political, and economic problems. Investigative journalism fueled reform in the Progressive Era of the early 20th century, which saw the first regulation of housing, food and drugs, monopolies, child labor, and working conditions. Muckraking died out in the 1910s, however, as a more conservative era saw readers grow weary of bad news. The demise of muckraking became complete with the outbreak in 1914 of World War I, which the United States joined in 1917.

Commercialization increased during the interwar years as broadcasting networks and newspaper chains grew, along with their political power. A private Commission on Freedom of the Press (also known as the *Hutchins Commission*) called for a more responsible and accountable form of journalism in its 1947 report titled *A Free and Responsible Press*. Newspapers largely rejected its findings and pointed out that the Hutchins Commission was made up almost entirely of academics and included no journalists. The new academic field of mass communication, which grew with postwar state universities, compared the social responsibility model it advocated for with the earlier authoritarian and libertarian models. Together with a Soviet Communist model then practiced in Eastern Bloc countries, these models were codified in the pioneering 1956 book *The Four Theories of the Press*.

Television returned the muckraking tradition with investigative programs such as *See It Now*, which was hosted on CBS by Edward R. Murrow in the 1950s and explored such issues as the exploitation of migrant farm workers. The most influential report by Murrow was on Senator Joseph McCarthy of Wisconsin, whose communist “witch hunts” Murrow exposed as a fraud. This cast serious doubt on the journalism ethic of objectivity, which McCarthy had exploited in promoting his claims of government infiltration by communists. Instead of simply reporting such claims, reporters increasingly began to investigate their substance in a more subjective “New Journalism” that emerged in the 1960s. Investigative journalism was boosted by programs such as *60*

Minutes, which CBS started in 1968 with the advent of color broadcasting and became the most popular show on television by the mid-1970s. Its success spawned imitators on NBC and CBS, then on the new Fox network, founded in the mid-1980s by Australian media mogul Rupert Murdoch.

Television evening news demonstrated the new medium’s power to influence public opinion by regularly broadcasting events such as civil rights protests and the Vietnam War. *CBS Evening News* host Walter Cronkite, who became known as “the most trusted man in America” for his fatherly tone, deemed the war in Vietnam a lost cause in an influential 1968 editorial. His nightly coverage in the early 1970s helped expose the Watergate scandal, which led to Nixon’s 1974 resignation. In 1980, with the advent of satellite transmission, Ted Turner founded the Cable News Network and headquartered it in Atlanta instead of New York or Los Angeles. With the growth of satellite broadcasting came a proliferation of news channels in the 1990s, such as MSNBC and Fox News, with the latter catering to an underserved market by appealing to conservative viewers.

Online Journalism

The introduction of the World Wide Web in the 1990s increased the fragmentation of news audiences, a phenomenon which had begun with radio and accelerated under television. The market for news that newspapers once monopolized now had to be shared four ways. Each new medium that emerged had forced existing media to adapt, but the digitization of news threatened to supplant all others. Under the theory of convergence, digital media were expected by some to replace print media, radio, and television because text, audio, and video could all be transmitted online. The new technology was also supposed to democratize journalism, as it allowed anyone to be a publisher without having to own a printing press or a broadcasting station. Websites such as the Drudge Report sprang up in the 1990s and covered politics in particular without the restraint of traditional news media, for example in reporting the indiscretions of President Bill Clinton. Mainstream journalists also found themselves unusually fact checked, such as when document experts

went online to cast doubt on a *60 Minutes* story in 2004 that claimed President George W. Bush had been AWOL from the Texas Air National Guard during the Vietnam War. Its producer was fired and presenter Dan Rather, who had succeeded Cronkite as host of the *CBS Evening News* in 1981, retired.

While online journalism disrupted old media, it did not replace them, at least not in the short term. As with all forms of media, the Internet proved to have both strengths and limitations, and gradually old media adapted. Online audiences proved elusive, with shorter attention spans that discouraged long-form journalism and encouraged short attention-grabbing items that became known as *click-bait*. The clicks they sought were the basis on which online advertising rates were set, but soon oversupply sent rates ever lower. Google and Facebook dominated online advertising, ironically by often circulating links to stories the mainstream media first reported. That left little to sustain journalism, including digital start-ups that struggled to find a profitable business model for general news. Newspapers soon rethought the wisdom of relying on digital advertising and increasingly began to charge for online access to their content. Again they had adapted to competition for news audiences brought by a new medium. Meanwhile, an alternative online journalism ecosystem was sustained by Section 501(c)(3) of the Income Tax Act, which allowed nonprofit institutions, including news organizations, to receive tax-deductible donations. This helped to fund local news websites such as MinnPost and the Voice of San Diego, as well as investigative reporting by websites such as the Texas Tribune and ProPublica.

Journalism in Canada

Differences in history and culture resulted in journalism evolving slightly differently in Canada than in the United States, with the main points of departure being bilingualism and public broadcasting. Canada was settled by colonists from both England and France, with the province of Quebec speaking mostly French while the rest of the country largely spoke English. The result was parallel cultures often referred to as *the two solitudes*. One important difference between the United States and Canada was in the

enshrinement of press freedom. While the First Amendment to the U.S. Constitution provided an absolute guarantee, the Canadian Charter of Rights and Freedoms enacted in 1982 balanced press freedom against the rights of identifiable groups not to be subjected to hate speech.

The press evolved in Canada much as in the United States, with newspapers serving first as political party organs and then as profit-driven businesses owned by chains, but the French-language press tended to be more overtly partisan. The first English-language chain was founded by printer William Southam, who published several Ontario dailies before expanding in the early 20th century into Western Canada. The Thomson chain was started by former radio salesman Roy Thomson, who began buying small newspapers in Ontario in the 1930s after he discovered how profitable they were. Thomson expanded his newspaper empire not just across Canada but into the United States and Great Britain, where he was named Lord Thomson of Fleet in 1964 after buying newspapers there including *The Scotsman* and *The Sunday Times*.

The Southam and Thomson chains came to so dominate Canadian newspapers that a Royal Commission was called in 1980 after they traded and closed two major dailies, creating new local monopolies for each other. The commission proposed a Canada Newspaper Act that would have placed limits on chain ownership, but none was enacted after a change in government. As a result, Canada has one of the world's highest levels of press ownership concentration. The Southam chain was taken over in the 1990s by Conrad Black, who founded the *National Post* in 1998 as a conservative competitor to Thomson's *The Globe and Mail*, which had published nationally by satellite since the early 1980s. Black sold Southam in 2000 to Canwest Global Communications, which owned the Global Television Network. Despite a warning by the Royal Commission on Newspapers against allowing cross-ownership of newspapers and television stations, which had resulted in a brief ban in the mid-1980s, Canada placed no limits on such ownership, which was prohibited in the United States and limited in other countries.

Prompted by the AOL–Time Warner merger in the United States in January 2000, the

convergence model of multimedia ownership began to sweep the country. Before the year ended, *The Globe and Mail* partnered with CTV, and the French-language chain Quebecor acquired the provincial network TVA. Canadian news media were devastated within a decade by convergence. Canwest Global declared bankruptcy in 2009 due to its unsustainable debt load while *The Globe and Mail* dissolved its partnership with CTV as unworkable the following year. Canwest Global was deconverged when its newspaper and television divisions were auctioned off separately. The former Southam newspapers were acquired by a consortium of U.S. hedge funds despite a limit of 25% on foreign ownership. They renamed the chain Postmedia Network and in 2014 also acquired Sun Media, the country's second-largest chain.

Broadcasting evolved in Canada as a hybrid public-private model under the influence of both its British heritage and its American neighbor. Private radio stations sprang up across the country in the 1920s, initially often owned by newspapers. Public broadcasting was first delegated to the Canadian National Railway before a Canadian Radio Broadcasting Commission (CRBC) was formed in 1932 and took over its network of stations. The CRBC was reorganized in 1936 as an arm's-length Crown corporation called the Canadian Broadcasting Corporation (CBC) modeled after the BBC. The CBC also served as the country's first broadcasting regulator before being replaced in 1958 by a Board of Broadcast Governors, which was later renamed the Canadian Radio-television and Telecommunications Commission. The CBC began a French-language radio service in 1937 and a television network in 1952. Licenses for private television stations were first awarded in 1960, and the following year eight of the new licensees formed the CTV network. Global Television was built into a third national network in the 1970s by Canwest.

In addition to deconverging Canadian media, the 2008–2009 recession reshaped television ownership, as all three private English-language networks were taken over by the country's highly profitable cable companies. The result was a degree of vertical integration between carriage companies and content providers that rivaled the country's stratospheric level of press ownership

concentration. Online journalism, which was touted to flourish under convergence, instead stalled in the absence of laws that allowed tax-deductible donations to nonprofit startups. In 2015, Postmedia merged the newsrooms of its duopoly dailies in four of the country's largest cities, prompting Parliamentary hearings that sat for more than a year. The report, issued in 2017, recommended government financial support for news media, among other measures. A package of Cdn\$595 million (US\$450 million) in subsidies over 5 years was included in the 2019 federal budget to assist print and online journalism in Canada.

Journalism in Mexico

The first printing press in North America was shipped to Mexico City from Spain by bishop Juan de Zumárraga in 1536. The *Gaceta de México* was established as a monthly in 1722 and ran mostly business and society news. The first daily newspaper in Mexico, the *Diario de México*, began publication in 1805, but censorship was imposed under Spanish rule. The press flourished after Mexico achieved independence in 1821, but the largest dailies came under the authoritarian control of generals and ruling elites until late in the 20th century. Newspapers proliferated in the hundreds, especially in Mexico City, but the largest dailies were controlled by oligarchs with close ties to the ruling party, *Partido Revolucionario Institucional* (PRI). It dominated Mexican politics in a de facto one-party system from the 1930s through the 1990s and was a regime characterized by institutional corruption. Newspapers depended on government advertising and subsidized newsprint, while journalists received commissions from selling ads and also took government kickbacks. Television was a state-run monopoly under Televisa for almost 50 years. As a result, Mexico suffered under the PRI's domination until the millennium.

A reappraisal of journalism practices began after an army massacre of student protestors in 1968, reporting on which was one-sided in favor of the regime. In 1976, after a purge at the largest progovernment daily *Excelsior* of top editors who proposed a more independent editorial stance, 150 journalists quit in protest. Some founded *Proceso*,

which has been the nation's premier political weekly ever since. Others founded the daily tabloid *Unomásuno* in 1977; several left in 1984 to form *La Jornada*, which became the voice of Mexico's antiregime left. Provincial newspapers also rose to prominence in the 1970s, including as *El Norte* in Monterrey, *El Sur* in Acapulco, and *Siglo 21* in Guadalajara. Younger and more professional, their journalists were forbidden from taking bribes or gifts from government officials. In the place of corruption, however, physical repression against journalists rose sharply, with about 60 Mexican journalists being murdered between 1980 and 1996.

Political liberalization combined with increased competition and professionalization of journalists to create more independent news coverage by the mid-1990s. The broadcasting sector also opened up with the founding in 1993 of TV Azteca as competition for Televisa. Aggressive talk-radio commentators competed for large audiences and advertising revenues. Economic reforms reduced government subsidies for proregime publications. Major news stories like the 1985 Mexico City earthquake and the 1992 Guadalajara gas explosion stimulated public interest in independent reporting. Television coverage, which no longer slavishly supported the PRI, played an important role in reshaping public opinion in favor of the opposition. A series of scandals, the armed insurrection in Chiapas, political assassinations, and the economic shock brought by the peso's devaluation in 1994 contributed to the opposition winning legislative elections in 1997. Political reforms ensured a more permissive environment for independent media, and in the presidential elections of 2000 opposition candidate Vicente Fox defeated the PRI.

Increased political independence for journalists has come at the price of their safety, however. Attacks on the press have accelerated in recent years, with 47 journalists murdered between 2012 and 2018. The human right organization ARTICLE 19 documented 544 attacks against Mexican journalists in 2018, including threats, harassment, intimidation, blocking of access, deprivation of liberty, 72 incidents of censorship, 65 physical attacks, and nine murders, with public officials being the chief perpetrators. It estimated the rate

of impunity for crimes against journalists in Mexico at 99.1%. A protection program for journalists introduced in 2012, which included the use of bodyguards, panic buttons, safehouses, camera systems, and bulletproof vehicles, was largely ineffective. In 2019, the International Federation of Journalists and the Committee to Protect Journalists declared Mexico the most dangerous country in the world for media workers, surpassing war-torn Syria. There were 10 murders of journalists in 2019, mostly by organized crime cartels. As a result, both Freedom House and Reporters Without Borders rated the country's press as not free.

OBITUARIES

An obituary (the root of the word is *obit*, Latin for “death”) is a news report of someone’s death, often with a biographical sketch of the deceased. Obituaries typically appear within days or a week after the subject has died. Usually appearing in a newspaper, an obituary not only announces the fact of the individual’s passing but also offers an account of the texture and significance of his or her life. An obituary differs from a death (or funeral) notice, which is a paid announcement of the death and funeral details written by family members and placed in a newspaper by either the family or the funeral home.

Origins

If one includes memorial walls and stones left to honor kings and heroes, the obituary dates back to ancient Egypt. In North America, the first obituaries that would be recognized as such by modern readers appeared in Boston newspapers as early as 1704. These early obituaries tended to be short, more like current death notices. Invention of the rotary press in the mid-19th century allowed newspapers space for more news and short death notices evolved into flowery obituaries.

In some of the newspapers for Richmond and Lynchburg, Virginia, for example, longer obituaries began appearing in the 1830s and 1840s, depending on the prominence of the person. These

would often list some of the details of the individual’s life, but they usually gave little family information other than naming a wife and mentioning—but not naming—children, plus brief details about funeral services. True obituaries listing such details as next of kin, cause of death, place of burial, funeral service information, and the deceased’s occupation and activities in civic and cultural groups seem to have first appeared in newspapers between 1875 and 1890, depending on the paper and its coverage area. As obituaries became more commonplace, so did the realization that many individuals had amazing life stories, and the practice of publishing obituaries for every member of at least smaller communities became expected of newspapers. Rather than being a “depressing public service,” obituaries are often among the most frequently and closely read sections of a newspaper.

Most 19th-century obituaries focused on a person’s character. By the 20th century, writers focused more on describing the accomplishments and associations of the deceased and dwelled less on their character. According to historian Nigel Starck (2005),

The obituary art in its first incarnation was practiced by the newsbook compilers of 17th century England . . . It flowered in the 18th century . . . it grew luxuriant, and sometimes ornate, in the 19th century; it became unfashionable and fell into widespread neglect in the 20th. Then, with the appointment of reformist editors, the obituary experienced its own restoration.

He also points out that some people in early America were excluded from the obituary notices, notably “those who were not white, not well off or not powerful. Also typically excluded were women and children.” This began to change in the 20th century as women and minorities took on a greater role in society.

Types and Process

Newspaper obituaries can be divided into two categories: news and feature. The news approach is a traditional news story that includes full name of the deceased, age or birth date, address or hometown, occupation, affiliations, significant accomplishments, survivors, and details of the memorial service. It may also note cause of death, education, military service, honors, and awards. Put another way, the news obituary sums up the life, usually centering on a person’s most noteworthy accomplishments or activities.

Most community newspapers run at least a short item on every death in town. “In community journalism, the writing of obits is one of the most important things we do,” says James A. Raykie Jr., editor of *The Herald* in Sharon, Pennsylvania (quoted in Scanlon, 2003). The paper publishes about 2,000 obituaries a year, most written by a full-time obit writer assisted by other reporters and newsroom assistants on days when local deaths exceed an average of nine. The paper learned just how important obituaries are to readers when a 1988 redesign moved these from the front to the back page; reader complaints prompted the paper to go back to front-page stories. In larger cities, where 50 or more people die daily, newspapers will run an obituary for only a handful.

The famous and infamous usually rate a “feature” obituary; the basic information is fleshed out with personal insights, including anecdotes, descriptions, quotes, and reminiscences. A feature obituary attempts to provide a fuller account of the texture as well as significance of the life of someone who has died. *New Yorker* writer Mark Singer offered this elegant definition of the feature obituary: a “completed cycle of accomplishment or notoriety, concisely wrought” (2002, p. 28). Feature obituaries include more quotations (from

both the subject and others) and more extensive biographies than news obituaries. Interviews with survivors and friends often turn up interesting material. Incidents in the person’s life that are well-known to the public are included in the obituary, but it is the lesser-known events that raise the feature obituary to an art form.

Although feature obituaries are usually limited to prominent people, a new form—dubbed the “common man” (and woman) feature obit—emerged in the 1980s. At the *Philadelphia Daily News*, former investigative reporter Jim Nicholson won numerous awards for his feature obituaries, including the American Society of Newspaper Editors’ first obituary writing award in 1987, for his sensitive portrayals of the lives and deaths of ordinary men and women, in the process earning the nickname “Dr. Death.” In his work, we found out that Marie Byrne smacked her kids for “making the nuns upset” and that she had a “private prayer list with countless people on it.” We learned that John Ciavardone, “skinny as a lead pencil,” cried only once over his terrible war injuries and referred to his friend, Mickey DiSanto, as his seeing-eye dog, his “canine.” The astonishing body of Dr. Death’s work also proves that “news is culture” and that an important role of journalism is to chronicle the achievements, failures, rhythms, and rites of passage of one person’s life.

The Associated Press keeps 1,000 “biographical sketches” of prominent people on hand, frequently updated. *The New York Times* has 1,200 on file. A community newspaper, depending on its size, may have a similar file about prominent people in town. When a well-known person dies, the background, or “B-Matter,” is ready so that all the reporter need write is an obit lead and the funeral arrangements. At many newspapers, obit files are compiled on the most prominent people while still alive, which allows the newspaper to run an obituary promptly and with considerable detail. The practice has led, on rare occasion, to premature obituaries being published mistakenly. Unsubstantiated reports of the death of a prominent person can induce a harried editor, facing tight deadlines or seeking to scoop the competition, to print one of these ready-to-run obituaries. One famous instance of this was for Mark Twain, published in the *New York Journal* in 1897, to

which he commented, “the reports of my death are greatly exaggerated.” (He died in 1910.)

New print reporters are often inducted into the profession by a stint of obituary writing because it stresses the need for accuracy in reporting names and dates and his or her ability to work under pressure—people are always dying on deadline. As Jock Lauterer writes, “It’s a mortal fact lost on many young reporters: The older people become, the more they pay attention to obituaries. And the enduring irony is that many young reporters are required to write ‘obits’” (2006, p. 113). It is a test—of accuracy, humility, enterprise, and journalistic craft—and for many novice journalists a rite of passage. Some beginners consider obituary writing a dull assignment of little importance. “What nonsense. What an opportunity,” says Joseph Galloway, a senior writer for *U.S. News & World Report*, who wrote his share of obituaries when he broke into newspaper work at a small Texas daily.

The obituary has come to be held in such regard that in 1999, the International Association of Obituarists was formed. Along with holding international writers’ conferences, seminars, and workshops, the organization seeks to enhance public and professional appreciation for the art of obituary writing, to generate educational activities related to obituary writing, and to serve as an advocate for the craft. Its educational branch also responds to research requests from scholars in the fields of journalism, history, genealogy, and anthropology. Finally, the association honors distinguished efforts in writing obituaries with a series of awards and an annual recognition program.

Obituaries, more than most items in a newspaper, speak directly to journalism as the “first draft of history.” Obits are as significant to the present community as to posterity, as much about ourselves as about the deceased.

OBJECTIVITY

Objectivity, loosely defined in the context of journalism as impartial, detached reporting based on verifiable data, is widely understood to be the goal of many news organizations. Many argue that objectivity is a belief for journalists and the cornerstone of professionalization in liberal media systems. In those contexts, it is often central to journalism training and how journalists situate themselves in their role of mediator between newsmakers and the general public. It can be an effective defense to assure the public that journalists act ethically and for the greater good, rather than for personal motivations or societal elites. Yet, how objectivity is enacted daily by thousands of journalists around the world does not always meet those ideals.

Members of the public sphere, ranging from elites to average citizens, sometimes claim media bias as a way of discrediting journalism. It seems simple to do because while objectivity is a routinized journalistic norm, its tenet of producing value-free news is fundamentally flawed. This is because news personnel are limited by their own ideologies and selected realities.

There are also structural flaws in news organizations and greater inequalities of societal structures that influence the news process. To add to the complication, those in the public criticizing news bias are often motivated by their personal biases. Therefore, achieving total objectivity and the reputation of objectivity in news is nearly impossible. Nevertheless, objectivity continues to dominate journalism because associated with it are professional routines that structure news reporting, inform ethical standards in journalism, and help maintain journalism as a fourth estate and invaluable part of society.

Many working in the news industry acknowledge objectivity is more of a construct than a universal truth. To address its importance and challenges to journalism, this entry further defines objectivity, then discusses how it has evolved in journalism practices in both the United States and around the world, and why it is often criticized but still practiced.

Defining Objectivity

Since objectivity is central to liberal journalism found in places such as the United Kingdom, Canada, and the United States, it is often associated as a primary definer of professionalism in journalism. Yet, objectivity is not necessarily emphasized in other contexts where professional journalism standards exist. Furthermore, perceptions of objectivity can differ according to geographical location, and other factors such as political ideology, experience, and age. Previous research shows most journalists are aware of objectivity and use its associated norms such as direct quotes, multiple viewpoints, and separating facts and opinions, but also use other approaches such as interpretation and pluralism. Consequently, though objectivity is largely associated with the United States and United Kingdom, it is important to note that objectivity as a professional journalistic norm is common but not always stressed in other contexts.

Several scholars over the years have tried to define objectivity in the news. Some of the first journalism texts from the late 19th and early 20th centuries did not use the term objectivity per se, but emphasized fact-based news reporting.

Objectivity evolved to be loosely defined as impartial, detached reporting based on verifiable data. According to David Mindich, the following values are commonly associated with objective reporting: detachment, nonpartisanship, inverted pyramid style, naïve empiricism, and balance.

Detachment is the process of reporting without emotion or personal opinions. *Nonpartisanship* is presenting both sides of a story. The *inverted pyramid* is a writing style where important facts are reported first. *Naïve empiricism* involves relying on facts in order to report the truth accurately. Finally, *balance* is reporting positions equally without preference to a side.

These objective values have associated benefits and critiques. It's seen as professional to remain distant from the story. But, some question whether it is possible to have complete detachment in reporting and argue that the perspectives of journalists and news organizations influence how facts are reported. Critical scholars note that so-called value free news often reflects a status quo rather than varied perspectives. In particular, marginalized populations are overlooked in the news. Furthermore, when reporting on tragedies and various inequalities, objectivity can fall short of humanity if it fails to convey emotion. Journalists' stoicism has at times been admired as courageous but also critiqued as lacking empathy.

Nonpartisanship plays an important role in informing the public of politics, especially during election time. In the last two decades, however, the partisan press have impacted the entire news industry—decreasing the public's trust in news media and their growing concerns that all news media are somehow biased. The inverted pyramid helps journalists organize the main points of a story, but can unfairly place emphasis on certain points and overlook others.

Naïve empiricism is central to why journalism is still regarded as fundamental to democracies, and important sources can exploit that by spreading false information through use of direct quotes. For instance, during the presidency of Donald Trump many journalists spent considerable time fact checking false statements he made via interviews, tweets, and his rallies. Reporting truth accurately is thus strained. Finally, balance is often simplified to dualism, or telling two sides to a story. This oversimplifies complex issues, and

oftentimes journalists focus more on one particular side of the story.

Despite the commonly understood limitations of objectivity as an abstract concept, it has also developed as a blueprint that simplifies the job for journalists while also protecting news organizations. According to Gaye Tuchman, objectivity can be defined through form, content, and organizational relationships. Firstly, form comprises ritualized routines journalists follow as defense mechanisms against lawsuits and to maintain credibility. Specifically, objectivity routines are presenting conflicting viewpoints, including supporting evidence for claims, direct quotes from sources, and the inverted pyramid. Content production through the objectivity lens is done through constructed realities of what is supposed as journalistic instincts or common sense.

This process is known as *gatekeeping* in journalism and has long been based on what the gatekeeper judges to be newsworthy. There is both high trust and critique in this process. On one hand, training and work experience do qualify journalists to anticipate the level of interest the public may have in a story. On the other hand, this process is not scientific and personal and organizational biases can influence the gatekeeping process. This same subjectively objective process continues through a newsworthiness evaluation process called *news values*.

News values have evolved and differ depending on context, medium, and market, but generally include impact, frequency, negativity, celebrity, timeliness, proximity, familiarity, and human interest. News professionals' evaluations of news on these measures may not reflect the entire scope of society. This is most apparent in newsrooms that lack diversity and consequently differing experiences and viewpoints.

Finally, interorganizational relationships include the situatedness of journalists in relation to influential external players such as politicians or CEOs, but also, the stance of their own news organization. The connections news organizations have with other societal elites can influence the form of objectivity. Journalists must balance building their networks of trust with elites such as politicians while still maintaining professional detachment. The rise of a partisan press in the 21st century via cable and online sources has

blurred the lines between the news industry and society's most elite, especially politicians. Consequences include a decrease of watchdog journalism, politicians' increased hostility toward journalists who they perceive are not politically aligned with them, and limits on journalists' access to politicians if they are perceived to be critical.

Journalism is in constant flux and adapts to changing economic, social, political, and technological advancements in societies. This influences how objectivity is perceived and practiced. However, news organizations that still heavily focus on objective reporting continue to function as elite opinion leaders for gathering and producing news today. The continued importance of traditional news reporting makes objectivity still relevant in journalism.

The Evolution of Objectivity

Documenting the evolution of objectivity has not been a straightforward process. Before being adopted into journalism, objectivity was a well-established norm in science and philosophy. Furthermore, several developments have led to current understandings of objectivity. In England and across Europe, the number of news publications increased significantly in the 18th century, along with the formation of a public sphere interested in politics and culture—inspiring the evolution of both partisan and spectator journalism. Concerned with the growing influence of newspapers, however, the United Kingdom introduced the Stamp Act of 1712, which taxed newspapers (abolished in 1836).

When the pauper press began in the United Kingdom in the early to mid-1800s, publications concentrated on human interest stories that catered to a working class. But, in order to compete financially with the already established press, the pauper press needed to attract advertisers. Advertisers were less inclined to support publications with extreme or partisan views. Advertisers also sought page placement near stories accommodating the upper classes. As a consequence, newspapers became less opinionated and ignored non-elite perspectives.

In the U.S. context, Michael Schudson's work chronicles objectivity over several decades. By the

early 19th century, U.S. newspapers were relatively costly at six cents, produced by a small staff with few reporters, sold by subscription, dominated by advertisements and shipping news, often transparently partisan (even sometimes owned by political parties), did not separate facts and editorials, catered to business and political elites, and had low circulations. However, things changed in 1833 when Benjamin Day founded *The Sun* in New York City. He sold copies for one cent, which widened the audience from mostly elites to a larger working-class population. This started what became known as *the penny press*—similar to the pauper press in the United Kingdom.

The penny press quickly became popular with the public. Others followed suit, such as James Gordon Bennett, who founded *The Herald* in 1835, and Henry J. Raymond and George Jones, who founded *The New York Times* in 1851. The increased competition and audience readership changed newspapers, and in particular began to emphasize a timely newsgathering process. Scoops and circulating information quickly became a priority. Penny publications were sold on the street and included what were deemed as sensationalist news stories on crime and other previously ignored beats.

Schudson's work on how the norm of objectivity formed during the 19th century and early 20th century challenges notions that the invention of technologies such as the telegraph in the 1840s and the establishment of the Associated Press mandated objective reporting. He points to other developments such as steam powered printing presses and paper manufacturing as being critical to aiding the penny press's circulation and success. Indeed, penny publications were often early adopters of technology, which greatly aided their financial success.

Other scholars have also focused on the importance of the penny press and objectivity. Notably, Dan Schiller's work emphasizes the audience in the development of objectivity in the 1800s. He notes that the penny press appropriated a diminishing labor press that sought to bring knowledge to the working class about their rights and systemic injustices. The labor press aimed at empowering lower income earners. The penny press targeted the same emerging working class's interests, but through impartial reporting of facts in

order to increase circulation to a wider audience. Nevertheless, by reporting on issues such as crime, the penny press did continue to challenge societal elites. The evolution of the penny press reflected egalitarian values. Furthermore, it corresponded with scientific theories that promoted neutrality.

During the early 20th century, publications changed to a scientific approach to informational reporting, putting great emphasis on relegating opinions to editorial pages and not taking sides in news copy. However, wartime propaganda and an increase of public relations during and post-World War I impacted journalists and scholars' trust in naïve empiricism. This led to increased awareness of constructed realities of news, and that news and truth were not always interchangeable. It was during this time that scholars also first began to test media effects of propaganda's messages on audiences, with mixed results. To counter these concerns, there was increased use of journalistic routines such as a standardized writing style, source use, verification, news formatting (separating opinion from factual reporting), detachment, and balance.

Mark Brewin has identified four distinct periods of objectivity during the mid to late 20th century. Firstly, after World War II and leading into the 1950s, objectivity was solidified as a moral code for journalists. It was then objectivity became a belief and not just a way of selling more newspapers. There was trust in social institutions and knowledge creation was highly valued. Mainstream news organizations prospered economically and TV was popularized.

This shifted in the 1960s when objectivity was questioned. Many events such as the Vietnam War, the Cold War, and civil rights movements for equality based on race, gender, class, and sexualities challenged the status quo and trust in societal systems. Critics pointed to objectivity as commercially motivated to serve wide audiences and advertisers rather than the noble pursuit of truth. Furthermore, objectivity served to distance journalists away from marginalized groups to align with the elite. This was especially true in terms of who was interviewed and directly quoted in news coverage.

Challenging the status quo meant including non-elite voices and their stories. Schudson describes this shift as Objectivity 2.0. This more

critical form of news reporting provided interpretation for news events and relied on background information rather than episodic facts only. Journalists began to be more critical of politicians during this time. Importantly, Objectivity 2.0 didn't replace the standard norms of objectivity, or Objectivity 1.0, and consequently both continue in news coverage.

In the 1980s, scholars noted that neutral news reporting over some decades diminished passionate public responses that were invoked through partisan news. There was a growing apathetic audience whose trust in the news was diminishing. In response, public journalism in the 1990s called on journalists to take on the role of activist rather than passive spectator.

Finally, the late 1990s began a post-objective era. Emerging digital technologies gave way to news blogs and other online content that weren't necessarily concerned with objectivity. Furthermore, the popularity of partisan cable news channels such as Fox News changed the entire format and content of television news. The goal of the partisan press was to promote specific political viewpoints; nonetheless, because objectivity was so much ingrained in the concept of U.S. journalism, some of these partisan news sources were able to become mainstream through the guise of being objective.

Journalists continue to grapple with changing boundaries around what is considered to be news and the need to compete against popular alternative media. During the 2016 U.S. presidential election, public awareness of mis- and disinformation, commonly called *fake news*, also emerged as a growing threat to journalism and public consumption of news. The popularity of nonobjective news, particularly with conservatives, challenges the validity of objectivity in news and greater public discussions.

Further Challenges of Objectivity

There are several contributing factors that limit the realization of objectivity. Universally, accepted is the understanding that journalists, like all people, have personal biases. Several studies show that personal demographics such as gender, race, education, geographic origin, socioeconomic status, and political ideology influence journalists in

various aspects of their job. This includes story topics covered, sources used, frames emphasized, and professional behavior and status.

At the time journalistic standards developed, men dominated the journalism industry. In Western and colonized societies, racial inequalities also excluded non-white people from fully participating in the news industry. Those from lower socioeconomic statuses, LGBTQ people, and people with disabilities also were excluded from full participation. This has resulted in constructed realities in journalism being primarily from one category of person, rather than representing the entirety of societies.

Furthermore, the social control brought about through objectivity norms limits journalists' ability to challenge the status quo both within news organizations and in the greater society. Those attempting to challenge the status quo are often quickly overpowered by societal elites, such as politicians. Moreover, elites are able to control media narratives to promote their own agendas and discredit dissenting voices. Too often journalists quote powerful elites without challenging their claims. When journalists do challenge elites' claims, they still give a platform to elites. One prominent example in the 21st century is how the administration of U.S. President George W. Bush and the cabinet of Prime Minister Tony Blair in the United Kingdom promoted an invasion of Iraq after the terrorist attacks of September 11, 2001. The politicians' messages were prominent in news coverage leading up to the invasion in March 2003, and their justifications for going to war with Iraq were not sufficiently challenged by journalists.

Sandrine Boudana offers responses to four major obstacles in objectivity to illustrate that the challenges are not insurmountable. First, she argues that political attitudes do not have a strong impact on news writing according to research on journalism students, implying that journalists, or at least journalists in training, do have the ability to put aside personal political ideologies for the job. Second, organizational factors that limit an individual's influence can be countered by hiring a more diverse staff with varied perspectives. This would provide more accountability in the newsroom and drive more wide-ranging news content. Third, socially constructed realities can be

expanded if journalists are able to “transcend” their own condition to account for others. Fourth, the problem of language, or shifting connotations of particular words, can be addressed by accepting that objectivity is not neutrality or balance, but rather a “consensus-reaching” process of writing accurately and fairly.

Other scholars have proposed alternatives to objectivity. For instance, media transparency, contextual journalism, and feminist standpoint epistemology have all been suggested additions or even replacements to the current norms driven by objectivity. As the name denotes, transparency promotes the process of journalists disclosing possible conflicts of interest instead of insisting on detachment, which some argue is never fully attained. It also puts responsibility on journalists to explain their decision-making process to the public. Contextual journalism seriously began with Objectivity 2.0 in the mid-20th century when journalists shifted from primarily reporting news events episodically, to providing background and other relevant information in the news coverage. Feminist standpoint epistemology claims that journalists’ knowledge is situated, and so journalists must self-reflect and begin their reporting through voices of the marginalized rather than societal elites.

Journalists and scholars are likely to continue to debate objectivity’s ethical implications and relevance for as long as journalism exists in its current form. However, since the norms of news-gathering and production are based on objectivity, it remains a practical operational tool for journalists to do their jobs—even when they acknowledge objectivity is a flawed concept.

OMBUDSMAN

In the United States, the press is often referred to as *the fourth estate* because, in theory, it acts as a watchdog of government. Yet the press itself needs a watchdog. Scholars have argued that journalism in a democracy remains answerable to media accountability systems. Due to its role in a democracy, the government cannot have the power to hold journalism accountable, so the press must do it for themselves; the media must have a strong sense of self-regulation.

There are numerous protocols and manners through which journalism holds itself accountable: codes of ethics, press councils, trade journals, social media posts, and, most saliently for this entry, ombudsmen. All together, these form media accountability systems, which have the goal of improving the services of media, restoring the credibility of the media in the eyes of the populace, protecting freedom of speech and press, and, lastly, maintaining the journalism profession’s autonomy that it needs to assist in the expansion of democracy. Indeed, the media hold itself accountable through a mix of innumerable practices that signal to actors inside and outside of the profession that the industry deserves credibility and will hold itself accountable. Since the mid-20th century, one of the most visible ways the industry has held itself

responsible is through the employ of ombudsmen or public editors. This entry discusses the history of these positions in American news organizations, their roles, and the elimination of these positions in many newsrooms.

The History of Ombudsmen in the Newsroom

The term ombudsman is believed to have been invented when a Swedish organization argued that the country's government should be required to have on staff an independent investigator dedicated to exploring potential cases of malfeasance; this independent employee would serve at the behest of the public and not the government itself through they would be paid directly by the government. It was not until 1967, when a *New York Times* editorial writer named A. H. Rankin penned a persuasive column, that the idea of an ombudsman in the newsroom was conceptualized. Rankin contended that newsrooms needed to be held accountable and since the public did not have the means to do it themselves, the news organization itself should hire someone to serve as the voice of the public. Only a handful of weeks after Rankin's powerful editorial ran in the *Times*, the editor of the *Louisville Courier-Journal* in Kentucky hired the first newspaper ombudsman in the United States.

Less than a decade after the first ombudsman started his job in Louisville, newspapers across the United States hired more than three dozen more. The most clear and obvious role of ombudsmen is to act as the representative of the people. The position requires its holder to aim for increased accountability of the newsroom and catalyzation of more transparent and ethical journalistic practice. Ostensibly, ombudsmen accomplish this goal by publishing columns admitting to the news organizations' mistakes, explaining why mistakes happened, and detailing protocols that will be established to avoid making the same mistake again.

By serving as an intermediary between the public and journalists, an ombudsman can interview relevant journalists about newsroom issues and coverage and relay that information to the public in a transparent manner. In a sense, ombudsmen, especially early ones, took on the role of

press critic before recent technological advances allowed the public to criticize news organizations online. Ombudsmen often dedicated columns to uncovering organizational mistakes, mishaps, and violations of journalistic practice. Early research into ombudsmen found that readers believed the most important role of the position was to publicly serve as a media critic and provide transparent coverage to citizens.

The Roles of Ombudsmen

While the main outward role of ombudsmen remains acting as a media critic by advocating publicly on behalf of the reader, there are other more implicit roles to the position. By acting as a conduit to the public, the ombudsman can help a newsroom understand what type of journalism citizens place the value upon. They can communicate with the public in a manner that reporters traditionally do not simply because readers believe the ombudsman is one of them, in a sense. However, ombudsmen also enact a public relations role for a news organization.

One could argue that an ombudsman is the chief public relations executive for a newsroom. This role, as a de facto public relations officer, has been called the *single most important part of the job* because it allows the organization to "give readers a sense that the newspaper cares about them" (Ettema & Glasser, 1987, p. 7). By consistently publishing material concerning what the news organization is supposed to do—and material detailing the positive practices of the organization—the ombudsman position, very clearly, provides the public with a specific idealized image of the news company. Consequently, much past research elucidates that in their position many ombudsmen do take on the role of media critic concerning the individual journalists of an organization, but they seldom do the same for the organization itself; in fact, the position frequently publishes content that highlights the positives done by a news organization. Also, because people in the ombudsman role tend to be journalists themselves, they implicitly favor the institution of journalism and preach its benefits. Hence, they are very clearly advocating on behalf of the organization, the same thing as a public relations professional would do.

Another implicit role of the ombudsman is to work as a quasi-media-literacy teacher. By consistently publishing material that takes readers behind the scenes of how journalists do their jobs, ombudsmen effectively teach the public about the practice of journalism and what are and are not normative procedures. For example, by highlighting in a column when a journalist commits a misstep, the ombudsman is essentially lecturing the public on what the mistake was, why it happened, and what could have prevented it. More specifically, in 2013, the sports network ESPN partnered with PBS's *Frontline* investigative journalism program on a documentary called *League of Denial: The NFL's Concussion Crisis*. ESPN's reporters conducted many of the interviews and much of the research for the program, but, very close to air date, ESPN pulled its brand of the documentary. Soon after, it was learned that the sports network likely did this due to pressure from the National Football League, a partner of ESPN as the sports network broadcasts the NFL's *Monday Night Football*. Through primarily social media, the public—and other journalistic outlets—loudly and consistently criticized ESPN's decision. The network's ombudsman at the time—veteran journalist and former *New York Times* reporter Robert Lipsyte—devoted several columns to explaining to the public what happened, why ESPN did what it did and, most specifically, criticizing the network for violating journalism ethics. These columns effectively taught the public about normative journalism practices and ethics and helped them understand what happened.

Ombudsmen in Today's Media

Since 2010, the number of ombudsmen—or public editors as some news organizations more recently dubbed them—working in newsrooms has fallen dramatically. This seemingly is at odds with recent developments in the industry as the public's trust in journalism is falling and the need for a bond with citizens is stronger than ever. For example, after the discovery in 2003 that reporter Jayson Blair had fabricated numerous stories in *The New York Times*, the newspaper instituted a public editor position as a means of earning trust and credibility with its audience after such a high-profile scandal and breach of normative

journalism practices. *The New York Times* eliminated the position of public editor in May of 2017 even though it still struggles to earn the public's trust due to the Blair scandal and numerous other prominent ethical incidents. Scholars have argued that instead of eliminating the position, ombudsmen should obtain more power within a newsroom, such as the ability to censure or fire employees who do not abide by the norms of the industry. Others have contended that the position should be given to actual citizens on a rotating basis, but that could also defeat the purpose of the ombudsman since a layman could not take on the teacher role effectively.

Most news organizations that have eliminated the position of ombudsman argue that it is no longer needed, as the public no longer needs a voice since it can disseminate its opinions through social media, comments sections, emails, and other digital tools. Effectively, news organizations implicitly argue, these are the new elements of 21st-century media accountability system. However, an ombudsman works within a news organization and can hold employees accountable by essentially forcing them to explain themselves on the record. The ombudsman can theoretically sit outside an editor's office until they speak about a situation. The public cannot accomplish this. An ombudsman who excels at their job can enact all of the different roles of the position—unlike the public—and “they can do it in a way that can both hold journalism accountable to the public, but also effectively defend and describe a journalistic situation that an uninformed reader might not understand” (Ferrucci, 2019, p. 302).

OP-ED PAGE

“Op-ed” is abbreviated from “opposite editorial” due to the tradition of newspapers placing opinion material on the page opposite the editorial page. In a broadsheet newspaper, the editorial section is typically published on one or two pages of the first news section of the newspaper that display the masthead, which includes the title, owner's name, and staff listing of the newspaper. The section also includes between one and four editorials, syndicated and local guest writers, political cartoons, and letters to the editor. While the editorial page usually contains the opinions of the publisher, the op-ed page is reserved for articles by other writers who are often not affiliated with the paper.

Op-ed articles may come from freelance writers, advocacy and industry groups, public relations agencies, and others. Over time, the term

op-ed itself has evolved into an adjective denoting all opinion aspects of newspapers, such that some use the term to mean “opinion/editorial” rather than “opposite editorial.” Some of the most prominent op-ed pages are those of *The New York Times*, *The Washington Post*, *USA Today*, and *The Wall Street Journal*. This entry first discusses the form and purpose of op-ed essays and the development of the op-ed page in U.S. newspapers. It then looks at the purpose and structure of the op-ed page and challenges facing op-ed editors.

The Essay

The op-ed essay itself is a short essay intending to inform the public about an issue and to indicate some means for its resolution. Many op-ed essays tend to follow one basic structure: lead (around a news hook), thesis (statement of argument—either explicit or implied), argument based on evidence (such as statistics, news, reports from credible organizations, expert quotes, scholarship, history, firsthand experience), a “to be sure” paragraph (in which the author preempts potential critics by acknowledging any flaws in the argument and addresses any obvious counterarguments), and the conclusion (often circling back to the author's lead).

Frank Partsch, who served as editorial page editor of the *Omaha World-Herald* from 1982–2003, argued that the op-ed page has a primary duty to provide opinions not ordinarily found on the editorial page. Secondly, it provides a variety of opinions selected as being, in the editors' judgment, useful to readers. Often, these come from a regular lineup of syndicated columnists—columnists with a following that limit the editors' ability to cut them to make room for more nonregulars.

Vying for the remaining handful of slots on the op-ed page are unsolicited articles, which increased in the 1990s with the wider use of fax machines and e-mail. According to some editors, a rebuttal by a person or institution criticized in an editorial gets top priority. An article by a public official going behind or beyond the news is usually picked up. Editors also look for scholarly analysis of public policy and infrequent pieces in which a regular reader finds a fresh and creative voice and deals authoritatively with an issue worthy of general reader attention.

Development

The American model of journalistic objectivity is a fairly recent development, predated by the partisan press and interspersed with various reactionary movements, such as new journalism (1960–1970s) and public journalism (1990s). During the partisan press era in the United States, news organizations aligned themselves politically and presented news from a specific partisan point of view, without the guise of objectivity. But since roughly the 1940s, mainstream U.S. newspapers have been expected to operate within the norms of the objective model, with news articles not expressing the opinion of the writer or newspaper. The editorial section of the paper is an exception. These pages are the outlets for the editorial board, the publisher-sanctioned mouthpiece of the newspaper, to collectively craft and publish its views on a wide range of topics.

In 1970, *The New York Times* launched the first modern “opposite of the editorial page,” or op-ed page, opening its pages to outside nonjournalist contributors. In that spirit, the *Times* hired a conservative nonjournalist, William Safire, as a regular op-ed columnist. According to Stephen Rosenfeld, former editorial page editor of *The Washington Post*, in doing so, the *Times* was responding to popular calls for the institutions of authority in American society to, in effect, move over and make room for other participants. A growing appreciation of the complexity of issues of public policy made newspapers ready to share different perspectives on those issues.

However, *The New York Times* did not create the first op-ed page. Instead, the idea was conceived of by Herbert Bayard Swope, an editor at the *New York World* newspaper in the 1920s, who used the name “Op. Ed.” The difference from op-ed pages then and now is that Swope did not print unsolicited letters from the general public; instead he rounded up big names to write the letters.

Even so, *The New York Times* is widely credited for developing the archetype of modern op-ed pages in September 1970. By the 1970s, editors tried to distinguish their op-ed pages from others, but most adopted the common practice of devoting most, if not all, of their op-ed pages to outside

voices. The *Chicago Tribune* used its op-ed page in the 1970s to run opinions that countered the *Tribune*’s “staunchly conservative views,” while the *Los Angeles Times* opted for more localized opinions of a less intellectual bent than those found in *The New York Times*. In the early 1980s, the *Cleveland Plain Dealer* tried to engage its readers with more local voices by dropping syndicated columnists entirely for a time and recruiting local writers to contribute periodically. The increased use of op-ed pages encouraged the development of political columns in the 1960s and 1970s, and the sense that readers needed help in understanding not only politics, government, and business but also changing lifestyles led to a marked proliferation in types as well as numbers of columns.

By 1980, most newspapers had humorists as well as analysts on their editorial or opposite editorial pages, and some, especially smaller ones that did not have separate business or lifestyle sections, ran advice columns on business and other topics there. A survey conducted during the mid-1970s found that virtually all newspapers used some type of column on their editorial or op-ed pages. Political analysis and political reporting, presented in 93% and 75% of these columns, respectively, were the most popular. Other columns featured humor (63%), business (33%), religion (20%), advice (13%), and gossip (1%).

A 2013 Pew Research Center article reported that over the previous decade, there was a decline in the amount of space newspapers allotted to editorial and op-ed pages. According to the article,

Some papers have tried to compensate by running more editorials and columns online and launching more opinion-driven blogs. Some have shifted away from one of the historic missions of newspapers—influencing public opinion—and instead seek to foment community conversations online. (Enda, 2013)

Until the late 1990s, which saw the rise and proliferation of Internet venues for news and opinion, op-ed pages were one of the few places

in mainstream media where members of the public were provided an opportunity to offer their perspectives and shape public debate. In the 21st century, venues for opinionated public affairs content have proliferated in all forms of media, even those traditionally reserved for *objective* news.

In news magazines, newspapers, television news broadcasts, and Internet news sites, opinion and editorial sections abound. In many instances, they continue to be demarcated as such and cordoned off through section headers or prefaces and disclaimers from the official news sections of those publications and broadcasts. In other cases, the line between news and opinion is less clear. Some scholars argue that with the ability of the average person to become a *citizen journalist* and blog online, singular access to public space through newspaper op-ed sections is rendered less crucial. And so while newspaper op-ed pages still potentially wield power by influencing the sentiments of their readers, they are only one force of opinion in an ever-growing opinion media landscape.

Purpose and Structure

Newspaper op-ed pages can serve as a “forum for the exchange of comment and criticism,” one of the obligations of newspapers listed in the 1947 report of the Commission on Freedom of the Press, also known as the Hutchins Commission. Some newspapers may see op-ed pages as a comparatively inexpensive way to look good and attract readers. Some may obtain columnists to keep opposition newspapers from using them. Many look to columnists for information, analysis, and comment concerning national and international affairs they cannot afford to obtain on their own and which are not necessarily available through the basic wire services.

Some newspapers run columnists whose voices support and reinforce the philosophy of the publishers; some run columnists that differ with them politically, philosophically, or both, to provide readers a choice of benchmarks against which to measure their own views. Columnists can help satisfy these goals and perhaps provide incidental

benefits such as provision of ideas for editorials. By the turn of the 21st century, many newspapers had expanded the role of the op-ed page to their editorial pages, sometimes surrendering space normally reserved for the newspaper’s editorials for essays and letters from contributors and readers. Many newspapers that have just one opinion page per edition will construct them more as op-ed pages than as traditional editorial pages.

Smaller, more local newspapers sometimes feature community issue sections in their op-ed pages where members of the paper’s readership can weigh in on topics that affect their local community. At larger papers, letters to the editor are often selected and printed in the op-ed pages on the basis of the authority or notoriety of the writer, but often on the basis of the point of view expressed. Letters to the editor usually range in length from 200 to 500 words and are shorter than op-ed essays.

Corporations have strategically engaged in op-ed campaigns using paid issue advertisements that are printed in the op-ed pages of newspapers, such as the Mobil Oil Corporation’s op-ed campaigns between 1982 and 1986. Other organizations, including universities, have used unpaid essays on op-ed pages as a way of increasing the institution’s visibility. Public figures and academics often attempt to act as public intellectuals by getting their essays or columns published in the pages of well-known newspapers and magazines. In these ways, the op-ed pages may be used by interested parties to try to persuade readers to their point of view and gain recognition. A 2018 research study found that op-eds can change the minds of those who read them. The study’s authors estimate that in a major publication such as *The Wall Street Journal*, *Newsweek*, or *USA Today*, “if a successful op-ed is read by about a half-million people, we can expect it changes between 50,000 and 100,000 minds” (Coppock, Ekins, & Kirby, 2018).

In September 2018, *The New York Times* published an anonymous op-ed by a source within the presidential administration of Donald Trump that became a viral sensation. Titled, “I Am Part of the Resistance Inside the Trump Administration,” the piece described efforts by White House staffers,

including the author of the op-ed, to thwart Trump's "amorality" and "impulsiveness." The identity of the writer was a secret at the time to all but the *Times* publisher and editors in the newspaper's Opinion section. In late 2019, after resigning from the Trump administration, the same person published a book critical of Trump titled *A Warning*. It was not until October 2020 that the author revealed himself to be Miles Taylor, the former chief of staff at the Department of Homeland Security.

Challenges

Editors note that one challenge of maintaining a distinct op-ed page is generating a steady supply of quality submissions in order to fill the daily page. While prominent pages such as those of *The New York Times* and *The Washington Post* often ask noteworthy people to write op-eds, many newspapers seem to rely on a combination of volunteer writers from the community and unsolicited contributions. Some newspapers create *contributor boards*, or groups of diverse people from the community, who are asked to occasionally write columns. Some newspapers rely entirely on unsolicited contributions. A few use their op-ed pages for special purposes, such as publishing the submissions of scholastic essay contests or carrying a variety of opinions on specific themes that are of interest to the community.

Men's voices have dominated U.S. newspapers' op-ed pages, while women's voices have been noticeably lacking. Some successful op-ed contributors, in the spirit of increasing diversity of opinion, are training women at universities, foundations, and corporations to write op-ed essays and get them published. The OpEd Project, which has worked to increase commentary from women, said a byline survey conducted in 2011 found some improvement over the preceding 5 years, with more bylined opinion articles written by women, but that these still made up only 20% of op-eds in traditional media.

Some journalists and journalism scholars have noted another challenge facing op-ed editors: keeping the page open to *citizen writers* as opposed to politicians, scholars, newsmakers, public relations specialists, and special interest groups. In a 1994 survey of op-ed editors, researchers found

that the editors often gave preference to submissions from people who were principals in news stories, experts in the topic area discussed, or prominent at the local or national levels. About a third of newspapers in the survey sold space on the page for advertisements, further limiting the space available for essays from *citizen writers* (Ciofalo & Traverso, 1994, p. 54).

P

PACIFICA RADIO

The Pacifica Radio Foundation is the licensee for five listener-supported, noncommercial FM radio stations in the United States. Pacifica also controls the operations of these stations, which include KPFA Berkeley, California (first broadcast 1949); KPFK Los Angeles, California (1959); WBAI New York City (1960); KPFT Houston, Texas (1970); and WPFW Washington, D.C. (1977). Pacifica distributes news, public affairs, and cultural content on its stations and on some 200 broadcast and online content providers. Pacifica also owns the Pacifica Radio Archives, which houses over 100,000 items spanning the period from 1949 to the present day. Pacifica's primary contribution to journalism has been in through programs that document political debates, social justice movements, and cultural change. This entry examines Pacifica Radio's history, expansion, rise as an alternative news source, and its current status.

History of Pacifica Radio

The Pacifica Foundation was established in 1946 by Lewis Hill and a group of fellow pacifists. Imprisoned as a conscientious objector during World War II, Hill worked as a radio announcer after he was released. Hill viewed radio as a technology that could be used to promote dialogue between opposing viewpoints, build human relationships, and encourage the cause of peace. Concerned about the influence of commercial

advertisers, educational and religious institutions, Hill proposed to maintain the Pacifica station's independence by staffing it primarily with volunteers and by financing it entirely through voluntary contributions from listeners. At the time "listener sponsored" KPFA commenced broadcasting in the San Francisco Bay area on the FM band, FM radio had comparatively few listeners, and many radios were not even capable of receiving FM signals.

The content on KPFA consisted primarily of cultural programs and commentary. Some of the personalities associated with KPFA's early years later established themselves as noteworthy cultural figures, including Zen philosopher Alan Watts, New Yorker film critic Pauline Kael, and beat poets Lawrence Ferlinghetti and Allen Ginsburg. Political content was less prominent, though the station drew scrutiny for Hill's commentaries opposing the Korean conflict and the investigations of private citizens by the Federal Bureau of Investigation (FBI). Pacifica was regularly beset by internal tensions over governance and financial issues, and these may have contributed to the deterioration of Hill's health. Suffering from spinal arthritis, Hill resigned in 1957 and took his own life soon after.

KPFA established a reputation for public affairs programming under the leadership of Elsa Knight Thompson. As one of the few women employed as a journalist by the British Broadcasting Corporation, Thompson had covered World War II and interviewed Holocaust survivors in the aftermath. Between 1957 and the early 1970s, Thompson produced multiple programs exploring civil

liberties, human rights, and armed conflict. Her documentary *Black Friday* was widely distributed in the United States, and Thompson's work influenced the subsequent development of American public broadcasting.

Pacifica established KPFK in Los Angeles in 1959. The following year, the license for New York City's WBAI was donated to the foundation. These acquisitions significantly expanded Pacifica's audience and its exposure to critics. While the views broadcast on Pacifica stations regularly skewed to the political left, including those of the Communist Party, programs also showcased views on the right, including those of the John Birch Society. Leftist content drew attention of federal authorities. Following a broadcast that described rogue operations and racist behavior within the FBI, dozens of Pacifica associates were investigated by the Bureau and the Senate Internal Security Subcommittee. At same time, the Federal Communications Commission delayed the renewal of Pacifica's station licenses. The controversy subsided after a Pacifica board member confessed to a prior association with the Communist Party and resigned.

Alternative Journalism

Pacifica's reputation for alternative journalism grew in the 1960s. A WBAI reporter was the first U.S. journalist to file stories from communist North Vietnam. All of the stations initiated daily newscasts, and these became the foundation for a national news service. A number of Pacifica reporters from this period were subsequently associated with National Public Radio. In 1972, Pacifica offered expanded coverage of the Democratic and Republican nominating conventions. Pacifica widened distribution of its news and other programs to dozens of U.S. stations when its stations joined the National Federation of Community Broadcasters in 1975.

Pacifica enhanced its reputation for solid and sometimes controversial public affairs coverage in the 1980s. Station-based journalists, including Larry Bensky, Marc Cooper, Tim Frasca, Robert Knight, and Alan Snitow, joined by correspondents from around the world. Prominent coverage included reports from the civil wars in Nicaragua and El Salvador. Bensky hosted extensive live coverage, distributed by satellite, of the Iran–Contra

hearings. The broadcasts earned a George Polk Award for Bensky and producer Bill Wax. Pacifica similarly covered the confirmation hearings of controversial Supreme Court nominees Robert Bork and Clarence Thomas. During this period, WBAI reporter Amy Goodman established herself as perhaps Pacifica's most fearless journalist when she faced down armed troops while covering the popular rebellion in East Timor in 1991.

National Reach

Intent on expanding the reach of its national programming, Pacifica leadership took steps to establish a national network for community radio stations in the 1990s. Utilizing the NPR-managed Public Radio Satellite System, Pacifica increased its public affairs and talk offerings. Notable among these were Cooper's *Radio Nation* and *We the People* hosted by California Governor Jerry Brown. Although a network was never fully realized, Pacifica succeeded in setting up its own satellite distribution system on the Ku band in 1997. The system delivered dozens of weekly and daily programs, including the Pacifica Network News (PNN), and *Democracy Now*. Hosted by Goodman, the program featured breaking news, in-depth reports, and interviews with prominent figures across the political spectrum, including President Bill Clinton and Speaker of the House Newt Gingrich. Goodman also took the program out of the WBAI studios to cover events around the world. Goodman's resolute and sometimes confrontational style earned the respect of critics and news professionals. In the late 1990s, *Democracy Now* commanded an audience of up to a million listeners on more than 70 community radio stations.

Pacifica's expansion halted in 1999, when an internal crisis broke out over the organization's mission and governance. The dispute was manifested in bitter public divisions which pitted the national leadership against station employees, volunteers, and audiences. Staff dismissals, studio occupations, leadership resignations, and street protests followed. The crisis carried on for 2 years and severely hampered operations at all levels. The upheaval resulted in wholesale leadership changes and a complicated restructuring of the governance structure. While these changes were intended to make Pacifica more transparent and

representative, they also resulted in cumbersome and expensive processes. By 2001, PNN was no longer available. *Democracy Now* became an independent production, though it was still funded and promoted by Pacifica. Many PNN reporters moved to *Free Speech Radio News*, which was distributed by Pacifica and to about 100 community radio stations, as well as a few Internet audio streaming services, which were emerging at the time. Pacifica continued to produce and distribute programs for its Ku system.

Pacifica Radio in the 2000s

Since 2001, Pacifica has faced ongoing challenges. It's once dominant position as a source for progressive broadcast content has been challenged by a host of Internet competitors. Correspondingly, the stations' audiences and listener donations have ebbed. Pacifica's finance committee reported an operating deficit of more than \$2 million in 2015, which delayed grants from the Corporation for Public Broadcasting. In response to these challenges, Pacifica has attempted to reorganize all of its operations. In 2017, *Los Angeles Weekly* reported that KPFK's audience averaged only 700 listeners in any quarter hour, just a small fraction of other Los Angeles area public radio stations. Two thirds of the WBAI staff was laid off in 2013. Six years later, 10 of the remaining 12 employees were let go, and most of the station's local programming was removed. To maintain its operations, WBAI assumed a \$3.5 million debt. Pacifica no longer funds *Democracy Now*, and it has withdrawn support from the Pacifica Radio Archives, threatening the existence of a seminal collection of historic audio recordings. In 2020, staff at KPFK reported pressure from Pacifica's leadership to reduce hours and salaries or face layoffs. On the programming side, critics charged that Pacifica provides a platform for conspiracy theories concerning the spread of HIV and cancer and the tragedy of 9/11.

Pacifica's founders intended to prove that a radio station could champion principles of artistic and journalistic independence by relying entirely on financial support from the listeners. As long as radio remained largely unchallenged, Pacifica showed that the listener sponsored model could work, at least in major metropolitan areas. Subsequent history has demonstrated that the model is less viable for smaller audiences with less disposable

income. As more media demand direct payment from consumers, Pacifica's approach will be seriously challenged. Pacifica Radio remains significant in the field of broadcast journalism for its diverse, challenging, and sometimes groundbreaking coverage of views and opinions that have often been overlooked in other media channels.

PAKISTAN

With an estimated population of 233 million people as of July 2020, Pakistan is the second largest Muslim-majority country in the world. While over 96% of the population practices Islam, all four provinces, Punjab, Sindh, Khyber Pakhtunkhwa, and Baluchistan, feature remarkable ethnic and cultural diversity. Such diversity contributes to the diversity of opinion and expression when it comes to journalism and media practices in Pakistan, which, geographically, is slightly less than twice the size of California.

With approximately 3,000 privately owned newspapers and over 159 national, foreign news, and current affairs television channels, Pakistani media cater to the needs of citizens across the four provinces of the country. Two provinces, Punjab and Sindh, along with the federal capital, Islamabad, dominate the mass media landscape of the country.

This entry offers a brief overview of media practices in Pakistan, followed by a discussion on the status of its print and electronic media. It discusses the state of journalistic freedom and controversial media laws in Pakistan. It then provides an overview on the role of the Internet and social media as journalistic tools, both for the consumers and producers of news and information.

Origins of Pakistani Journalism

Even though Pakistan gained its freedom in 1947 from the British empire, the country's media history dates back to journalism under British rule in the 1800s. Journalism on the Indian subcontinent during the British rule was polarized between two extremes: one extreme represented a group of journalism practitioners who were proponents of the British rule; while the other side was representative of journalists who were strongly opposed to the colonizers and demanded the region's freedom from the British empire.

This latter extreme gave birth to the resistant role of journalism against oppressors. In other words, with its inception, Pakistan inherited a resistant type of journalism that shaped the country's media practices in later years. Even after getting its freedom from the British empire, the country's journalism continues to maintain the same level of polarization.

Print Media

When Pakistan came into being in 1947, print media was the only source of independent journalism in the country. At the time of partition, four major Muslim-owned newspapers were located in Pakistan. All four newspapers, *Nawa-i-Waqt*, *Pakistan Times*, *Zamindar*, and *Civil and Military Gazette*, were located in Lahore, which is the provincial capital of Punjab province. This geographical factor paved the way for Punjab to dominate the media landscape of this country in the later years.

In addition, *Dawn*, *The Morning News*, *Jang*, *Anjam*, *Dana Gujarati*, and *Daily Imroze* were among the significant print media organizations that played a primary journalistic role during the formative phase of Pakistan. Among these newspapers, *Dawn*, *Jang*, and *Nawa-i-Waqt* continue to survive

today, despite countless challenges to media freedom in the country. In other words, these three media are among the oldest news organizations in Pakistan that are considered journalistic standards in the country while maintaining their resistant role to the pressure groups. In a country like Pakistan, where state-owned media and yellow journalism practices blur the boundaries between true and false pieces of information, maintaining journalistic standards for any news organization can be a daunting task. *Dawn*, *Jang*, and *Nawa-i-Waqt* continue to maintain their objectivity in these circumstances. All three media organizations are privately owned, maintain journalistic ethics, and are trusted by a vast majority of people in Pakistan as credible news sources to verify the authenticity of a piece of information. In addition, the three news organizations are known for resisting pressure tactics from the country's ruling elites (both military and civilian regimes) to assure that they serve the public rather than serving the ruling elite.

In terms of media ownership, most of these early newspapers were privately owned and operated. This trend of private media ownership among print media organizations continues, despite economic and political challenges to media freedom in Pakistan. By 2020, Pakistan had more than 3,000 newspapers, and all of them were privately owned. It is interesting to note that while the print media is in decline globally, Pakistan is witnessing a steady growth in the number of newspapers. One reason for such a trend is the fact that local, regional, and national newspapers have the ability to cater to the needs of extremely complex and diverse audiences in a country like Pakistan where all four provinces are remarkably diverse on the basis of ethnicity, culture, economic status, education, and political views, to name a few.

Furthermore, since the country's national media is dominated by Punjab and Sindh provinces and may not fully cater to the needs of Baluchistan and Khyber Pakhtunkhwa, local and regional newspapers offer a better alternative to highlight the issues and plights of their target audiences. These regional newspapers' ability to publish in their readers' local language is another advantage that helps local ownership retain their readership in the communities they function. For example, Baluchistan province, which is historically neglected in national news coverage, is home to at least four native languages, Pashto, Balochi,

Sindhi, and Brahvi. Two regional-language newspapers, *Naweyzawand* and *Qudrat*, serve the needs of their communities by publishing in these languages.

Moreover, securing a license for a newspaper is a much cheaper option than acquiring a license for a private TV channel or a radio station in Pakistan. All these factors add up to the viability of increasing popularity of newspapers in the country at a time when private television channels and the Internet have already captured a significant market.

Electronic Media

Unlike privately owned newspapers, broadcast media (television and radio) in Pakistan remained state-run until late 2000. Both of these mediums have exceptional reach to their audiences all over the country and offer their services in more than 34 regional languages.

Pakistan Television (PTV)

The first television channel in Pakistan was PTV, which started its services in 1964 as a private entity. Nippon Electric Company, a Japanese company, launched this terrestrial television channel on November 26, 1964. Within 6 years of its launch, the channel was nationalized by the government of Pakistan in 1970. Since then, PTV served as the only entertainment and news and current affairs television medium to serve little over 86 million television viewers.

Radio Pakistan

Radio Pakistan, previously known as *Pakistan Broadcasting Service*, is the oldest broadcasting network in the country. It was founded on the same day when Pakistan announced its independence from the British rule on August 14, 1947. In fact, the news about Pakistan's independence was aired on the same radio network. Just like PTV, Radio Pakistan enjoyed exclusive status of being the only state-owned radio network until 2000, which had an unequivocal reach to the remote areas of the country. During the later years, Pakistan government started issuing FM licenses to private media owners.

By 2020, there were about 200 commercial and noncommercial FM radio channels functioning in the country. A majority of the noncommercial FM radio channels operate from universities and other educational institutions in Pakistan.

Since Pakistan is a developing country where the literacy rate is relatively low (59.1%), newspaper readership has been confined to those who had some level of formal education and were able to read and write (Arif, 2020; Central Intelligence Agency [CIA], 2021). Also, the country's literacy rate varies by region. Pakistan's urban areas have higher literacy rate (74%), as compared to 51% literacy rate for the rural areas. Regardless of the literacy rate, both educated and illiterate audiences could enjoy watching and listening to the electronic media at their own pace of understanding. These circumstances led to the exceptional popularity of PTV and Radio Pakistan in the country.

Until 2002, every dictatorial regime and the short cycles of military-backed civilian rulers enjoyed absolute control over the electronic media. Whenever newspapers challenged or questioned the ruling elites, PTV and Radio Pakistan were there to regain public support and trust in favor of the rulers. This factor gave the country's ruling elite absolute control over the electronic media because there was no worry or competition for the government to deal with. In other words, the electronic media was serving as an organ of the state rather than being an objective and credible journalistic source for the people of Pakistan. Hence, no private ownership for radio and television was allowed until 2002.

State of Media Freedom in Pakistan

In order to better understand journalism and its practices in Pakistan, it is imperative to highlight the politico-cultural context of the country. Soon after gaining independence, Pakistan faced a number of challenges including economic problems, constitutional crises, wars with its neighboring state, India, and the military's desire to run the affairs of the state by undermining civilian rule. Pakistani news media, particularly newspapers, found themselves caught in such challenges while they were still struggling to survive economically and professionally in the newly established country.

Since its inception, Pakistan witnessed three military coups, which span across 33 years of the country's history. Repeated martial laws, dictatorships, and military-backed civilian governments in the country's history targeted journalists and private media organizations to suppress any voices of dissent against the military rule. Journalists were tortured and punished both physically and economically for questioning the military dictators. The media situation did not remarkably improve during the so-called *democratic transitions*. Just like their predecessors (military dictators), civilian rulers also utilized similar tactics to suppress media freedom when and wherever needed.

To contain journalists, both civilian and military rulers amended the Constitution several times. Pakistan adopted its first-ever Constitution on March 23, 1956. According to the Constitution, freedom of speech was considered a fundamental right for Pakistan's citizens. Within 2 years of its promulgation, then-president Iskander Mirza abrogated the Constitution to suppress the opposition parties and the media who were criticizing the president for violating his Constitutional powers and interfering directly in the political affairs of the state (Arif, 2020; Khan, 2005).

General Ayub Khan, a military dictator who replaced Iskander Mirza, promulgated his version of the Constitution in 1962. The 1962 Constitution gave little-to-no importance to the freedom of speech. On the contrary, the Constitution gave numerous powers to the military dictator who had declared himself the country's president. This second version of the Constitution also did not last long. In 1969, another military dictator, General Yahya Khan, took over the country's reins and suspended the existing Constitution.

The third Constitution, which is still in existence in its amended form, was adopted in 1973. Then-Prime Minister Zulfikar Ali Bhutto promulgated the Constitution with all the political parties and stakeholders' consultation. For the first time, this Constitution ensured liberties for the freedom of the press, speech, and expression, known as Article 19 of the Constitution.

In 1977, General Muhammad Zia-ul-Haq declared himself the president of Pakistan after a successful military coup against the prime minister, Zulfikar Ali Bhutto. General Zia-ul-Haq suspended the 1973 Constitution once again and launched a

severe physical punishment system against any journalist who questioned his authority. General Zia's tenure ended with his death in a military plane crash. The later civilian governments reenacted the 1973 Constitution in the country.

In 1999, another military chief, General Pervez Musharraf, toppled prime minister Nawaz Sharif's government. Soon after taking control of the state, General Musharraf suspended the Constitution and declared a state of emergency. Media organizations and journalists were, once again, banned from questioning his authority. In April 2002, General Musharraf held a nationwide referendum to formalize his position as the president of Pakistan and reinstated the Constitution. In 2002, Pakistan's parliament adopted an extended version of Article 19 of the Constitution, which is known as Article 19A. This article goes beyond the press's freedom and extends the right to information to every citizen of the country.

Also, every time a military dictator took over the country's reins as a result of a coup, they introduced controversial media laws and regulations to suppress journalists and avoid media criticism. One such example of controversial media laws is Pakistan Electronic Media Regulatory Authority (PEMRA) Ordinance. In 2001, the military ruler, General Musharraf had introduced PEMRA as an executive order. The authority, initially established to regulate and issue licenses to electronic media, started prosecuting news media organizations (private television channels and FM radio stations) whenever they criticized General Musharraf's policies. Pakistani media organizations saw PEMRA's actions in contradiction with the Constitutional provisions of freedom of speech and expression.

Religion in Pakistan remains another pressure group on media. On one hand, Pakistan's ruling elite continues to use religion as an excuse to suppress media freedom by introducing and enacting antiblasphemy laws. On the other hand, Taliban-sympathizers and extremist religious groups are becoming a more significant threat to journalistic freedom in the country. In the wake of the terrorist attacks of September 11, 2001, when the United States and allied forces launched the war against terrorism in the northern areas of Pakistan and Afghanistan, religious extremist groups such as the Taliban emerged as the most

prominent threat to journalists who were covering the war in the region. Just like Afghanistan, Pakistan also witnessed Talibanization in the country. Many journalists covering the war against extremism alongside the borders of Pakistan and Afghanistan were threatened, and in some cases, they were killed by the Taliban. In Pakistan, the Taliban had its media spokesman and maintained media presence by pressuring regional journalists.

While Pakistani media continues to resist all the pressures on freedom of speech and expression, the 2020 World Press Freedom Index from Reporters Without Borders (RSF) ranked Pakistan extremely low (145) out of 180 countries in terms of the degree of freedom available to journalists. RSF also declared Pakistan as one of the most dangerous places on this planet to work as a journalist.

Privatization of Broadcast Media

The terrorist attacks of September 11, 2001, on the United States changed global media practices, forever. Such was the case with Pakistani media. When the United States and the allies decided to go after terrorists hiding in Afghanistan and the northern areas of Pakistan, the country's federal capital, Islamabad, became the epicenter of global news. Then-military ruler of Pakistan, President General Musharraf, realized that both of the state-run broadcast media, PTV and Radio Pakistan, were not enough to counter the Western media's narrative about Pakistan's alleged involvement in supporting Taliban. The military-backed government was desperate to neutralize this impression about its intelligence agencies' alleged role in supporting the Taliban. In order to do so, Pakistan needed its own voice in the form of independent media, which, in the eyes of the world, would carry more credibility and weight to support the country's narrative rather than the existing state-run media organizations.

Therefore, on March 1, 2002, President Musharraf established the PEMRA via an executive ordinance, instead of seeking formal approval from the parliament. The main objective to establish the PEMRA was to issue licenses for the opening of private television and radio broadcast media in Pakistan on an urgent basis. This development

gave birth to a new era of media privatization in the country. Within a decade of the passing of this Ordinance, Pakistan had little over 90 privately owned television channels, in addition to state-controlled PTV. A majority of these channels were dedicated to 24/7 news and current affairs programs. Furthermore, around 69 foreign satellite television channels were also available in Pakistan to serve approximately 86 million viewers. Such a dramatic change in the electronic media landscape was widely welcomed throughout the country.

Pakistani establishment's strategy to give way to private media ownership (news televisions and FM radio) worked well. The rulers in Pakistan were able to achieve their motive of promoting Pakistan's version of "truth" to the Western world and to its own people via these so-called independent and privately owned electronic media organizations, instead of entirely relying on the state-owned media. Since the state-run PTV and Pakistan Radio have always been under the direct control of the state apparatus and serve the ruling elite's interest, they do not enjoy the reputation of being free and objective both inside and outside of the country. On the contrary, privately owned electronic media in Pakistan enjoy the status of being free from direct control of the establishment. In the wake of 9/11, international audiences paid more attention to what Pakistani private media had to say than what was being aired on state-run PTV and Radio Pakistan. On a side note, the aspects of objectivity and freedom of Pakistan's privately owned TV channels are debatable. The establishment continues to find new ways to exert its control over private media ownership. One such tactic is punishing private news organizations by suspending their advertising revenue if a television channel deviates from the establishment's desired path.

In addition, general public in the country are becoming increasingly obsessed with the opportunity to enjoy watching and listening to their favorite news and current affairs programs on private news networks. However, under such a rapid transformation, PTV and Radio Pakistan have lost their hegemony over Pakistani public, for good. When these private TV channels started to become critical of military rule in Pakistan, the ruling elite started to introduce strict and controversial legislation to regain control of private media in Pakistan.

Controversial Media Laws

Since both the civilian and dictatorial rulers in Pakistan had already learned that they cannot afford a completely free media, which is capable of not only questioning the rulers but also turning the general public in favor of or against a particular matter of national importance, new and stricter journalism and media-related laws and regulations were introduced. In addition, the provisions of freedom of speech and expression in the Constitution of Pakistan were amended to contain journalistic freedom in the country. Furthermore, during the later years, PEMRA, which came into being as a result of an Ordinance in 2002, was given the status of an Act by the Parliament of Pakistan in 2007. Several amendments were introduced in the Act to make PEMRA more powerful in controlling the private media.

While PEMRA was still focused on dealing with private TV channels and FM radio stations, Pakistan started to witness the popularity of the Internet and social media tools such as YouTube, Twitter, Facebook, and Instagram, to name a few. People had the ability to express their political views via these social media platforms without any repercussions. Therefore, the military-backed government of Imran Khan realized the need to either further amend PEMRA or to introduce an entirely new authority that can control both broadcast media and the Internet effectively. In order to do so, the executive branch on January 26, 2019, gave approval for the creation of Pakistan Media Regulatory Authority (PMRA), which, if passed by the parliament, would replace PEMRA. This authority would enable the government to regulate all kinds of media (including print, broadcast, and the Internet) via one platform, thus, giving absolute control to the authority.

Even though the Constitution of Pakistan guarantees freedom of speech and expression to individuals and the press, several amended provisions in the same Constitution including antiblasphemy laws prohibit individuals and media from expressing their dissent about religion, military, and the heads of the state.

Internet and Mobile Communication Platforms

In the mid-1990s, the Internet was introduced in Pakistan as a purely educational tool and was

mostly housed in universities and other educational institutions. Partly, this was because owning computers and a subscription to the Internet was an expensive commitment at that time. However, over the years, as the cost of computers and smartphones decreased, more people began to subscribe to the Internet. By 2020, Pakistan had approximately 77 million active Internet users. By January of 2020, the Internet penetration rate for the country was at 35%, with 37 million active social media users for the same time frame.

Mobile communication via smartphones is another growing field of information and communication in Pakistan. According to statistics provided by the CIA website, more than 90% of Pakistanis live within areas that have cellphone coverage. By January 2020, there were 164.9 million mobile connections in the country. In other words, 75% of the population of Pakistan are active users of the mobile phones. With smartphones' ability to connect to the world of social media via Internet, these devices offer an extremely powerful mode of communication to the citizens of Pakistan.

When the Internet and mobile phones were launched in Pakistan, no one anticipated that such complex and highly advanced mediums of digital communication would one day become part of citizens' everyday life. Thus, the ruling elites did not pay any special attention to enact laws geared toward regulating the Internet and social media platforms. The Lawyers' Movement of 2007 and 2008 against Musharraf was perhaps the first formal political activism in Pakistan that utilized the Internet and associated social media platforms to express dissent and unhappiness toward the regime. As a result, the civil and military establishments in the country, realizing the full potential of this alternative form of communication, decided to enact laws to control this new medium, which seemed to be far stronger and more efficient than TV and print media combined.

Ironically, while the Internet and social media contributed to loosening the exclusive control of power elites over freedom of speech and information in Pakistan, the same tools are also becoming popular among state actors. There have been several reports that the civil and military establishments have started using social media to promote their narrative via fake or anonymous accounts, such as Twitterbots. Furthermore, the private

television media have also witnessed an influx of “pro-establishment” journalists who are allegedly being implanted by the establishment to control these media organizations internally.

PALEY, WILLIAM S.

William S. Paley (1901–1990) is remembered best as the broadcasting pioneer who bought a struggling, early radio network and developed it into the highly successful communications conglomerate, Columbia Broadcasting System, CBS Inc. Known for his focus on programming and use of on-air talent in building on broadcasting success, Paley's broadcast operation became known for its class as the “Tiffany Network.” For over 50 years, he controlled CBS as president or board chairman of radio and television, film, publishing, recording, and all of the other media-related subsidiaries. He would build and nourish the popular CBS quality brand to appeal to large numbers of radio listeners and, later, television viewers. He is also remembered for his strong support of and appreciation for early broadcast reporting and reporters, including especially the leading luminaries of the field: Edward R. Murrow, Eric Sevareid, Charles Collingwood, Howard K. Smith, Fred W. Friendly, Walter Cronkite, Dan Rather, and Don Hewitt. This entry discusses Paley's life and work and his significance in the broadcast industry within and outside of CBS News.

Life and Work

The son of Ukrainian Jewish immigrants, Paley was born in Chicago, Illinois, on September 28, 1901. He began his education at the Western Military Academy in Alton, Illinois, just across the Mississippi River from St. Louis, Missouri. He studied briefly at the University of Chicago and received a

Bachelor of Science degree from the Wharton School at the University of Pennsylvania in 1922. Upon graduation from the University of Pennsylvania, he went to work for his families' business, a cigar manufacturing company, the Congress Cigar Company of Philadelphia, one his family had developed from a simple Chicago cigar store. He became the vice president and secretary of the family organization and took a special interest in the response the companies' products received from the company's sponsorship of radio programs. He continued experimenting with advertising on early radio. With funds borrowed from his father, he bought the 16-station United Independent Broadcasting Corporation in 1928. He used the purchase of the network for \$400,000 as the basis to build the Columbia Broadcasting System (CBS).

Paley took over as president of the company just two days shy of his 27th birthday. In doing so, he formed close relationships with many of the leading, early radio performers including prominent comedians heard over other radio networks, especially NBC. He personally got to know the comedians Jack Benny, Bob Hope, George Burns, and Gracie Allen, as well as talented vocalists including Kate Smith, Bing Crosby, Bob Hope, and Frank Sinatra. Paley could be very charming and courted many talents to switch to his network.

Paley developed strategies for increasing profit for the stations in the CBS group while also strongly supporting his network affiliates, including some acquired from other radio companies through a highly creative cost-sharing plan. The so-called "Paley Plan" offered affiliates unsponsored programs free. Also referred to as sustaining shows in the early days of radio, these unsponsored programs offered the chance for considerable sharing of proceeds from commercial offerings, if the stations would only come and join the CBS Network. And many did. This plan proved to be highly beneficial to both the growth of the CBS Network and the financial standing of its individual station affiliates, most of which were situated in U.S. population centers.

Paley was married twice, first to Dorothy Hart Hearst, with whom he had two children, and then to Barbara "Babe" Cushing, with whom he also had two children. Paley and his second wife became notorious for their high society lifestyle in New York. Paley became a collector of

post-Impressionist masterpieces and also, for over a half century, a trustee of the Museum of Modern Art. Paley died of a heart attack on October 26, 1990, at the age of 89 at his home in Manhattan. Cronkite said that with Paley's death the pioneer era in broadcast history died and he credited him for understanding the need to give broadcast news "a liberty to perform without commercial or political interference."

Paley as a Broadcast Manager

Some of the biographical works about Paley, including Sally Bedell Smith's *In All His Glory: William S. Paley, the Legendary Tycoon and His Brilliant Circle* (1990), are critical of Paley and the reputation he built for himself—as well as his treatment of the talented team of lieutenants he employed. Smith maintained for example that Paley had turned over much of his network's control to the advertising agencies during his World War II military service, at least initially while he was supervising the Office of War Information in the Mediterranean, and then later while serving as deputy chief of the American military's Psychological Warfare Division. But most other books about Paley and his communications empire credit his foresight in taking over control of the production side of broadcasting, wresting control from sponsors, theatrical producers, and advertising agencies. During the blacklist era of the 1940s and 1950s, when individuals who were or were suspected to be linked to the Communist Party were forced out of jobs, the CBS network instituted an in-house questionnaire addressing this topic, among other things.

Paley later maintained that the use of a company questionnaire was geared toward addressing attempts at blackmail, potential false accusations, and influence by outsiders, all of which ironically acknowledged the influence of the organizations behind the broadcast industry's blacklist. Generally, Paley's talent as a broadcast manager credited his ability to identify and employ talented people, to connect with them personally, and also an ability to somehow graft his own personal charm and first-class approach to network operations so that they were almost indistinguishable. In terms of his use and occasional alleged overuse of some of his talented assistants, Paley undoubtedly benefited from having an experienced and very capable

operational manager, Frank Stanton, overseeing many of his broadcast operations, including many of the details for which CBS became known.

Stanton, who joined Paley and CBS after completing his doctorate at Ohio State University in 1935, assisted initially in the area of audience ratings and then later acted as an intermediary and spokesperson for Paley when things occasionally got tough. He was named network president in 1946 while Paley remained as chairman. He defended Paley and CBS, for example, when the network was taken to task by some government officials for a series of programs in 1954 on *See It Now* attacking Senator Joseph R. McCarthy, who had made unsubstantiated public accusations of political disloyalty against numerous people. Tired of such controversy, Paley canceled Murrow's *See It Now* series 4 years later in 1958. As the news division developed, the CBS network again faced criticism for Murrow's handling of some full-form, highly focused news documentaries, including "Harvest of Shame," about the plight of migratory laborers. After Murrow left CBS to join the administration of President John F. Kennedy in 1961, CBS continued in the tradition he had established. Nonetheless, Cronkite, who became anchor of the CBS evening newscast in 1962, faced occasional challenges from within the network, as when he was told to cut part of a report about Watergate.

In most of the written accounts of his life and work, Paley is credited for having supported excellence in news broadcasting by investing in talent development, including the hiring and advancement of TV's leading news figures Murrow and Cronkite. In news broadcasting, just as in his support for popular entertainment programming over CBS Radio, many of the early connections and strategies Paley used in the medium radio carried over into television and broadcast journalism. The label the "Tiffany Network" that was applied to CBS during the Paley years reflected the high regard his organization gained for its quality programming and also for its people, many of whom were recruited directly—and personally—by Paley.

With respect to Paley's contributions to broadcast news during the early era of radio development, he is applauded for endorsing the establishment of *CBS World News Roundup*, a daily program focusing on reports by a select group of specialized and knowledgeable foreign

correspondents under the direction of Murrow and CBS News Director Paul White. With Paley's endorsement, Murrow always liked to say that he was hiring correspondents not for the way they sounded "on-the-air" but rather for the knowledge they had and could widely draw upon from their diverse background and experience in terms of the stories they reported. As a result, Murrow oversaw the work of many individuals who would become household names, both as broadcasters and a few as distinguished authors and scholars. In addition to Seavreid, Collingwood, and Howard K. Smith, they included William L. Shirer, David Schoenbrun, H.V. Kaltenborn, Winston Burdett, Raymond Gram Swing, Larry LeSueur, and Robert Trout.

As television developed and CBS continued to make significant inroads as a highly regarded broadcast news leader, some of its programs and properties began to provide large returns on investment. As a result, competing networks attempted to replicate that success.

Among the most successful news shows at CBS was *60 Minutes*, which began under Hewitt as producer with hosts Mike Wallace and Harry Reasoner and became recognized almost immediately for quality journalism with well-sourced and hard-hitting investigative reporting on a par with print counterparts including *The New York Times* and *The Washington Post*. As in the earlier years of radio, Paley was occasionally found having to respond to tough reporting and lawsuits that questioned the means and methods of reporting on some tough subjects. By about 10 years before Paley died in 1990, *60 Minutes* was rated the number one program out of a little more than 100 shows on television. Without question, the initiative and strong level of support Paley had provided CBS News offered a model for success few could claim.

PANAPRESS

To understand the history and mission of the Pan African News Agency (PANA also referred to as *PANAPRESS*), it is necessary to return to the 1970s when independent African nations began to question the inadequate and negative coverage that the Western news media gave them, and how the one-way flow of information, ownership, and management patterns favored Europe and the United States to their disadvantage. This information imbalance was first addressed in the late 1970s when Senegalese-born Amadou-Mahtar M'Bow became UNESCO's director general (1974–1987). Under M'Bow's watch, UNESCO commissioned a report, *Many Voices One World*, also known as the *MacBride report*, to explore the issue and to determine possible initiatives. It was out of this report that the Organization of African Unity on July 20, 1979, with African ministers of information created the PANA with Dakar, Senegal as its headquarters. From here, PANA originally aimed to change Africa's depiction to a more favorable one for audiences inside and outside of the continent.

From the time of its inception, PANA has undergone a plethora of growing pains brought on by government controls, antiquated technology, and financial difficulties for the nonpayment

of fees by participating member nations. In 1993, a new head came on board with the determination to modernize PANA by focusing on editorial independence and privatization by restructuring editorial policies. This new direction paid off since contemporary democratic movements fueled by a "third wave" of democracy were simultaneously taking shape throughout sub-Saharan Africa. These new policies hoped to consolidate its editorial independence in order to boost its credibility and prepare it to embark on an aggressive marketing of its products and its capacity and position as the premier source of reliable information on Africa and to make its editorial products more accessible to media in Africa.

According to findings published in 1995 by the African Studies Center and the University of Pennsylvania, these new developments within PANA came in

the wake of the commencement of a recovery plan which involves setting up new structures to propel the agency towards privatization by 1996. The restructuring had three main objectives: (1) Consolidate PANA's editorial independence in order to boost its credibility and prepare it to embark on an aggressive marketing of its products in its capacity and position as the premier source of reliable information on Africa; (2) Make its editorial products more accessible to media in Africa and in other continents through the operation of its own satellite telecommunication network (VSAT) covering the entire continent and 75 other countries in Europe, America, the Arab world and Asia; and (3) Open its share capital to private investors up to a 60-per-cent ceiling. Two years after the beginning of the implementation of the recovery plan, the Pan-African News Agency has gone through major changes not only in terms of its editorial activities but also with regards to the collection and transmission of news.

Today, it exploits a series of intranet, Internet and extranet networks and over 5 million users have access to its production every month.

In 2019, the Arab Bank for Economic Development in Africa ran a story on their website suggesting that PANA was fueled by African investors interested in providing efficient means of communication for

their audiences. The initial capital behind the endeavor allowed for editorial and financial autonomy, which in turn built the organization's credibility on international levels. PANA provides news about a plethora of topics covering agriculture, the economy, renewable energy, gender, health, sciences, technology, politics, health, sports, environment, entertainment, crime, the African Union, and the 2019/2000 pandemic. The newsroom also provides a weekly review of the African press.

PANA currently diffuses several daily news casts which can fully meet any demands in terms of news on Africa: economy, technology, politics, gender, health, sports, environment, and culture. The newsroom also provides a weekly review of the African press, in English, French, Arabic, and Portuguese.

PANA was essentially created to project the image of a continent that is on the winning side. The editorial team The Central Newsroom, based in the agency's headquarters in Dakar, ensures the development and coordination of a network of correspondents throughout the continent. Managed by professionals, this symbol of African unity and solidarity contributes in taking up the challenge of ensuring high quality news coverage of the continent and its key areas of interest.

PARODY OF NEWS

The parody of print and broadcast news involves the employment of a variety of print, televisual, and filmic representations of journalism and journalists for comedic and often satirical purposes.

Closely related to the literary traditions of satire and lampoon, news parodies frequently combine humorous content with biting criticisms of the shortcomings of the media business.

Traditionally, a piece can be considered parody when it draws upon an existing, commonly “serious” work for comical or critical effect. While parody is closely related to satire, the two terms are not interchangeable. The primary purpose of parody is typically humor. Satire, while often containing elements of humor, does not have to be funny. Satire is more concerned with presenting the faults and failings of some entity or situation with the objective of shaming or ridiculing the target into change. The roots of parody stretch back to ancient Greece, with Aristophanes often credited as the father of parody for his lampooning of the playwrights Euripides and Aeschylus in *The Frogs*.

The parody of news can focus on news content (the actual stories), news format and conventions, or a combination of the two. A particular parody may address the serious news of the day in a comedic or parodic format, retain the traditional structure of “legitimate” news while parodying the content, or lampoon both the format and the content simultaneously. Parodies of news can be found across a wide range of media, including print, television, film, and the Internet. This entry discusses notable parodies in a variety of media and concludes by looking at how the proliferation of media platforms has affected news parody.

Notable Print Parodies

National Lampoon's Sunday Newspaper Parody, first published in 1978 and rereleased as a paperback book in 2004, was originally published in a traditional newspaper (broadsheet) format as *The Dacron (Ohio) Republican-Democrat*—proudly proclaiming itself “One of America's Newspapers!”—and extended the parody beyond article content into advertisements, the Sunday magazine section, comics, and movie listings. (“Living Play Things,” for example, sells “Ohio's Freshest Pets.” Their sale on Teacup Dobermans and Mexican Chili Dogs includes, free with any purchase, a mud-breathing Southern American Muck Puppy. The ad is a sidebar to the articles, but just as much a part of the joke.) *The Sunday Newspaper Parody*

published only one issue and can still be found in book format.

Perhaps the most famous of all parody newspapers is *The Weekly World News*, which at its zenith, enjoyed a circulation of over a million per issue. When the paper began in 1979, it maintained that the articles printed within were true and legitimate. By 2007, when it ceased production, no such pretense remained. *The Weekly World News* existed as a parody of supermarket tabloid newspapers, often printing articles concerning Loch Ness Monster sightings, alien encounters, giant mutant animals, and the mysterious “Bat Boy”—a half-human, half-bat creature that has engaged in a variety of offenses, including stealing an automobile, endorsing Al Gore during the 2000 presidential elections, and campaigning for a gubernatorial seat.

First published in 1988 at the University of Wisconsin–Madison, *The Onion* is a free newspaper which publishes wildly fictitious articles in a very traditional tabloid newspaper layout. The parody of conventional newspapers extends to nearly every section of the publication, from headlines to article content, polls to editorials, horoscopes to advice columns. *The Onion*’s international website, launched in 1996, significantly increased the circulation and national attention of the publication.

In 2008, *The Onion* boasted over 5 million unique page hits per month; by 2019, that figure had risen to 6.87 million per month. *The Onion* also publishes compilations of its articles in compendium volumes including *The Onion Ad nauseam* (2002). On occasion, the traditional format of *The Onion* has led the unsuspecting to believe articles published by the paper are true. In 2002, the *Beijing Evening News* cited as factual an *Onion* article detailing Congress’s threat to move to another city if Washington, D.C., failed to install a retractable dome on the Capitol building. In 2004, MSNBC commentator Deborah Norville cited an *Onion* article proclaiming that over half of American exercise is televised.

In 2007 launched The Onion News Network, a website dedicated to producing the same *The Onion*–style parody news stories in video format. *The Onion* spawned dozens of similar parody websites, including The Hard Times and ClickHole; in 2018, *The Washington Post* mistakenly

used a ClickHole story as a citation in a real news story. Although it was eventually edited out, the original version still lives in infamy on several websites.

Notable Television and Film Parodies

The *Benny Hill Show* (1969–1989) aired “News at Ten” (1971), a spoof of British ITV network’s nightly newscast. A dozen years later, French television producers Roland Topor and Henri Xhonneux’s *Téléchat* (1983) lampooned news broadcasts using hand puppets of a cat and an ostrich. *Not Necessarily the News* (1982–1990) was an American version of Britain’s *Not the Nine O’Clock News* (1979–1982). Both programs made extensive use of reediting actual news footage with new voiceovers to create parody stories. In particular, *Not Necessarily the News* on Home Box Office often repackaged interview responses from political figures with new questions from the cast to create comic and fictional interview segments—most famously with former Secretary of State Henry Kissinger and the wife of then–Vice President Dan Quayle.

The British BBC2 network produced an adaptation of the radio program *On the Hour* for television in 1994. Titled *The Day Today*, the series combined a traditional news magazine format with fictional parody content, skewering not only the overly serious nature of news anchors and field reporters, but the technological gimmickry of news broadcasts. Regularly, the program featured incredibly complicated computerized lead-ins and credit sequences.

Saturday Night Live’s “Weekend Update” segment has been a mainstay sketch of the comedy program since the show first aired in 1975. While 36 different comedians have anchored the news commentary desk, the format has not much changed in the segment’s 44-year run. “Weekend Update” typically takes actual events and pairs them with comedic commentary from the anchors in a parody of evening news broadcasts. The segment usually involves guest commentary, editorials, or other special spoofs based on current news items.

Prominent television news anchors have often been spoofed, and in multiple venues, from the bumbling news anchorman, Kent Brockman on

The Simpsons (1989–), to *Sesame Street*'s (1969–) two “Grouch news” anchormen, Dan Rather-Not and Walter Cranky. Comedian Will Ferrell took the image of the traditional broadcast news anchorman to ridiculous proportions in the 2004 film *Anchorman: The Legend of Ron Burgundy*, lampooning not only the stuffy and dowdy seriousness of television news anchors, but interstation news team rivalries, local journalists' coverage of local media events, and the celebrity that comes with leading a television news team.

Both *The Daily Show* (1996–) and *The Colbert Report* (2005–2014) on the Comedy Central cable channel operated within traditional formats—the news magazine and the cable political pundit program, respectively. Jon Stewart, host of *The Daily Show* from 1999 to 2015, repeatedly referred to his program as “a fake news show,” despite the fact that studies indicated many viewers under 30 used *The Daily Show* as a primary news source. Both programs presented actual (though edited) news stories, then provided comedic/parodic commentary about the stories.

The Colbert Report was modeled on cable network pundit Bill O'Reilly's *The O'Reilly Factor* (1996–2017) and was more of a direct parody of both the format and the content of that program. *The Daily Show*, which Trevor Noah began hosting in 2015, features news packages from “Senior Correspondents,” editorials, and interviews with celebrities and political figures. Its coverage of the Iraq War (titled “Mess O'Potamia”) and presidential elections in 2004, 2008, 2012, and 2016 (“Indecision 2004,” “Indecision 2008,” and “Democalypse 2012;” the 2016 election was so jarring as to not have been given a clever name) have earned the program multiple Emmy and Peabody Awards. *The Daily Show* also spun off several correspondents into programs on other networks: *Important Things With Demetri Martin* (2009–2010) and *The Opposition With Jordan Klepper* (2017–2018) were eventually canceled; *Patriot Act With Hasan Minhaj* (2018–), *Last Week Tonight With John Oliver* (2014–), and *Full Frontal With Samantha Bee* (2016–) continued to air as of 2020.

The intent of the best news parodies is to critique some of the genre's most recognizable features—its serious nature, its predictable and familiar formats, and its reliance upon the myth of

photographic truth. In essence, the best of the news parodies are those that take the news industry seriously as they poke fun at it.

Evolution of News Parody

News parody has evolved along with the growth and diversification of media platforms. The media landscape that germinated programs such as *The Daily Show* and *The Colbert Report* was vastly different than *Not Necessarily the News* had access to in 1982. *Last Week Tonight With John Oliver* has had particular success in blending serious reporting with late night comedy in a way few could have imagined three decades earlier. Despite the news parody options on broadcast and basic cable, Oliver's show has thrived on Home Box Office, a pay channel. *Patriot Act With Hasan Minhaj* has found its own success on Netflix.

It is tough to overstate the impact of the Internet on the distribution and consumption by audiences. *The Onion*'s readership exploded upon the launch of its website; even defunct parody outlets such as *The Weekly World News* and *Not Necessarily the News* are kept alive through Internet niches dedicated specifically to those entities. With the increase in access to immediate information the Internet brings comes an increase in access to (and for) those who would poke fun at that information. *The Daily Show* currently maintains a website containing an archive of every episode of the program for free streaming download; *The Onion*'s website allows users to search a collection of almost two decade's worth of articles.

PARTICIPATORY JOURNALISM

The term *participatory journalism* describes the phenomenon of audience involvement in the making and disseminating of news within the context of professional news organizations. Around the turn of the 21st century, new online journalistic initiatives popped up that included participation of the audience. Discussion platforms were launched where the audience could give their opinion, such as the BBC web page Have Your Say. News organizations created platforms that allowed news consumers to upload their own material, such as CNN's iReport and the Spanish newspaper *El País's* Yo, Periodista, or provide inside information, such as British newspaper *The Guardian's* Guardian Witness and Dutch public broadcaster NOS's NOS Ooggetuige (NOS Eyewitness). Projects were initiated where audience members could publish stories about events in their local communities, such as on the Dutch news portal Dichtbij.nl, owned by the Telegraaf Media Group. Some of these initiatives were short lived while others turned out to be more viable. What they have in common is that *lay* people who are not professional journalists play a role in the observation, selection, production, and distribution of newsworthy information. All of these developments were driven by digital technologies.

Participatory journalism is sometimes used interchangeably or as synonym with civic journalism and with citizen journalism, although scholars have drawn distinctions among the terms. In a 2003 report, Shayne Bowman and Chris Willis described

participatory journalism as a bottom-up emerging phenomenon with an active role of the audience in the process of news gathering and dissemination in order to provide the information required in a democracy. The bottom-up phenomenon distinguishes participatory journalism from civic journalism, which Bowman and Willis described as a journalistic movement in which the news organization actively engages with its audience in order to contribute to citizenship. Joyce Nip (2006) drew a clear line between participatory journalism and citizen journalism on the basis of the absence (citizen journalism) or presence (participatory journalism) of professional news organizations in the production and dissemination of information.

This entry first addresses why participatory journalism raises fundamental questions about the relationship between journalism and the audience. Next, it describes how participatory journalism is perceived by academic scholars, by professional journalists, and by news audience members in their participatory role; from each of these perspectives, the influence of participatory journalism on news content is elaborated. Finally, the impact of participatory journalism on the journalistic field is discussed.

Participatory Journalism and the Promise of Technology

The rise of the Internet and the gradual digitization of communication processes and products provided the necessary context for a phenomenon like participatory journalism to develop. Digital technologies opened up possibilities for the audience to engage in the making and disseminating of news: Using digital and mobile devices, anyone can take photos or record audio or video of events. Digital technology, therefore, holds the potential to solve the paradox of journalism expected to be the eyes and ears of the world to monitor all potential newsworthy events even though journalists cannot be in all places at all times.

In spite of its fundamental aim to represent individuals, groups, and organizations in society, journalism is inherently confronted with its limitations. Research has overwhelmingly shown that journalism does *not*—could not—represent all groups and organizations in society in an equal or

representative way. Including the audience in recording what is of public interest and importance provides journalism with the possibility to better fulfill its essential function in a democratic society, that is, providing a representative record of reportable events. But with these possibilities arose a new paradox that soon was recognized by professional journalists: Including the audience to improve journalism entails handing over control to *amateurs*. Academic researchers of journalism have observed and analyzed these developments from the beginning of the 21st century.

Scholarly Debate on Participatory Journalism

The early studies on participatory journalism, by and large, were hopeful about participatory journalism's potential to engage the audience in the making and disseminating of news. Scholars saw this as an opportunity for journalism to live up to its professional ideology that calls for full and open access to truthful and important information of public interest and public importance. This optimism was fueled by normative notions on the conditionality of representative journalism in democracies. But when the first empirical studies appeared, it soon became apparent that expectations were not met: Journalists appeared to respond in defensive or reluctant ways, while the audience remained largely indifferent. Merel Borger and colleagues (2013) concluded that scholars appeared disappointed: with the professional journalism's obduracy; with the apparently economic (rather than democratic) motives to facilitate participatory journalism; and with news users' passivity. Two ideological incompatible perspectives seemed to obstruct maturation of participatory journalism: the sociology of the journalistic profession, with its emphasis on boundary maintenance, *versus* the audience affordances of digital technology.

Professional Journalists' Expectations of Participatory Journalism

The main question that was put forward in early academic thinking on participatory journalism was how professional journalists envisioned participatory journalism and what possibilities they

saw for amateurs to partake in journalistic activities. Some professional journalists appeared to step forward as innovators and facilitators of participatory journalism, arguing that traditional journalism was excluding audiences and thus in need of innovation. Other journalists were more reluctant to give the audience control over journalistic content, preferring audience participants to remain in a subordinate position. That is a position where the public assists professional journalists in finding the appropriate information and sources and is regarded as representatives of public opinion and commercial interests. Professional journalists thus negotiated between resistance and renewal; comparing participatory journalism in several European countries, they appeared to use legitimacy claims referring to expertise, duty, and autonomy in order to distinguish their own work from that of nonprofessional journalists.

Academic studies on participatory journalism in the first decade of the 21st century focused on the tensions between professional journalists and audience and show how, on the one hand, journalism was criticized for its conservative and exclusive practices, while on the other hand, it was esteemed as a professional institute and exclusive skill. In the second decade of the 21st century, a gradual evolution in the attitude of professional journalists toward participation of lay people was witnessed.

The onset of academic studies on participatory journalism was overwhelmingly situated within a Western context. From 2010 on, also non-Western studies were published, mainly situated in Arab or African countries. These studies demonstrate how, in situations where mainstream professional journalism operates under government restrictions of uprising or civil war, alternative forms of journalism arose that involved the audience gathering and sharing information that otherwise would not have been made public. These various contexts provide examples of shared information-producing communities. This more optimistic view on the possibilities of participatory journalism was also reported in Western studies of news platforms that focus on a particular small community or neighborhood. In such *hyperlocal* platforms, anyone—citizens, bloggers, local reporters alike—is *in the know* of what is reportable to a similar extent.

Such contexts appear to be more fruitful for developing adaptive organizations of news information producers that influence each other and redefine the aims, standards, and ideology of journalism.

Audience Expectations of Participatory Journalism

Academic knowledge about the motives, expectations, and experiences of *lay* people with participatory journalism is less developed as compared to the role of professional journalists and limited by the fact that studies took place almost exclusively within a Western context. That said, audience studies of participatory journalism suggest confirmation of the strength of *old* media use habits. Generally, audiences appreciated the idea that participatory journalism exists but showed less enthusiasm for active participation. Where it did occur, participation showed different practices than were called for by professional journalism's ideology of providing information of public interest and importance. Instead of producing news for the common good, the onset of participatory journalism mainly showed lay people producing news of a personal character and expressing their own opinion. Instead of participating for democratic reasons, as scholars and media observers hoped for, many appeared to participate to have *fun* and be creative.

Individual and personal motives particularly blossomed in the context of hyperlocal news websites, where the audience has a relatively large span of control over journalistic productions. Circumstances are favorable to express individual and personal experiences and opinions or to generate positive attention for one's own company, civil organization, or professional association on websites such as the *Wijkkrant* (*neighborhood newspaper*) found in some Dutch cities, where local participants run and fill a digital newsmagazine on locally relevant topics, varying from shops and parks to regulations and personal impressions. In such contexts, the boundary between journalism on the one side and marketing, advertising, or public relations on the other is thin; therefore, such practices have not posed a serious challenge to the dominant journalistic professional ideology.

However, since around 2010, the desire to contribute to a better overall information environment

has proven to be a recurrent motive for lay people to become engaged in journalism, specifically in established journalistic organizations with a high reputation. In these contexts, participants receive little autonomy and almost no control over content and function merely in the role of sources of experience who can contribute by providing information or insight from their particular point of view in society. In other words, some participatory journalists take part in journalistic activities as upgraded sources, exactly to the limited degree of autonomy granted by the professional news organizations. The motivations and experiences of participatory journalists appeared to be varied and context related but largely remained regulated within the context of professional journalism.

News Content Produced in Participatory Journalistic Contexts

Discussion of participatory journalism's content was almost absent from the initial studies on participatory journalism. Beginning in 2010, questions were cautiously raised about the impact that practices of participatory journalism could or might have on news content. Studies investigating the degree to which information from *participatory* sources was incorporated in professionally produced news were revealing: The vast majority of news items did not show or attract user interactivity. Traditional sources are still generally relied upon in routine news practices; only in extraordinary situations such as disaster coverage are information networks and user-generated content actively invited. Participatory journalistic content shows a movement toward a more subjective reporting style, soft topics, personal experience, and firsthand witnessing. Such covering of more informal relations and more soft news topics, in turn, generates more reader interactivity.

A 2019 study by Borger and colleagues found that in participatory journalistic environments that provide more freedom and encourage participation, participants move away from conventional journalistic understandings of objectivity and diversity. Academic researchers interpret this movement as boundary work: Participatory journalism challenges the boundaries of journalism, as it invites both rethinking as well as reinforcement of the conventions of traditional quality

journalism. Following the concept of public quality in popular journalism introduced by Irene Costera Meijer (2001), news that is produced in a participatory context represents public value in that it more often shows emotionality and experience rather than rationality; is based on proximity and involvement rather than detachment; and covers the private sphere and everyday life rather than or in addition to merely the public sphere and politics.

Impact of Participatory Journalism on Journalism

Since the impact of digital technology on communication became clear, throughout the world scholars, journalism practitioners, and participants have sought ways to materialize audience participation within the context of professional news organizations. Academic journalism scholars, professional journalists, and audience participants have each made their own version of participatory journalism that overlaps only in part with the others. These versions express different ideas and practices of what is *good* journalism and what is or should be journalism's function in democratic societies. Participatory journalism, in other words, is not a homogeneous phenomenon.

Especially in the Western context, participatory journalism often is not a part of what is seen as *real* journalism, both from the perspective of journalism practitioners and of participants alike. Following this consolidated conceptualization of journalism, the skill of professional journalists is acquired accumulatively by years of education and work experience in established journalistic organizations. Permitted their acquired skill, professional journalists select and present news in its proper form. The contributions of participants in the audience are merely complementary to this *real* professional journalism. Yet, this conceptualization is not pervasive or static.

In spite of the persistence of traditional conceptualizations of good journalism, participatory practices have developed in at least three types of contexts. First, in non-Western contexts where democracy is challenged, information-sharing communities as alternative channels of representative and relevant information pop up. Second, participatory journalism can develop in hyperlocal

contexts, where individual audience members establish their own criteria for what is relevant news: *softer*, more subjective news. Third, in situations of disaster or crisis, it is more likely for adaptive organizations of information producers to develop. For instance, during the COVID-19 outbreak in 2020, a Dutch public broadcasting organization (BNN-VARA) launched *Frontberichten* (*Frontline messages*) as an initiative to collect, select, and broadcast vlogs with COVID stories from health workers in hospitals.

In all of these settings, *professional* and participatory journalists negotiate what journalism should look like, what its goals are, and how it should be practiced. Digital media affordances will continue to arise from new technologies and applications, allowing participant journalists to merge with professional journalists and together renegotiate the function of journalism in society: A journalism that is very likely to express an increased degree of subjectivity and personal particularity, at the cost of a general journalistic claim on objectivity and public validity; in short, a journalism that is *closer* to both makers and users rather than farther away, and wherein makers and users are closer to each other rather than farther away, increasingly fulfilling roles as mediators of their communities (Anderson, 1983). To conclude, participatory journalism has not yet, as envisioned by scholars around the turn of the century, been established as a dominant journalistic value and practice; but by small scale steps, benefitting from at present unforeseeable technical and societal opportunities, it is due to change the face of journalism in other, more piercing ways.

PARTISAN PRESS

The term *partisan press* refers to journalism practiced within a political sphere, as opposed to a more independent profession. Partisan journalism

is connected with democracy, a form of government that has contested political leadership. It is not found in single-party or dictatorial states. In the United States, the partisan press era began after the Revolutionary War and lasted until the Civil War. During that period of time, the majority of American journalists worked for newspapers with definite political leanings, and many newspapers were started by the parties themselves. After the Civil War, the American press gradually moved away from its partisan roots and became more independent, although newspapers retained an editorial page where partisan perspectives remained on display. This entry first discusses the partisan press era in colonial America and the early United States and its decline by the end of the 19th century. It then looks at present-day partisan news media in the United States and Europe.

Partisan Press in Colonial America and Early United States

In the colonial period, Benjamin Franklin played a key role in the distribution of newspapers. As first postmaster of Philadelphia and then of all of the colonies, Franklin provided some newspapers with reduced postage for circulation in the colonies. Franklin eventually decided to let all newspapers be dispersed by the postal system for a very small fee. By the time of the revolution, newspapers in the North American colonies were divided between those that were loyal to the British government (Tories) and those who supported independence (Patriots). Very few newspapers were independent at this time.

When the Continental Congress began to convene, it turned to editors to record what transpired. In turn, editors shared this information with the public. Later, President George Washington signed the Post Office Act of 1792, providing for delivery of a newspaper for one cent of postage up to 100 miles and one and a half cents for more than 100 miles. The postal subsidy helped enhance paper circulation both in the colonial and postcolonial periods.

The heyday of the American partisan press came in the half century from 1783 until 1833. This period is when news editors received significant patronage from political parties, often via government printing contracts. Editors often

turned to parties for financial resources in order to start and maintain a newspaper. In return, the editors would endorse the political party's candidates and provide commentary favorable to its principles and positions on the issues of the day. The journalists' main job was to develop and motivate the party base. In turn, parties supported editors by asking their members to subscribe to those newspapers. This arrangement gave an editor, who also served as printer, writer, and business manager, a level of prestige and influence in society, and political patronage was critical to the newspaper's long-term financial stability.

During President Thomas Jefferson's administration, Samuel Harrison Smith, founder and editor of the *National Intelligencer* in Washington, D.C., received thousands of dollars each year from the State Department for publishing its official documents. Smith's favorable treatment was because of his loyalty to both Jefferson and the Democratic-Republican Party and eventually landed him a cabinet post, secretary of the treasury. Similarly, Philip Freneau launched the *National Gazette* and Benjamin Bache the *Aurora* as newspapers that opposed John Adams and the Federalists. Jefferson, who favored a weak centralized government, was a major supporter of the *Gazette* and often edited the newspaper for Freneau. On the other side of the spectrum, John Fenno published the pro-Federalist *Gazette of the United States* and William Cobbett, closely aligned with Alexander Hamilton, who favored a powerful federal government, edited *Porcupine's Gazette*.

In the first decade of the partisan press in the United States, newspapers had to survive the Sedition Act of 1798, passed by Congress during the presidency of John Adams, a Federalist. The law was part of two congressional bills that attempted to squelch printed sentiment for France, which was in the midst of a revolution. It also was an attempt to silence the journalistic supporters of Jefferson, then the vice president and a friend of France. Jefferson financed several Democratic-Republican newspapers, while rival Hamilton did the same for Federalist journals.

The Sedition Act was supported by Hamilton-leaning papers and opposed by Jefferson-leaning organs. The bill criminalized seditious libel. If convicted of criticizing the federal government, a journalist could face 2 years in jail and a fine of

up to \$2,000. The Federalists claimed they were trying to rid the nation of false and malicious news. Republicans countered that the law made it illegal to write about political issues. They argued the law made it impossible for citizens to obtain information and opinion that would help them make rational decisions at the ballot box.

Several Democratic-Republican editors, many of them directly linked to Jefferson, were prosecuted under the Sedition Act, but Jefferson, after narrowly defeating Adams in the election of 1800, let the renewable law expire. Jefferson believed written criticism of the government did not necessarily lead to revolution and that the press could serve as a check on the abuse of power. The weakness of such hyperpolitical journalism is that there rarely was any moderate ground for readers to consider. The rhetoric was vitriolic and often more about the man than the ideas or principles behind a particular political issue.

The partisan press era coincided with extensive growth in American journalism. In 1783, the newly independent nation had only 35 newspapers. In those days, it was not unusual for those newspapers to be shared several times, especially in taverns, creating a large but unaccounted for secondary circulation. Fifty years later, the United States had 1,200 newspapers. The nonadvertising content of the partisan press era was primarily political news, interpretation, and stories about key politicians. This included editorials that urged readers to support candidates from the newspaper's party. The newspapers of that era also included lively and even abusive rhetoric slung at political opponents. Those personal attacks could be vicious, and they were often entertaining. During the election season, newspapers prominently displayed the names of a party's ticket, starting at the national level and working down through state and local races. Editors also printed speeches of major national and state political leaders as well as significant government documents, including sessions of state legislatures and governors' decrees. In the first half century of American journalism, most editors exchanged their newspapers with other editors because of a break in postage costs for printed material. This led to the cutting and pasting practice whereby smaller rural or town newspapers borrowed from the larger newspapers in urban centers.

The concept of having a press representing multiple political parties derived from the Enlightenment, particularly the political philosophy of John Locke and Thomas Paine. Locke believed that individuals should have the right to speak and write freely and that government should not interfere with public discourse. Locke, who was hopeful about human potential, also held that an open exchange of ideas would lead to political harmony—that it would unite rather than divide. Paine's writings, both pamphlets and broadsides published during the Revolution, were highly influential. Paine was a republican who wanted the Americans to break free from the political bounds of Great Britain, from the tyranny of the monarchy. That Paine wrote passionate pleas of independence was an active example of free expression. By having the temerity to urge Americans to break away from London, Paine was making the case of open and independent discourse and freedom of the press.

The ideas of Locke and Paine were filtered through the Founding Fathers, especially James Madison. His understanding of individual rights was expressed best in the First Amendment, which guarantees no interference from Congress regarding freedom of the press—that right to publish as one pleases. This meant that there would be no official newspaper of the federal government. Not having an official government journal was parallel to the idea of not having a single state religion.

The first 50 years of partisan journalism in the United States coincided with the first two party systems in the United States. First came the contest between the Democratic-Republicans and Federalists, followed by the battle between Democrats and Whigs. Editors, many of them politicians themselves, lined up on each side of these political divides and interpreted events of the day within the ideology of a particular party. Politicians frequently owned newspapers, and editors sometimes became politicians. Alexander Hamilton printed the pro-Federalist *Gazette of the United States*. In addition to their political experiences, Benjamin Franklin and Samuel Adams also were known as printers.

With the formation of the Whig and Democratic parties in the 1820s, editors continued to be major political players. No politician in the first

75 years of the nation's history was more reliant upon partisan editors than President Andrew Jackson, who bestowed federal jobs on at least 40 journalists during his administration. In the middle of the 19th century, Henry J. Raymond served in the New York legislature before founding *The New York Times*, and *New York Tribune* editor Horace Greeley would run for president after the Civil War. Abraham Lincoln owned a newspaper, a German-language organ that supported the Republicans.

During the Nullification Crisis of 1831–1833, partisan journalists had a major role in framing the issue and were bitterly opposed to one another, especially in South Carolina. In the Palmetto State, the newspapers did not necessarily align as Whig versus Democratic. Rather, the battle was over protectionism against free trade. On the side of protective tariffs for American goods were the so-called Unionists. On the other side, favoring free international trade was the Nullification Party. The latter believed South Carolina had the right as a state to opt out of federal laws that were not in its vested interest. Hence, federal laws could be nullified at the state level. Newspapers on both sides of this divide fashioned the arguments for their side and rallied their followers to vote accordingly.

The *Charleston Mercury* claimed the tariffs in effect enslaved South Carolinians to a policy that went against their economic interests, particularly because the tariffs had an adverse effect on the state's main commodity, cotton. If the federal government would not provide tariff relief, then it was the right of South Carolina to ignore the federal law. The pro-nullification editors often argued that their side in the tariff crisis had a precedent: The Revolution of 1776. Like the Patriots, the Nullification Party members said they faced a tyrannical oppressor and therefore had a right to interpose a state's right to void a federal law.

In the 1850s and 1860s, the partisan press in the United States helped stoke the political convulsions that led to the Civil War. Editors were not aligned in simple camps in either the North or the South. The parties began to splinter apart, and candidates representing four different parties ran for president in 1860. In the South, newspapers were not all

supportive of conservative, pro-secession Democrats. There were old-line Whigs who preferred some sort of compromise, and in the upper South, there were those who thought the Union was indivisible. In the North, the Republicans were split between moderates and radicals, while the Democrats were split between loyal Unionists and conservatives who preferred peace to a bloody war that pivoted on abolition. The partisan press of the antebellum and Civil War period tended to conserve the views of these factions.

The political-oriented newspapers of the era were now joined by the advocacy press. The leading advocacy group of this era was the abolitionist press, led by such editors as William Lloyd Garrison, Frederick Douglass, and Gamaliel Bailey. In this period, partisan editors, both Democratic and Whig-Republican, considered the abolitionist press to be too radical, too fanatical, and too politically naive, and argued that abolitionism was a disease that would deepen the nation's sectional divide and make civil war all but inevitable. At this time, the partisan press was the mainstream press of the nation, and its reaction to the abolitionist editors tended to be critical. Few partisan editors in the antebellum condemned mob violence against abolitionist journalists, such as the murder of Elijah P. Lovejoy in Alton, Illinois, in 1837. At least until 1860, this was due in no small part to the fact that both major parties had to have some support from the opposition to win national elections.

Decline of the American Partisan Press

The American partisan press began to die out in part because of the power of the telegraph, which could churn out vast sums of information over long distances. It became more important to get the facts out first, and lots of them, as the United States grew internally and became more influential globally. News, not political interpretation, became the centerpiece of the journalistic enterprise. Increased emphasis on news in the latter half of the 19th century was coupled to an expansion in the size of newspapers from four to eight to 16 pages.

Publishers also began to move away from the partisan business model, as advertising became

the new economic engine for newspapers and magazines. Likewise, the press in the United States became more industrial and could crank out more and more copies of a newspaper because of improvements in the printing press, which meant readership increased dramatically. Hand in hand with that was the rise of literacy and the universal common school movement. In the last few decades of the 19th century, sensationalism took the place of partisan politics as the salient feature of American newspapers. There was a political dimension to the sensationalism—often toward progressivism—and yet the emphasis was on information for an increasingly urban and industrial population. Readers wanted unfiltered news to navigate their everyday lives. Politics still mattered, but not as much as accidents, crime, health issues, and train schedules.

Partisan Media in the 21st Century

Outside of the United States, there is a somewhat different understanding of the press. For example, in Great Britain, the practice has long been that newspapers have definite political stripes and that such identity has an effect on the entire newspaper. Such is also the case in French journalism, where readers tend to be loyal to newspapers based on their political leanings. This is not to say the European models do not give readers information that helps them surveil their everyday environments. Rather, that model takes it as a given that the editorial leadership matters the most.

Partisanship subsided by the mid-20th century in U.S. news media, though it continued in political magazines such as *The Nation* on the left and the *National Review* on the right. It began to make a return in the late 20th century with the proliferation of conservative talk radio shows and the launch of Fox News on the right, followed later by the formation of partisan websites on both the left and right as well as a move toward left-leaning programming on MSNBC.

PATRIOT ACT

The USA PATRIOT Act (full name: Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism Act of 2001) was a law passed overwhelmingly by Congress on October 24, 2001. Two days later, President George W. Bush signed the act into law creating legislation that gave sweeping new powers to government to collect information that could thwart potential terrorist attacks against the United States.

In 1996, President Bill Clinton asked Congress to give law enforcement expanded wiretap authority and increased access to personal records in terrorism cases. This request occurred shortly after the Oklahoma City bombing in April 1995. Congress refused, citing concerns that loosening surveillance rules would be unconstitutional. However, in the wake of the horrific attacks on the World Trade Center and the Pentagon on September 11, 2001, Congress was ready to act. The Bush administration drafted legislation to expand powers of government to investigate and detain suspected terrorists and to increase the powers of law enforcement. Different House and Senate draft bills were merged into a compromise

bill that greatly expanded the ability of law enforcement to seek information in the course of federal investigations against acts of terrorism, both foreign and domestic.

Additional powers given to law enforcement included:

The use of surveillance and roving wiretaps for computer and terrorist crimes, for money laundering, immigration, and other potential criminal areas. Roving wiretaps occur when a court grants surveillance warrants without naming either the communication carrier and/or other third parties involved in the operation.

The ability to subpoena telephone subscribers' credit cards or bank account numbers to prevent money laundering.

The use of trap-and-trace devices, which can record source and destinations of calls made to and from a particular telephone.

In addition, law enforcement was not required to show probable cause to initiate surveillance under the act but only certify that the information sought was likely to be relevant to a criminal investigation. The law also made changes to the way the Foreign Intelligence Surveillance Court operated, specifically removing the previous requirement that the government certify in its application that the "purpose of the surveillance was to collect foreign intelligence information." Finally, the act ended the statute of limitations for certain terror-related crimes.

The new law was aimed at improving homeland security by providing law enforcement with expanded tools to track terrorists. However, many of the controversial requirements of the PATRIOT Act were slated to expire in 2005 unless Congress and the president chose to renew them.

Many civil liberties organizations expressed deep concern about the law and the potential for law enforcement to abridge civil and privacy rights of Americans. The American Civil Liberties Union complained that the act made it easier for government to spy on ordinary citizens because law enforcement now had authority to monitor phone and email communication, collect bank and credit card records, and track activities on the Internet. Others complained that the act eliminated checks and balances that previously gave the courts the opportunity to ensure that law enforcement powers were not abused.

One section of the act that was particularly concerning to civil liberties organizations was Section 215. This section of the act modified part of the previously enacted Foreign Intelligence Surveillance Act. The language of Section 215 allows for the Foreign Intelligence Surveillance Act court to approve orders to collect “tangible things” that could be relevant to a government investigation. The list of what could be included as “tangible things” was broad and included books, records, papers, and documents. These provisions have been interpreted to permit the bulk collection of “telephony metadata” (mass collection of call log information without personal identification). Thus, if an issue with a particular number is raised and that number is attributed to a U.S. resident, that information could be passed to the FBI, which then could use publicly available information to connect the number with the subscriber information. It is this bulk collection of data under Section 215 that critics claim violates individual rights since “tangible things” could mean anything from driver’s license records to Internet browsing patterns. Section 215 has been reviewed and renewed by Congress since 2006, and the Supreme Court has ruled that phone records are not considered privileged information for purposes of the Fourth Amendment to the U.S. Constitution. On March 15, 2020, Section 215 expired due to its sunset clause after lawmakers failed to reach an agreement on a broader set of reforms to Foreign Intelligence Surveillance Act.

Despite growing concerns about the implications for Americans’ civil liberties, Congress has reauthorized most sections of the law several times since 2005. But sections of the law have met with legal challenges. In the case *Doe v. Mukasey*, a federal judge ruled in 2004 that parts of the law violated fundamental constitutional safeguards by allowing federal agencies to gather information about U.S. citizens secretly under national security letters without court approval. Congress modified sections of the law and made many of the provisions that were originally temporary permanent in May 2006. But the following year, the same court ruled that the new version of the act gave federal investigators powers to spy on individuals that were unconstitutionally broad. The federal government appealed the lower court decision and the Second Circuit U.S. Court of Appeals upheld the

lower court ruling and said that the “gag orders” imposed on recipients of national security letters were a violation of First Amendment rights.

In 2010, the U.S. Supreme Court took up the question of whether monitoring some terrorist activities violated the First Amendment to the U.S. Constitution. While the Court upheld the constitutionality of the “material support” statute that criminalizes support for any foreign terrorist organization designated by the U.S. secretary of state, the Court also noted that other aspects of the law remain untested and may not be constitutional.

In 2013, Edward Snowden, a former government contractor, released documents that revealed that the federal government was using Section 215 as justification to collect phone records on virtually all U.S. phone customers. These leaks put Section 215 at the center of a renewed controversy and led to a series of investigations related to programs that the government uses to collect information related to foreign and domestic terrorism. While Snowden has been called both a hero and a traitor, the documents leak brought into focus the fact that the PATRIOT Act has made it possible for the government to develop large-scale data collection programs.

The USA PATRIOT Act was passed quickly and with little debate. The Senate bill closely resembled the language put forward by the attorney general, while in the House a more moderate compromise bill was rejected and replaced with legislation that closely followed the Senate bill. The Bush administration lobbied hard for passage and implied that Congressional members who did not support the bill could be blamed for further terrorist attacks, if they were to occur.

In 2004, speaking before the U.S. Senate Committee on the Judiciary, FBI Director Robert Mueller claimed that the PATRIOT Act had been beneficial in the war on terrorism and that many counterterrorism successes were the direct result of provisions of the law. The presidential administrations of Barack Obama and Donald Trump also supported the PATRIOT Act. In 2019, the Trump administration called upon Congress to renew Section 215 of the act indefinitely, saying that future technological innovations will emerge to make the act more useful over time. But according to the American Civil Liberties Union, despite the widespread use of tens of thousands of

national security letters between 2003 and 2006, only one resulted in a terror-related conviction. Congress adopted some reforms to the law in the USA Freedom Act of 2015, which curtailed data collection.

Although modified several times over the years, the PATRIOT Act continues to provide federal law enforcement and intelligence gathering agencies tools to collect information to identify and fight potential terrorist activities in the United States. The Department of Justice has claimed that the act allows federal agents to follow sophisticated terrorists trained to evade detection and to conduct investigations without tipping off terrorists. The law also facilitates information sharing and cooperation among government agencies, increases penalties for those who commit terrorist crimes, and updates the law to use new technologies. Critics of the law complain that it tramples on Americans' constitutional rights, collects data on citizens without their knowledge, and is excessively costly without providing the benefits it was intended to provide.

PAYWALLS

Paywalls result from the need of news organizations to generate revenue streams from audience subscriptions. Since the arrival of digital media,

news organizations have faced an accelerated loss in advertising sales while Internet aggregators such as Google and Facebook have taken up an increasing share of advertising revenues (combined an estimated 80% share of digital advertising). Therefore, paywalls and strategies for getting people to pay for news subscriptions have become increasingly paramount for news organizations. This entry examines how paywalls work, the importance of studying paywalls and their impacts, and some notable successes and failures of paywalls.

The Operation of Paywalls

Setting up a paywall means that news organizations build a digital payment system that requires their audience to pay for subscriptions in order to access the content. Those who chose not to pay will have limited or no access to the digital content published by news providers. In Australia, the largest two print newspaper groups, News Corp Australia and Fairfax Media, have started experimenting paywall models since 2011. As of May 2015, 87 of the top 100 newspapers in the United States have implemented a paywall to their news website. In Europe, around two thirds of major news organizations have implemented paywalls to their digital platforms, as reported in 2017. Although the implementation of paywalls has been long and widespread, the audience market still has room for embracing paywall. In the 2020 Digital News Report, researchers collected data from the United Kingdom, the United States, and Norway. Only 7%, 20%, and 42% of users, respectively, self-reported having paid subscription to access online news content in 2019.

To ease audiences into paying for news subscriptions, many organizations have adopted “soft” paywalls to their content. In contrast to hard paywalls that block the entire content offering for people who do not subscribe, a soft paywall allows news audiences to access some content for free and ask them to pay for subscriptions for other content. Generally, soft paywalls fall into two categories: the freemium model and the metered model.

News organizations that employ the freemium model provide two types of content: free content open to the public and premium content for their

paid users. Examples of this model can be seen in Politico.com and The Chronicle of Higher Education. They both provide general news in their coverage domain (politics and higher education) for free. However, Politico.com provides a paid “Pro” version. Subscribers of Politico Pro can have access to legislative and regulatory trackers, customize their news feed, and request clarification from or chat with journalists from Politico.com about specific news stories. Premium content on The Chronicle of Higher Education offers in-depth coverage and analysis of the policy changes or university issues. Its subscribers can also access data and analysis on the latest enrollment trends and student demographics.

The second category of soft paywalls is the metered model. This subscription model allows users to have free access to five articles a month or free content for 2 weeks, and once a user hits the meter number, they have to pay for subscriptions to access more content. For example, Corriere della Sera, an Italian news outlet, offers 20 free articles each month. After reaching the threshold, people will be asked to pay for €9.99 per month to continue access to the content.

Importance of Studying Paywall

From the economics perspective, the markets for information goods and media content are often multisided, organized, and coordinated by digital platforms. In some sense, print news organizations that rely on advertising sales are early forms of platforms that orchestrated multisided markets. Today, news outlets are facing a more complicated form of digital multisided market. To fully understand the importance of studying paywall, one must understand the characteristics of digital multisided markets.

First, paywalls can influence both subscription revenue and advertising sales. The market of news, especially in a digitally based environment, is primarily affected by network effects. If a paywall is successful, the increasing number of subscribers will attract more advertisers, and it has been found that circulation or subscription revenue is positively related to advertising sales.

Second, pricing strategies for paywalls are important, yet it is hard for news organizations to charge a relatively high price. Given that digital

technology takes little to reproduce and distribute materials, the traditional distribution costs for content providers are negligible. Moreover, search costs, tracking costs, and verification costs will likely also drop significantly and probably approach zero in the digital economy. Such drastic declines in costs provide opportunities for content providers to lower their prices, and they are more willing to offer content for free to attract audiences and advertisers.

Since there is little room for price competition for paywalls, news organizations that employ paywalls tend to focus on the quality competition. When users can freely access many digital products and services, paid subscriptions must emphasize how they create and deliver unique value for their subscribers by improving the quality of their news products and services.

Paywall Failures and Successes

Earlier research has documented the failures of implementing paywalls. Some scholarship has examined paywall models in eight countries and found that paywalls were softening as newspapers struggled to attract digital subscribers. Other scholars in the United States also reviewed documented 69 newspapers that decided to drop their paywalls.

Despite these challenges, scholars also found factors that lead to online paywalls’ success for news outlets. Scholars found that perceptions of exclusivity, the proximity of location, and a strong connection with the local community lead to paywall success for a regional newspaper in Norway. This newspaper illustrated higher digital subscription income after the paywall was implemented. Researchers also suggested other factors of getting people to pay for news subscriptions, including news habits, attachment to the local community, desire to maintain and promote one’s social identity, and willingness to support news organizations in financial crisis.

Impacts of Paywall

The first and most direct impact of the paywall is its association with decreased page views and user engagement. With other free alternative content available, people may choose to view other free

content instead of paying for a subscription. The loss in page views and users also reduces audiences' engagement with the digital content and their time spent on digital news platforms. In the United States, local newspapers have taken the most substantial hit and reported drastic drops in website traffic after setting up a paywall (e.g., *Columbia Tribune*). Some national and international news outlets also experienced a considerable decline in page view and withdrew their paywalls (e.g., *San Francisco Chronicle*, *Dallas Morning News*, *The Sun*). However, it is essential to note that the negative impact on page views varies across topics. News providers with extensive coverage on business, economics, sports, and social news are more resilient toward decreasing page views. Research also found that to mitigate the negative impact on page views by the paywall, a 1% increase in business news coverage is about 1.4 times more effective than adding the same proportion of social news coverage. In addition, news organizations with a more liberal view and niche content area are also found to be less affected by paywalls.

Secondly, as paywalls cause news organizations to lose audiences, concerns are raised for paywalls' detriment to the press's civic function. The decrease in page views and readership challenges and weakens news organizations' democratic functions in informing the public, monitoring the power mounts in society, and providing a public sphere for open debate and discussion. In this sense, setting up a paywall can hinder journalism and its democratic tasks in representing and benefiting the public. However, paywall scholars also argue this harm is trivial as other news outlets offer similar content for free. In some instances, news organizations also drop paywalls to keep the public informed. For example, as an act of their mission to inform the public, several news organizations (e.g., *The Seattle Times*) offered free access to their coronavirus coverage during the COVID-19 pandemic in 2020.

The third most significant effect of the paywall is its "spillover effect" on print readership and subscription revenue. The spillover effect indicates the positive impact of print readership and print subscription and circulation revenue after implementing a paywall. When news organizations offer free digital access with print newspapers,

news consumers could perceive the print subscription to be more valuable to purchase. In addition, when audiences use digital versions and print versions of news as substitutes, the increased price of paywall could motivate people to purchase the print version that is relatively less expensive and of higher value. Thus, the implementation of paywall also contributes significantly to saving the print revenue and slowing print readership decrease. The empirical evidence of the spillover effect can be seen in research about *The New York Times*, where researchers suggest an overall positive influence of paywall amounting to 29.3% of total circulation and 23.31% of print subscription revenue (Pattabhiramaiah et al., 2019).

Another crucial impact of paywall lies in its sway on the content strategies of news organizations. Since the underlying assumption of the paywall is that audiences are willing to pay for news content that is valuable to them, what content is "valuable" and can be charged by a price vary across news organizations. For example, some news outlets offer opinion sections for free, while other news organizations put editorials behind the paywall. It is also generally accepted that hard news and premium content such as finance and politics are more suitable to put behind the paywall. To make the content more "paywall-worthy," news organizations also endeavor to produce quality journalism and encourage reporters to employ exclusive sources and materials in their coverage. The impact of the paywall on journalism gatekeeping and news values are argued to be neglectable, yet further studies need to be done to test this assumption. As of free content, news organizations tend to offer general interest news for free because people can easily find free alternatives elsewhere. Also, news organizations are more likely to use wired stories and syndicates on their digital platform for free due to the fear of losing users, website traffic, and potential advertisers to their competitors by putting up paywalls.

Also, it has long been argued and illustrated that the revenue directedly generated by paywall is not substantial enough to cover news organizations' loss in digital advertising and print circulation revenue. Some scholars hence challenge the capability of paywalls being a sustainable business model for news organizations both in the short term and in the long run. However, in recent years,

studies have shown that there is a positive relationship between people's entertainment spending and paying for news subscriptions on digital platforms. Such positive association suggests the market conditioning for paying for digital media content, meaning that the public are getting used to pay for digital media content whether is streaming video or news stories.

PEACE JOURNALISM

Peace journalism, according to its advocates, is a way to report on conflict without increasing the conflict itself. This sounds simple, but its application would surely change the nature of journalism because of a reporter's orientation to conflict as news. Therefore, perhaps the easiest way to understand peace journalism is to examine it in opposition to the prevailing ways of covering war and conflict. (Some authors even refer to typical journalism as “war” journalism because of the journalistic practice of framing conflict in terms of trying to discover who is winning and who is losing.) A criticism of peace journalism is that it expects journalists not only to take sides but also to advocate for peaceful resolutions of conflicts.

The ideas promoted by peace journalism's advocates are best understood in contrast to journalism as it has been traditionally practiced. Advocates for peace journalism admit that the phrase itself suggests that they are advocating peace. Instead, they say that they hope to “give peace a chance” by ensuring that nonviolent responses to conflict also are covered by journalists (Lynch and McGoldrick 2005, xxi). For example, one “How to do it” list on the web begins: Avoid portraying a conflict as consisting of only two parties

contesting one goal (xxi). The logical outcome is for one to win and the other to lose. Peace journalists, instead, would separate the two parties into many smaller groups, thereby opening creative potential for a range of outcomes.

Opposing Side-Taking

Peace journalism uses conflict analysis and transformation to achieve fairness and accuracy in reporting. As suggested here, traditional journalism seeks to present opposing sides to a problem; the peace journalist hopes to encourage the understanding of multiple positions to each potential conflict. Peace journalism advocates explain that journalism as it has been practiced in the United States encourages the taking of sides even when that is unnecessary. Because of this craft tradition, reporters who cover war are blind to anything except a polarized presentation of the news. In turn, this polarized approach accelerates conflict.

Practical tips and suggestions for changing the way a reporter covers conflict are included in a textbook written by British former war correspondents Jake Lynch and Annabel McGoldrick. As they present the material, among the first steps in analyzing conflicts is a process they call “mapping the conflict.” Pointing out the effects of language choices of winning and losing, they offer simple lessons in empathy—discovering common ground and common visions for the future and looking beyond slogans and positions to identify opportunities for dialogue.

Lynch and McGoldrick use modern examples to help explain how peace journalism has defused or could defuse conflicts. A useful example is the centuries of conflict between Britain and Ireland. As they note, stopping the fighting does not bring harmony nor does it mean that all disagreements have been resolved.

Many of the tips for reporters who would follow peace journalism’s processes are framed in ways to “avoid” certain patterns of speech that can lead to the escalation of violence. Examples are the avoidance of the following: assessing the merits of a violent action in terms of policy; letting parties define themselves by quoting a leader’s demands or positions; asking about what divides the parties; only reporting violence and describing the horrors; assigning blame and highlighting the fears and grievances of one party; and most importantly,

using victimizing language such as “destitute,” “defenseless,” or “pathetic.” Other language to avoid is the imprecise use of emotive words (“genocide,” “decimated,” “massacre”), adjectives such as “vicious” or “brutal,” and labels such as “terrorist,” “extremist,” or “fanatic.” Indeed, if the authors of *Peace Journalism* have their way, journalists will need to change more than their language—they will need to become more analytical and their editors must let them.

Opponents of peace journalism say that it is an (unwelcome) shift from objectivity and offer other important analyses, as well. Canadian researcher Robert Hackett has attempted to analyze the production of news and its complexities in relation to the concept of peace journalism. He carefully sets forth the arguments of both the peace-journalist advocates and their critics, with the arguments of the latter including that the peace journalism movement fails to take into account the effects of the actual dynamics of news production.

One Antiwar Correspondent

A reading of some of the advocates against war adds to an understanding of the defusing process. One of the most interesting—and least self-righteous—is a collection of war reporting by Martha Gellhorn called *The Face of War*. Even though it covers wars from 1937 through recent conflicts, it offers surprisingly modern views. The overall tone is antiwar or perhaps pro-human, as well as deeply humane.

Gellhorn, who reported the Spanish Civil War in the 1930s through the Vietnam War 30 years later, has been more known for being the third wife of Ernest Hemingway than for her writing. However, new critical attention may shift the understanding of her international importance. Her pieces are personal and are not as dated as much war correspondence because she does not write about military tactics. Caroline Moorehead, author of *Gellhorn: A Twentieth Century Life*, says the correspondent was most interested in describing the effects of war on ordinary people.

Peace Advocacy as History

Nineteenth century press historians have compiled studies of peace advocacy and the press, and it suggests that much journalism at the time was a form of advocacy and that many publications were

often strident in their activism. Indeed, access to different peace approaches can be found in archival copies of peace journals such as the *Messenger of Peace* and the *Herald of Peace*. Often romanticized or considered quaint, these Quaker advocates for reform were courageous in the face of taunting and in the possibility of physical danger.

Scholars of diplomatic and military history have dominated the field of possibilities for peace history, yet many opportunities for future research by journalism historians exist. Like the frames available to war correspondents, the military historians have not found the peace press provocative or compelling enough, according to journalism historian Nancy Roberts. But peace societies at their inception saw the need for publications to cover the issues which were left out of popular publications. Hence, much of the information about the peace press must be gathered by reading peace periodicals themselves.

Roberts outlines a sampler of peace advocacy publications available at the Swarthmore College Peace Collection. Included are publications that date from 1828. For current topical information, information and articles are available from the website of the interfaith peace organization Fellowship of Reconciliation USA (FORUSA). Historian Merle Curti has written of earlier peace periodicals that their study is important because they usually contain the annual reports and addresses which earlier were circulated in tract form. Additionally, a tradition of antiwar journalism and an important archive of antiwar newspapers exist, but they are separate from the peace journalism phenomenon. Both historical studies of peace publications and further analyses of the peace journalism phenomenon are needed to better understand these challenges to the practice of journalism.

PENNY PRESS

Urbanization, industrialization, immigration, and massive population growth fueled the emergence of the penny press in the United States during the 19th century. With its emphasis on news of interest to non-elites, the penny press redefined news as the unusual, the bizarre, and the sensational. The penny press contributed to changes that would define American journalism for more than 100

years. It stimulated an interest in current affairs and reading among American citizens. It also produced some of the most legendary editors and reporters in the history of American journalism: James Gordon Bennett, Horace Greeley, and Henry Raymond, to name perhaps the three most prominent.

While most penny papers have long since folded, a few still remain in publication today. Those include *The New York Times*, *Boston Herald*, *Baltimore Sun*, *The Times-Picayune* in New Orleans, *Savannah Morning News*, and *Richmond-Times Dispatch*. This entry discusses the origins of the penny press, factors in its popularity, and its key characteristics.

The penny press ushered in the age of the mass society and mass media that met the information needs and goals of the public and led to an age of “democratic reading,” according to historian Isabelle Lehuu (2000, p. 36). Its seeds would not fully blossom until the end of the 19th century, and it was a form that would never take root outside of urban centers, but the penny press would make news of a type available to all takers.

Some, such as journalism historian John Nerone, argue that the penny press was not a revolution in journalism practice but a mutation. In Nerone’s view, the changes in journalistic practice represented by the penny press are more “responses to changes in specific environments rather than discoveries of fundamental human truths (e.g., the people want news, not opinions) or new principles (e.g., political independence)” (Nerone, 1987, p. 377). In other words, he argues the change in newspaper practices was a response to a change in the social environment. Whether revolution or evolution, the penny press represented a shift in both definitions and practices of journalism.

Origins

The penny press began with the first issue of the *New York Sun*, which appeared on September 3, 1833. Editor Benjamin Day declared in his opening editorial that the paper would provide “ALL THE NEWS OF THE DAY” at a price—1 cent—that anyone could afford. Standard newspapers, which typically cost six cents, were out of the reach of the average working person. Day hit on a

gold mine. Within 2 months, the paper had a circulation of 2,000. In 1836, the paper claimed to have a circulation greater than that of 11 of its more elite six-cent competitors. Five years after its founding, in 1838, the paper claimed to have a circulation of 30,000.

Day was not the first to experiment with this new newspaper formula. Penny newspapers, and even magazines, were already publishing in England by the early 1830s. In the United States, as early as 1826, some newspapers were already expanding their definition of news to include the topics the penny press thrived on. One example is the *Boston Transcript*. In late July 1830, Editor Lynde M. Walter and his partners brought out the *Transcript* as a penny paper. He had to suspend it after 3 days, however, to have more time to build up advertising and subscriptions. The suspension lasted about a month. By the end of August, the paper was back on the streets. It was not a typical penny paper, however, for its subject matter was more literary. Walter ran the paper until his death in 1842, at which time his sister, Cornelia Wells Walter, formerly the paper’s theater critic, took over the editorship. She ran the paper until 1847 and was one of the first women to edit a major city daily.

The *Sun* was published from September 1833 until 1950. The paper’s slogan was, “It Shines For All.” The paper focused on publishing news that would interest ordinary people—suicides, deaths, crimes, and divorces, and it defined reporting as storytelling. This *Sun* demonstrated that a newspaper could succeed on individual sales and advertising instead of high-priced subscriptions, which was the more common marketing strategy most journals used. Day’s objective was to publish a paper that provided news at a price anyone could afford. Another of Day’s innovations, borrowed from England, was street sales of individual copies by newsboys. The *Sun* began publishing during an economic downturn, but it was an immediate success, proving Day’s formula and price were appropriate for an urban audience.

Besides its low price and tabloid size, penny newspapers differed in some ways from the more typical staid political press in its offerings. Rather than publishing long political harangues from editors who were tightly knit into political party structures, penny newspapers covered sports,

crime, sex, society, gossip, and religion on the local, national, and international levels. They appealed to emotions and were rather moralistic in their coverage, in that they focused on stories taught moral lessons while avoiding those that were shameful or immoral.

Human interest stories with an emphasis on crime news were another hallmark of the penny press. Covering crime news was an important component in the development of another penny press innovation: reporters. The elite press relied on in-house editorials and correspondence, some paid and some not, from outsiders for content. Penny newspapers produced in-house content as well, but its different definition of news required men to go out to courts or police stations and gather news directly from the source rather than waiting for it to come to them in their offices.

Factors in Popularity

Several factors contributed to the rise of the penny press. First was the massive growth in the U.S. population during the early 19th century, fueled largely by immigrants who flocked to American cities, particularly those in the northeast such as New York, Philadelphia, and Boston. In his opening editorial in 1851, Henry Raymond, editor of *The New York Times*, wrote that the city's growing population was one factor in the decision to start another daily newspaper in the city. Literacy rates were on the rise as well. These two factors produced an ever-expanding audience for news. Another vitally important factor was the development of the steam press, which allowed for huge numbers of copies to be printed. While the older hand presses might be able to strike off 350 papers a day, steam presses could produce up to 4,000 pages in an hour.

This was a period, too, of democratization in the United States. After traveling in the United States in 1831, Alexis de Tocqueville wrote about how engaged with their democracy Americans were. He reported that they always had their noses in a newspaper and that they were always joining associations. Contemporary historians have made similar observations. Glenn Altschuler and Stuart Blumin have written that American citizens in the 19th century were highly engaged with public life, that they paid close attention,

and that they had a deep and broad understanding of the day's issues. The working poor may not have been interested in the same issues as the political and business elites, but they were interested in what was happening in their communities, and that interest helped build an audience for the penny newspaper. Some have even seen the rapid growth and expansion of the cheap press as a product of American individualism and independence.

Key Characteristics

New York City became the center of operation for this new kind of newspaper. Before long, Bennett's *New York Herald* and Greeley's *New-York Tribune* would follow. About a decade later, Raymond and George Jones would found *The New York Times* as a penny paper. Journalists in other cities followed suit and established penny newspapers in Baltimore, Washington, Philadelphia, Boston, New Orleans, Richmond, Baltimore, and even Savannah, Georgia, during the 1850s.

These newspapers were highly competitive. In 1838 and 1839, Bennett, for example, established a pigeon express between Washington and Baltimore and a pony express between Washington and New York. He made arrangements with other editors to attach news bulletins to pigeons and fly them off to New York. Even when the telegraph came online a few years later, the pigeon coop remained atop the *Herald* building. The *Herald's* competitors despaired of ever competing with that paper's speedy acquisition of news, and one, the *Journal of Commerce*, eventually gave up and created a cooperative agreement with the *Herald* that would become instrumental in the creation of the Associated Press.

The *Herald* also was important in developing American war reporting. It was the only New York newspaper to send a correspondent to cover the Mexican-American War, and the paper made extensive use of the telegraph to provide the latest news as fast as possible. During the American Civil War, the paper maintained a corps of war correspondents and even opened a Southern desk. The paper's correspondents went to great lengths, including using couriers, to ensure news got back to the New York office in less than 36 hours.

These newspapers marked a radical change in the nature and definition of news. The newspaper was established as a democratic, capitalist institution with ownership firmly in the hands of individuals. While these newspapers focused on sensational topics, they were not entirely disconnected from politics. Their editors were heavily involved in politics, and that would not change, though politics was not the be-all and end-all concern of their newspapers. Their political activities, however, were of their own choosing and not, like the 19th century political press, determined by party leaders. The two different forms of journalism competed side-by-side.

The penny press is sometimes credited with introducing the concept of objectivity into news, but while some stories might have been treated objectively, objectivity was not truly a value of the penny press. One has only to look at a story like the Great Moon Hoax to realize that. The Great Moon Hoax was a serialized story published in 1835 by the *Sun*, probably to help circulation grow. The stories maintained that astronomers had developed an extraordinary new telescope that had allowed them to discover life on the moon, and they detailed the nature of that life, including men with bat-like wings and a biped beaver that lived in huts and were seemingly acquainted with the domestic use of fire. The story was attributed to a work allegedly published in the *Edinburgh Journal of Science* by Sir John Herschel. Readers may have heard of the journal, because it had, in fact, existed. However, at the time of the Moan Hoax, the journal had been defunct for some 2 years. The article was actually the brainchild of *Sun* reporter Richard Adams Locke.

Both readers and, and other newspapers fell for the hoax readers and other newspapers. The *Herald* had been out of commission for about a month due to a fire at its offices. When it came back into print, Bennett wrote an article casting doubt on the story. Locke denied the story was a hoax. The story made Locke enormously famous and brought in many new readers for the *Sun*.

The penny press also served an important function in spreading information so that all Americans could participate in their democracy. Circulations of these newspapers were orders of magnitude larger than their political or religious

brethren. *The New York Tribune*, for example, achieved a circulation of more than 200,000, at a time when the average newspaper would have a circulation of maybe 1,000 to 2,000. While penny papers had greater political independence than the partisan press, they carried political content that would have helped immigrants understand more about American politics and encouraged them to get engaged with the political system of their new country. The rise of the penny press, which resulted in the creation of a mass press, helped to diversify those who embraced and were embraced by the moniker "American."

PENTAGON PAPERS

The "Pentagon Papers" is the name commonly used to refer to the *Report of the Office of the Secretary of Defense Vietnam Task Force*, commissioned by the U.S. Department of Defense in

1967. *The New York Times* and the *Washington Post* began publishing portions of the report in 1971, which led to the first-ever federal injunction to stop a publication when the administration of President Richard Nixon claimed publication constituted a threat to national security. In a 6–3 decision, the U.S. Supreme Court found that the government had not met the “heavy burden” of proof required in cases where the government wants to restrain speech prior to publication. This entry first discusses the report, its publication, and the government efforts to stop publication. It then looks at the Supreme Court ruling allowing publication of the report and some of the results of the publication.

The Report

U.S. Secretary of Defense Robert McNamara requested a historical analysis of the Vietnam War and created a Vietnam Study Task Force in 1967. Three dozen analysts were involved, from academia, the federal government, and the military. The report was completed early in 1969, when McNamara was no longer Secretary of Defense, so the report was delivered to his successor Clark Clifford. The final report was more than 3,000 pages and was classified “Top Secret.” In addition to the original analysis, there were thousands of pages of government documents appended.

Though characterized as simply a “history,” a lot of the information in the Pentagon Papers was unknown to most Americans, and a good deal of it was at least embarrassing, if not subversive. The Pentagon Papers made it clear that multiple American presidents had been lying about U.S. involvement in Vietnam and that U.S. involvement there had started long before the 1960s. The report disclosed the extent of U.S. involvement in South Vietnamese politics. President Ngo Dinh Diem served from 1955–1963 and the report asserted that he would never have become president were it not for U.S. support. Diem was assassinated in 1963 as part of a coup, and the Pentagon Papers asserted that the U.S. was complicit. Perhaps the greatest revelation was that Vietnam was being used primarily as a way to “contain China.” Contrary to public statements by the administration, the Pentagon Papers secretly suggested that escalation of the war effort was

necessary if the United States was to have any hope for victory. Publicly, President Lyndon Johnson had emphatically stated that there would be no escalation and that it was not necessary.

Releasing the Pentagon Papers to the Public

In 1971, Daniel Ellsberg approached the *New York Times* to ask whether the paper might be willing to publicize the contents of the report. Ellsberg, a senior research associate at the Massachusetts Institute of Technology’s Center for International Studies, had worked for the RAND Corporation and served as an assistant to the Assistant Secretary of Defense, John McNaughton. As such, Ellsberg had access to the report and made an unauthorized copy, as he opposed the war and hoped that a disclosure might spur the United States to withdraw.

After multiple internal discussions at the *Times* over the legalities of publishing a stolen government document, the paper finally decided the importance of releasing the information outweighed the risk and began publishing excerpts in serial form on June 13, 1971. The next day, U.S. Attorney General John Mitchell asked the *Times* to voluntarily cease publication on the premise that national security was at stake. The *Times* declined, so the Nixon administration requested and was given an injunction from the federal district court in New York. Mitchell asserted that the *Times* was in violation Section 793 of the Espionage Act, which made it a crime to have unauthorized possession of information related to national defense that could harm the United States or advantage any of its enemies.

Frustrated that the *New York Times* had been forced to cease publication, Ellsberg turned to other publications, including the *Washington Post*, which began serial publication of the contents on June 18. U.S. Assistant Attorney General William Rehnquist immediately sought an injunction from the D.C. federal district court, but the request was rejected. An appeal to the U.S. Circuit Court of Appeals was also rejected. Within the course of 2 weeks, 20 different newspapers had published a portion of the report. With two federal circuits in disagreement over such an important matter, the case was ripe for Supreme Court review.

Prior Restraint Precedent

The Pentagon Papers case was not the first time the Supreme Court had to consider whether the government could prohibit publication, rather than subsequently punish speech. For free expression proponents, prior restraint is far more pernicious than subsequent punishment because of the impact on the marketplace of ideas. Ideas that never make it to the marketplace never get the chance to be evaluated, which is essential for the marketplace to properly function.

In 1931, the Supreme Court decided *Near v. Minnesota*. Jay Near was a publisher who ran afoul of a state law that prohibited newspapers from publishing “malicious, scandalous or defamatory” content. Near made anti-Semitic attacks on government officials and made allegations that they were involved in criminal activity. The state of Minnesota issued an injunction against Near under a state law regulating public nuisances. Near’s publication was likened to “houses of prostitution” and “noxious weeds.” Minnesota courts upheld his conviction, but by a 5–4 vote, the U.S. Supreme Court ruled that prior restraint was unconstitutional *in this case* but left the door open for prior restraint in areas including national security, obscenity, inciting violence, or overthrowing the government.

Supreme Court Case

The Supreme Court agreed to hear the Pentagon Papers case on June 26, 1971, less than 2 weeks after the first article appeared in the *Times*. Such immediate response is highly irregular for the Supreme Court. Even more unusual, it was only 4 days later, on June 30, 1971, that the Supreme Court rendered its verdict.

In *New York Times Co. v. United States*, the Court ruled 6–3 that the government had not met the “heavy presumption against” prior restraint. Despite the vote, the court issued a *per curiam* opinion, in which no justice is listed as having written the majority opinion, because there was no majority in agreement with the reasons for their votes. In fact, each justice in the case wrote his own opinion, which is not the norm.

The entire substance of the Court’s decision came in just two quotes, taken from earlier

Supreme Court rulings: “Any system of prior restraints of expression comes to this Court bearing a heavy presumption against its constitutional validity,” taken from a 1963 decision in *Bantam Books, Inc. v. Sullivan*, and, “The Government ‘thus carries a heavy burden of showing justification for the imposition of such a restraint’” from a 1971 ruling, *Organization for a Better Austin v. Keefe*.

The Pentagon Papers case is thought by many scholars to be the most significant prior restraint case ever heard by the Supreme Court. Although the case was decided in favor of the publications, it can hardly be interpreted as an unequivocal win for free expression. Saying that the government did not meet its heavy burden leaves the door open in the future for prior restraint to be deemed constitutional. In no way did the Court’s ruling discourage future suits.

Several First Amendment scholars point out the fact that the government was successful in temporarily restraining publication. If publication of the Pentagon Papers did, in fact, hasten the U.S. withdrawal from Vietnam, delaying that withdrawal by weeks or even days was a matter of life or death for soldiers who died in the final days of U.S. involvement.

Since 1971

In 1972 the *New York Times* was awarded the Pulitzer Prize for Public Service for publication of the Pentagon Papers, as well as for the paper’s legal battle to defend the right to publish. In 1973, Ellsberg and an accomplice, Anthony Russo, were tried for theft and dissemination of classified documents under the Espionage Act of 1917. The judge dismissed all the charges. Though parts of the report became public in 1971, it was not until 2011 that the entire *Report of the Office of the Secretary of Defense Vietnam Task Force* was officially declassified.

Many commentators have drawn parallels between Ellsberg and Edward Snowden, who released thousands of classified documents in 2013. Snowden himself has said he was inspired by a documentary on Ellsberg that he watched when debating whether to leak the National Security Agency documents, which Ellsberg has called the most significant leak in U.S. history. Snowden

had been working for a government contractor doing work for the National Security Agency and became frustrated at what he considered to be excessive privacy violations in the gathering of security data. Snowden attempted to raise his concerns but was frustrated that his supervisors ignored his complaints.

Snowden went to Hong Kong in May 2013 and released thousands of files to journalists in the United Kingdom and United States in June. The publicity that surrounded the release of the information cannot be overstated. Debate raged over the balance between personal privacy and national security. Previously thought only to gather data about suspects, the National Security Agency was revealed to have collected personal information about U.S. citizens who were not suspected of any crimes, which caused criticism of an agency that had operated virtually unrestrained since the attacks of September 11, 2001.

The U.S. government charged Snowden with two counts of violating the Espionage Act and revoked his passport. Snowden left Hong Kong for Russia, intended as an intermediate stop to another country. Four Western Hemisphere countries offered him asylum, but Snowden might have been arrested in transit, so he remained in Russia.

PHOTO AGENCIES

Photo agencies (a category of companies known by several different titles) provide photographs for commercial users including news media, both print and broadcast. Such companies usually make, collect or archive, and distribute photographs for a fee, either on a subscription or on a per photo basis, the price depending on the use of the image. Many photo agencies use their own photographers and distribute images shot by others (including smaller photo services and independent photographers). In recent years, declining media use and consolidation has changed the face of the business.

Origins

While magazines and newspapers long used their own staff photographers, what would become the professional news and photo service developed in the late 19th century and the early 20th century. The work of such famous Civil War photographers as Mathew Brady had appeared widely, though often without the photographer's knowledge, let alone permission. In 1895, photographer George Bain began his Bain News Service, one of the earliest firms aimed at the burgeoning print

media demand for pictures that had been created by development of the halftone printing process. Other companies soon followed. Underwood & Underwood was formed in 1901, and both Keystone View Company and Culver Pictures appeared about the same time. Later entries included United Newspictures (later Acme) and International News Photos (part of the news agency), both of which were set up in 1915. Wide World Photos followed in 1919, established by *The New York Times*, and the Associated Press began its AP Photos subsidiary in 1927 (it later would take over the Wide World operation, an early example of the consolidation to come).

Until the 1920s, photographs used in newspapers and magazines were either taken locally or had to be shipped, creating a real deadline problem beyond New York City and other major markets. The only distribution means were by messenger within the city, or by mail outside. There was no effective way for daily newspapers to publish timely photographs of events taking place beyond their immediate local market. It often took several days to a week to get photographs sent from one side of the country to the other. Technology changed that in the mid-1920s.

The wirephoto process—a variation of facsimile technology—was invented as “telephotography” by telephone carrier AT&T in 1924. The new process allowed photographs to be transmitted through the telephone network, anywhere in the country, though it required the use of an expensive and bulky wirephoto machine at both the source and receiving end. The original photograph was placed inside the sender’s machine and scanned line by line to translate the image into electrical impulses. These impulses were then sent by telephone line to the receiver where the impulses were translated back into a developed image on photographic paper.

AT&T offered its first commercial service in 1926 (though it would end in 1933 for lack of sufficient income to cover its costs). Early wirephoto machines were large, expensive, and all too often unreliable. The resulting wirephotos were usually of low definition (far less clarity than any original photo—they were often described as “muddy”) and could be further degraded by occasional problems with telephone line transmission. Further, sending one often took more than an hour, and the

sender had no idea if a recognizable image would be received at the other end. Thanks to this complex and pricy process, it took more than a decade for the process to be widely adopted.

AP began its wirephoto service in 1935 with links to 47 newspapers in 25 states. The first AP wirephoto showed an airplane crash in rural New York. United Press Telephoto appeared in the next year. The two news agency photo operations quickly dominated the business for newspapers as they focused on the latest news events. As the technology became easier to use, wirephotos became the dominant form of long-distance photo distribution for newspapers well into the mid-1970s.

By then, building on constantly improving photographic and printing technology, AP instituted its Laserphoto system. This sent images to subscribers far more quickly than the old wirephoto equipment and with much higher image resolution. AP updated this system in 1989 so that full color images could be transmitted in just seconds. These images were displayed on computer monitors and distributed in digital form. The result was newspaper and magazine pictures of much higher quality and the more common use of color photographs. Eventually, the news agency-owned photo operation would garner 30 Pulitzer Prizes for its news photographs. By the mid-2000s, they were distributing a thousand photos a day and had accumulated an archive of some 11 million images.

A Changing Business

Starting in the mid-1930s, and doubtless encouraged by the appearance of a growing number of photo-based weekly and monthly magazines as well as improving camera technology, a second wave of photo agencies began to appear. They combined current news photos with a growing photo archive of material, dubbed picture libraries, or (later) image banks. One of the first was Black Star, formed in 1935 by three refugees from Nazi Germany, one of whom brought some 5,000 photos from his Berlin photo agency. Black Star worked closely with the new *Life* magazine when it appeared starting in November 1936 and sometimes accounted for more than 40% of the weekly magazine’s images. Otto Bettmann (1903–1998) established his Bettmann Archive in 1936, which

soon stressed historical photos. And in 1938, Edward Hulton created the Hulton Picture Library. All of these firms—and the earlier photo agencies—were active on the battlefronts and the home fronts of World War II.

The Magnum agency first appeared in 1947 when photojournalists Robert Capa, Henri Cartier-Bresson, George Rodger, and David “Chim” Seymour formed it to distribute their photographs while protecting their image ownership rights. Initially based in Paris and New York and later adding offices in London and Tokyo, Magnum differed from other agencies in two ways. It was created as a cooperative venture in which the staff (which included co-founders Maria Eisner and Rita Vandivert) would support rather than direct the photographers. And copyright to their photos would be retained by the photographers, not by the magazines that published them.

Hubert Henrotte, Hughes Vassal, and Raymond Depardon established the Gamma agency in 1967, and the Sygma agency was created in 1973. But by now, the picture magazines on which so many agencies had long thrived were disappearing—*Life*, for example, had ceased its weekly publication the year before. As media clients dwindled, photo agencies were forced to broaden their business model to serve a wider variety of clients. Many branched out to serve commercial needs such as providing photos for use in company annual reports, brochures, or other business and industrial applications.

Consolidation

With the rise of the Internet came both a new way to market photos—placing masses of them online for easy perusal by potential customers (sort of a cyber-catalog)—and a continuing decline in traditional media photo markets. Photo agencies increasingly centered their marketing toward non-media business users. Web software could also be used to help seek out and fine those illegally placing copyright-protected photos on their own websites.

As with the companies they serve, major consolidation of photo agencies began in the 1980s, accelerating in the years to follow. For example,

Kraus purchased the Bettmann Archive in 1981. Three years later, Kraus took over the United Press International collection (which included the Acme and Pacific & Atlantic agency archives as well). Kraus, in turn was taken over by Corbis in 1995 (the agency formed in 1989 by Bill Gates of Microsoft). Corbis also purchased Sygma in mid-1999. The Getty Images archive was put up for sale at the end of 2007—and was expected to sell for something close to \$1.5 billion, an indicator of both the number of photos involved and the broad commercial value of these growing archives.

PHOTO EDITORS

Photo editors represent the visual elite, a select group of news professionals that make very important decisions concerning what is visually newsworthy. They are the professionals responsible for determining what images we see in the news because their creative and intuitive visual sense affords them the knowledge and expertise to tell a story visually. This visual sense encompasses photo editors' keen understanding of the aesthetic value of a photo balanced with the expression of ideas necessary to communicate vital information the public needs to know about. Good photo editors become who they are because they have visual sense balanced with an ethical responsibility concerning photojournalism. For that reason, photo editors are gatekeepers regarding what is visual news. They help frame the pictures in our heads.

In recent decades, a new media ecology has emerged that has shifted the way people consume media. The result is that digital media and emerging technologies have accelerated news delivery and transformed the production of news beyond traditional practices, and content is available for consumption through a variety of media outlets and platforms. Photo editors no longer solely consider photographic stories for print and also consider the power of storytelling through the Internet, social media, mobile devices, and other digital technologies. Yet, the photo editor's job continues to be their natural ability to sift through endless streams of images quickly and spot visual potential to tell a story for presentation in all media formats. Ultimately, photo editors are driven by the belief that photos serve as society's collective visual memory. For that reason, photo editors have a responsibility to make ethical choices on how best to communicate to the public about events, people, and places because photos serve as "visual proof" that something happened, a person existed, an achievement was earned, or a disaster occurred.

Creating Visual News

The study of the social construction of reality has long provided the lens to understand how people

interpret and make sense of society and culture and the conceptual backdrop for many seminal studies in news-making. Rooted in the social sciences, the social construction of visual news and thus the larger theoretical context of the social construction of news is reliant on individuals in their specific roles and responsibilities involving the establishing of norms, values, judgments, and so forth, that often function as central and rote choices regarding what is real, suggesting that the profession and its practice is, itself, a social construction with specific reference to constructing reality. As such, photo editors are integral to the social construction of news, especially visual news and what passes for the social construction of reality. This process is reliant on communicative events interpreted by various news professionals and reinforced with others in a social structure where shared meaning takes place through everyday routines and interaction with others. The process traditionally starts with a photographer's keen eye capturing a portion of reality guided by aesthetic conventions such as camera angle, depth of field, shutter speed, and subject matter. Photo editors then work with photographers or scan wire services to select the photos to best accompany the day's news. Photo editors also make decisions with assigning news editors, page designers, and news editors about the design and layout of pages as well as the presentation of photos that include photo placement, display issues, and so on, which together help a reader better understand a news story. These decisions, albeit subjective, become objective through the internalization of the social structure within the newsroom and thus contribute to the social construction of visual news.

Media Effects Research

A wealth of literature in mass communication (e.g., political communication, advertising, news, health communication, and environmental communication) has established that visual agenda setting, visual gatekeeping, visual framing, and visual priming do influence receivers of information as well as how audiences respond to and process news messages. Additionally, those in power or powerful positions (e.g., politicians, corporations, public relations, lobbyists) influence

public opinion and public policy through their access to news coverage, resulting in news content reflecting their goals. Moreover, research has examined positive and negative imagery as a messaging strategy, although results on the persuasive effect vary depending on the media content (e.g., advertising, health, advocacy, politics) and on image features such as sad, scary, happy, front-facing, size, or color versus black-and-white, to name a few. Evidence also supports that keywords (e.g., headlines, captions, hashtags) accompanied by visuals may function together to communicate information or express an implied meaning contradictory to the intended message. Taken together, these literature streams show how news professionals, including photo editors, present a viewpoint or prevailing ideology reinforced by corporations, politicians, and economic interests because they have control over the means of production on how content is organized, the style in which it is presented, and the focus or emphasis on particular characteristics of a story compared to others, and thus may influence public perceptions and opinions on the issues.

Agenda-setting research shows that the news media do not tell us what to think, but they do tell the public what to think about by establishing the importance of some topics more so than others and, consequently, transfer the salience of items on the news media's agenda to the public's agenda. Visual agenda setting further supports that visual elements function much like the text of a news story in establishing the news media's agenda. Whereas the news media sets an agenda by telling us what issues are important, photo editors make decisions about what news is visually newsworthy. This consists of making decisions on the number of photos to accompany a news story, size of photo(s), placement on the page, as well as if a photo should be displayed in color or black and white. While multiple gatekeepers have direct authority over the editorial functions of the news including story selection and assigning reporters to news stories, photo editors largely are the gatekeepers of visual news. Trained to understand ideas conveyed through images, they shape the decisions regarding what is visual news by assigning photojournalists to stories and ultimately photo selection. They decide to select one photo over another that best communicates the story

being told and filter out photos considered irrelevant to the news story, as well as select only those photos they think best represent the story at hand. Thus, by virtue of their position or education and photographic experience, photo editors exercise much power or influence over others. They decide what is visually newsworthy and thus are the gatekeepers of visual news.

While agenda-setting research found, as noted earlier, that the news media do not tell us what to think, framing literature supports that the news media influence the way we think about the news by transferring the salience of attributes to a prominent place in our minds. News professionals make conscious decisions that aid in socially constructing the news by actively applying framing to visual and verbal attributes of a news story. Photo editors use framing to present a particular viewpoint through the structure of content as well as employ stylistic and narrative features to influence individual perceptions and opinions about the issues. In this regard, they hold much power over how reality is shaped in the news by calling attention to information with contextual cues and attributes such as use of keywords, clever catchphrases, metaphors, concepts, visuals, and colors, as well as by following a particular design and format for organizing content. Framing also has the potential, however, to misrepresent or oversimplify the facts by emphasizing or excluding details and thereby disseminate misinformation about the issues.

Related to agenda setting and framing is priming, which repeats the use of contextual cues and attributes to frame a point of view and thus primes audiences' attitudes on a particular topic or related issues. For example, visible racial cues in political ads have been shown to heighten racial schemas and prime viewer attitudes on race. In another example, visual cues such as images of the rainforest, landscapes of mountains or glacial cascades, flora and fauna, or symbolic images of flowers and fruits as well as keywords such as fresh, clean, natural, green, and healthy primes readers that news stories are about nature or the outdoors.

The New Media Ecology

Through the wealth of digital media available, the news is accessible 24/7. As a result, how people

consume and exchange news has changed. Emerging technologies have created opportunities for amateur photographers to bear witness to events others might not see, and when given the opportunity, they too create strong visual stories that are equally important as those of professionals. However, technology also allows anyone with a mobile device or digital camera to capture or produce news of any kind instantly, fact or fiction. Yet even before digital technology, there were concerns that news professionals staged photographs or used darkroom manipulation to alter or enhance photos. In response to growing concerns that came about with the rise of digital photography, newsrooms addressed misconduct by implementing stringent ethical standards in which no manipulation was tolerated for hard news photos (e.g., factual, breaking news stories, and sports), though some retouching was allowed for soft news photos (e.g., human interest stories, arts and entertainment, leisure, travel).

In the past, constructing and executing the form and design of news content took great effort. Now, however, the broader impact of technology for everyone is that pockets of society use the Internet and social media to disseminate all sorts of news, real or fake, and on equal ground with industry professionals. The same virtual environment available to news professionals to produce the news also affords individuals with state-of-the-art tools and platforms that bring people together around divisive content, enabling the spread of fake news using highly charged imagery and powerful rhetoric that encourage acceptance of the content as truthful. Although the use of certain embellishments has become acceptable when it comes to the news, the burden is still on news professionals, including photo editors, to present news that remains accurate and informative. Thus, the basic premise of journalism still holds despite challenges brought about by this changing media ecology. And while technology may have transformed the production of news, the pressure is on photo editors to use their position as agents of news to make sense of the information and discern fact from fiction. This changing media ecology empowers photo editors with more choices both in presentation and distribution of content as well as how to engage and interact with the audience, and as a result, they are charting a

new path to storytelling that enriches society's understanding about a variety of newsworthy issues. Today, as in the past, photo editors look to photojournalism in some capacity to validate what is observed and communicate to the public what needs to be seen. They are tasked with making decisions that visually shape reality for us.

PHOTO MAGAZINES

Photo magazines are a type of illustrated periodical popular in media markets around the globe. While characterized by a substantial proportion of photographic illustration, photo magazines generally address issues of a broader, general appeal, emphasizing news and current events. Published weekly (or, less commonly, monthly), their journalistic functions were to (1) visually portray people and events, (2) summarize and contextualize developments beyond daily newspaper coverage, (3) entertain readers by presenting the new and unexpected, and (4) serve as a platform for photojournalists. Despite the fact that photo magazines have lost considerable impact in the age of television and the Internet, where visuals are omnipresent, for years they contributed substantially to the creation of collective memories.

Characteristics

Given that almost every title displayed at an average newsstand includes illustration, the mere fact that a periodical includes photographs is not sufficient to qualify it as a photo magazine. Photo magazines share the following characteristics: They appeal to general audiences rather than special interests; the news they contain covers many topics rather than focusing on particular fields; and they contain a mixture of information and entertainment that revolves around current events more than on business, professional issues, or entertainment.

This excludes several types of magazines—those on photography itself, most consumer

magazines lacking a “news” component, and the vast field of underground and lifestyle magazines that usually do not aim at a larger audience. But any suggested typology of periodicals falls short of providing clear-cut classifications in the face of an endless diversity of magazines available. The social and journalistic relevance of photo magazines peaked in the mid-20th century, with titles such as *Life* and *Look* in the United States; *Weekly Illustrated* and *Picture Post* in Britain; *Vu* and *Paris-Match* in France; and *Münchener Illustrierte* and *Berliner Illustrierte* in Germany.

From a global perspective, the American *Life* magazine, founded in 1936, encompasses most features associated with photo magazines. *Life* set out to tell a story in pictures or at least to provide pictures to explain what happens in the text. A “reader” needed only the ability and willingness to see, assess, and make sense not only of what was written but also of what was shown. The first prospectus for *Life*, titled *Dime* (after its intended price) and distributed in June 1936, highlighted the famous quote which became programmatic for the new magazine and can speak for photojournals in general:

To see life; to see the world; to eyewitness great events; to watch the faces of the poor and the gestures of the proud; to see strange things—machines, armies, multitudes, shadows in the jungle and on the moon; to see man’s work—his paintings, towers, and discoveries; to see things thousands of miles away, things hidden behind the walls and within rooms, things dangerous to come to; the women that men love and many children; to see and take pleasure in seeing; to see and be amazed; to see and be instructed. . . . Thus, to see, and to be shown, is now the will and new expectancy of half mankind. To see, and to show, is the mission now undertaken by a new kind of publication, The Show-Book of the World. (quoted in Smith)

Early criticism assumed an audience at the mercy of the persuasive power of the picture. Critics speculated that by relying too strongly on pictures, the danger of superficial information, fake statements, and readers’ misinformation might increase. Similar allegations continued in discussions about these magazines for years.

Yet despite their strong visual focus with photographs, photo magazines have always been more than mere storybooks. Their journalism could only succeed with texts indicating the content, the context, and often the meaning of what could be seen. Photo magazines also included longer sections with fiction, background reports based on elaborate texts, cartoons and other forms of visualization, and an extensive share of advertising (which in some cases was designed to simulate editorial content). Other sections included letters to the editor, fashion, or gossip. Special emphasis was placed on the cover that was on display at newsstands and served to give the publication added prestige. Like a window display promoting new items, the cover needed to arouse interest to convince the potential reader to buy the magazine: Considering the particular role of illustrations for photo magazines, readers expect outstanding visuals rather than bold headlines or lengthy previews.

Development

Although *Life* is sometimes called the first photo magazine, the tradition reaches further back in history. Until the end of the 19th century, illustrations in magazines could only be reproduced by using wood or other engraving techniques. This changed dramatically at the beginning of the 20th century as photography became increasingly available thanks to the halftone printing process and improved presses. The fascination of photographs that seemed to promise an unbiased view of reality boosted public interest in magazines, creating an audience growing more accustomed to visual impressions of world events.

The role of photo magazines in journalism grew dramatically between the two world wars. The power of the image on the page was undeniable, and many early American general-circulation magazines such as *Harper's Weekly*, *The Nation*, *Saturday Evening Post*, *Leslie's*, or *McClure's*, whose main focus was coverage of current events, added pictures to broaden their appeal.

The true photo magazine first appeared in Germany with the *Berliner Illustrierte Zeitung* (*Berlin Illustrated Times*, *BIZ*) and its many imitators. For the first time, a publication moved pictures to the center of editorial considerations. Kurt Korff,

editor-in chief from 1918 to 1933, argued, "the *BIZ* adopted the editorial principle that all events should be presented in pictures with an eye to the visual dramatic, excluding everything that is visually uninteresting." The *BIZ* expressed a sort of iconographic shift emphasizing "news to see" over "news to read." Famous press photographers such as Erich Salomon, Martin Munkacsy, Felix H. Man, Tim Gidal, Alfred Eisenstaedt, Otto Umbehr, André Kertész, Yva, or Sasha Stone produced photo essays consisting of five or more pictures that provided the dynamics of an event or issue and that would "tell the story" with a minimum of explanatory text.

An important prerequisite for the photo magazine lay in such new technical equipment as small portable cameras, interchangeable lenses, and roll film that replaced heavy and expensive plates. A new generation of photojournalists used these devices to develop a new style of reporting. Unusual perspectives and multiple exposures, or photomontage, were a few of the techniques employed to present pictures with the greatest impact. The development of photo agencies to distribute pictures made visuals globally available and emphasized the selection of appropriate photos as the most important newsroom routine in magazine journalism.

The large-size, rotary-printed, and newspaper-like illustrated photo magazines that were so popular in interwar Germany did not find an early equivalent in the American market, which lacked the battle for public opinion present in the streets of Weimar and demanded a fast and cheap medium. U.S. photo agencies continued to offer expressive or funny single pictures with short captions. But this situation changed dramatically when Time, Inc. launched *Life* in November 1936. The magazine's history reveals the vision of publisher Henry Luce had roots the "American Dream," and during the 1930s *Life* offered an idealized representation of everyday life in America. It is widely acknowledged that Luce took the *BIZ* as a model when creating *Life*—an assertion supported by the most important member of the editorial team—Kurt Korff, the former editor of *BIZ*. Though *Life* built upon an existing formula, it proved an instant success when the first issue sold out in 4 hours.

Several competitors soon tried to copy the success of *Life*, including *Ken* with its deeply

anti-Fascist editorial position; *Focus*, which adopted the muckraker approach; a “National Picture Monthly” called *Click*; or *Friday*, founded in 1940, which proved its anti-Fascist position with articles on anti-Semitism in America. Several other magazines predominantly relied on the photograph as the main carrier of their messages. *Peek*’s first cover in January 1938 showed a person peeping through a keyhole, reinforcing the promise of the magazine’s subtitle, “A Look at Life”; *Picture* traded under the name of “The Photographic Digest” supplementing its photo stories with numbers to suggest a sequence to the viewer. These and other titles exploited the increasing number of picture agencies, public relations outlets, and promotional photos available.

Another publication soon exerted a more formative influence due to its broad appeal. The biweekly *Look*, founded in 1937 by Gardner Cowles, was originally not seen as a “respectable” magazine and was categorized as “barbershop literature” by its critics. Along with its more serious companion publication *Life* (which did not exist when the plans for *Look* were drawn up based on Gallup audience research), it shared the idea of telling stories through pictures. In contrast to the explicitly political orientation of *Life*, *Look*’s editors, as stated in the first issue, “hunted for their unusual picture stories in the basic and important fields of screen, medicine, foreign lands, adventure, sports, inventions, crime, personalities, sociology, self-improvement, religion, beauty, movies, and the stage.” When the publisher’s wife Fleur Cowles, the later editor of *Flair* magazine, joined *Look* as an associate editor, the magazine transformed and gained a broader appeal to both men and women by emphasizing the female perspective on issues.

Life soon earned a great deal of prestige with its extensive war coverage, particularly with close-up shots taken under perilous conditions to obtain the most realistic portrayal of men in combat. Until the magazine ceased weekly publication in 1972, *Life* continued its coverage of armed conflicts in the postwar era as well as the nation’s political, social, and cultural changes in the 1950s and 1960s. With the end of *Life*, the “golden age” of photo magazines closed as the 1970s saw many similar magazines disappearing in different countries of the world. The motion of television had replaced the printed still image as a prime

conveyor of visuals for the collective memory. Although photo magazines are still available, their impact has declined even further with the emergence of online communication, which has opened up a seemingly endless and easily accessible universe of photographic documents.

Global Development

The success of photo magazines was a global phenomenon. The examples below will elaborate on four national trends regarding selected magazines in Germany, France, the United Kingdom, and the Soviet Union. Rather than being representative, the sample suggests particular approaches to the diversity of editorial concepts.

Germany

Among the early BIZ competitors, *Münchener Illustrierte Presse* (*Munich Illustrated Press*, MIP, 1924) led in modern magazine journalism. Its success was closely tied to Stefan Lorant, its editor, who considered the magazine a vehicle for his personal expressions and interests in the social and political environment. His appreciation of photography shows in the extraordinary salaries he paid his photographers. A third news magazine was the leftist *Arbeiter Illustrierte Zeitung* (*Worker’s Illustrated Times*, AIZ, 1925), now famous for its photomontages created by former Dada artist John Heartfield. A small staff around communist activist Willi Münzenberg aspired to publish a “true medium of the masses” using “worker photographs” as an instrument in the class struggle. For that purpose, the AIZ also employed photo essays, often covering the world of industry labor, which allowed German workers to have a glimpse into working conditions in other countries. One of the AIZ’s most celebrated achievements in the visual storytelling medium was when it dedicated two complete issues to the daily life and living conditions of one Russian family and one German family earning their living with factory and construction work.

During the 20th century, the German term *Magazin* (rather than its English counterpart) referred to a book-sized (approximately 7 by 9 inches), illustrated monthly periodical with up to 200 pages dedicated to entertainment and social

and cultural life. These publications ranged from the more sophisticated type of *Magazin* in the “feuilleton” style to the “spicy” type that attracted attention with its risqué and sometimes-explicit photographs. The *Magazin* era peaked in the late 1920s when almost every publisher offered one, and the interested reader could choose among 10 or more. All claimed to present interesting insight into arts, science, sport, and crime and were profusely illustrated with the growing number of photographs supplied by photo agencies in and around Berlin. Although “education through entertainment” remained one of the guiding principles of most *Magazin* publications, the sensationalist approach to content usually prevailed. With minor exceptions, the German *Magazin* was obsessed with the depiction of beautiful women. Most of the subjects were found among movie stars who served as projections for readers’ individual dreams and collective desires.

The American *Look*, distributed in Germany during the Allied occupation, laid the foundation for a magazine genre that was later called the *Illustrierten* (pictorials) in Germany. The term usually refers to the small group of general-circulation illustrated weekly photo magazines focusing on simplified news, glimpses into the private lives of film stars and royalty, and serial romantic novels. This orientation toward triviality (and, later, sexuality and nudism) was called the *4-S-Line* (*sex, sentiment, sensation, sadism*) by observers and made the “*Illustrierte*” a matter of public discussion, with critics and politicians accusing the publishers of stultifying their audience.

Between 1946 and 1948, the four most influential photo magazines of postwar Germany first appeared: *Neue Illustrierte* (*New Magazine*) in September 1946; *Revue* in November 1946; *Quick* in April 1948; and finally *Stern* (*Star*) in August 1948. They all claimed to cover current events, but throughout the 1950s, their content remained mostly apolitical and they may better be described as glamour magazines. Audience research suggested that during any given week in the 1950s, between 70 and 80% of adult Germans picked up at least one of these magazines.

France

In the late 1920s, photography became an important feature of the large-sized and lavishly

printed *L'Illustration* (*The Illustration*, 1843). A national flagship publication, the magazine produced occasional special issues of seasonal topics and important events (such as the Paris World Fair in 1938) while regular issues covered the universe of bourgeois interest in high culture. Reproductions were carried out with high diligence, thus making old issues of *L'Illustration* an aesthetic highlight in photojournalism.

The news magazine *Vu* (founded in 1928) developed a visual language unique in the 1930s while reminiscent of the *AIZ* style. Art director Alexander Liberman used photomontage to create some of the most memorable covers in magazine history. The first issue was launched with the editorial statement “In motion like a good movie.” Some of the photo reporters working for *Vu* in the early days were the most brilliant documentarists of their age—among others Man Ray, Brassai, Germaine Krull, and one of the cofounders of the legendary Magnum picture agency, Robert Capa, whose famous photograph of a dying soldier in the Spanish Civil War was first published in *Vu*. By mid-1940, when Germany occupied much of France, 633 issues of *Vu* had appeared. Although it was always devoted to current events, its significance lies in its editorial design. *Vu* was the first major photo journal with high circulation that adopted a modern layout as suggested by constructivist or surrealist approaches, the so-called new typography. Thus, it is one of the rare examples of an avant-garde photo journal successful in the mass market. Design was based on the dynamics of pictures, their emotional intensity generated for instance by close-ups or extreme perspectives, and sometimes even contradictory motifs.

Compared to other titles on the market, *Match*, which first appeared in 1938, looked rather conservative. Indeed French press magnate Jean Prouvost wanted nothing more than to replicate the success of *Life* by imitating the American model as closely as possible, from layout to content. In pre-war France, the magazine expanded its circulation from 80,000 to 1.4 million in less than 2 years. Its relaunch in 1949 as *Paris Match* followed the same pattern as the German and American markets, with print-runs peaking in the late 1950s followed by a sharp decline with the diffusion of television in France. *Match*, however, survived by adapting to the changing media landscape by focusing on in-depth articles instead of fresh news.

Moreover, stunning and artful color photographs replaced cheap-looking snapshots, one reason that *Match* remains one of the most important French news magazines.

United Kingdom

Despite its long-standing journalistic tradition, the British media market did not exert a substantial influence on the development of photo magazines. With the *London Illustrated News*, founded in the early 19th century, the major news magazine still maintained the tradition of engraved illustrations even in the early 20th century when photography became popular in other nations. Moreover, it had turned into a rather apolitical source following the general appeasement position of the British press toward Germany as suggested by the British government in the late 1930s. A major photojournal emerged in 1938 when former *MIP* editor Lorant, who had left Nazi Germany after being imprisoned under Adolf Hitler, became the driving force behind the British *Picture Post*. Publisher Edward Hulton supported this strong voice against Fascism in general and Nazi Germany in particular. Despite the initial hesitation of advertisers, Hulton sold the first edition of 250,000 copies within minutes.

Although Lorant never officially edited *Picture Post*, his influence on the photo magazine and hence on British photo journalism was substantial. His contract with the magazine was based on sales figures, so he benefited from the tremendous success of *Picture Post*, which had reached a circulation of 1.35 million copies after only 4 months. Before that, Lorant had designed *Lilliput* magazine (1937), a pocket-sized photo magazine that followed the model of the German “Magazin” in size and scope, and another publication that copied the *BIZ* model called *Weekly Illustrated*, published by Odhams Press in London in 1934. Records indicate that publisher Henry Luce and photographer Margaret Bourke-White took a complete set of this magazine as a specimen to New York when they began conceptualizing *Life*. Although Lorant may have arrived in the United States too late to exert an immediate and personal influence, his impact on the emergence of *Life*’s journalism through *Weekly Illustrated* and, later, the wide acknowledgment of *Picture Post*, is certainly evident.

Soviet Union

In the postrevolutionary Russia of the 1920s, the new government soon realized that magazines could play a key role in both teaching people to read and encouraging support of communism. The mechanical character of photography was associated with modernity, and its reproducibility suggested democracy. The nation’s first photojournal was called *Ogonyok* (*Little Flame*, 1923), and the relevance it gave to photographs of current events is demonstrated by the fact that its editor, Mikhail Koltsov, also edited the influential photo magazine *Sovetskoe Foto* (*Soviet Foto*, 1926). More importantly, Koltsov became part of the editorial board when the famous writer Maxim Gorky initiated *SSSR na strojke* (*USSR in Construction*), published between 1930 and 1941 in four different languages (Russian, English, German, and French; a Spanish edition was added later). It served as a prototype for photo magazines worldwide. Sponsored by the state, *SSSR na strojke* was intended both to charm communist leaders and gain friends for the Soviet Union abroad. The editorial statement in the first issue emphasized that photography should be the main editorial tool to depict the construction work going on in the USSR, because pictures conveyed more than even brilliant text. The table of contents, which named the photographers and the art director but not the text authors, underscored this approach.

From a contemporary perspective, *USSR in Construction* is notable for the participation of leading Soviet artists as freelancers for the production of particular issues, among them Alexander Rodchenko, Nicolai Troshin, and El Lissitzky, who in 1932 was the first designer to be credited on the masthead for artistic composition. The workflow differed substantially from other photojournals, since the editors did not use existing photographs from their archive or provided by picture agencies. Instead, an author created a scenario for the general topic, and the art director transformed this scenario into a sketch that included the nature of pictures he wanted to incorporate. In the case of Lissitzky, he personally advised the photographers how to take the pictures and how the montages should be arranged. Later, the photos were printed in toned rotogravure and often used a large page size (12 by 17 inches), leporello folds, and die-cuts to create

highly impressive visuals. The use of strong diagonal lines in layout to evoke movement, together with contrasting close-ups and long shots, created an overall impression that was cinematic in the tradition of the films of Russian filmmaker Sergei Eisenstein and the documentarist approach of French *Vu*. Interestingly, the launch of *USSR in Construction* was paralleled by a similar initiative by Henry Luce in the United States, *Fortune*, a monthly magazine focusing on the economy. Just like its Russian counterpart, *Fortune* highlighted the industrial culture of the nation and promoted business enterprises. In contrast to *USSR in Construction*, *Fortune* typography was conventional and was employed functionally and without superfluous decoration; only the cover served as a showcase for the avant-garde.

Photo Magazines in the Contemporary Marketplace

In the early 21st century, the traditional type of photo magazine that appeals to a general audience plays only a minor role in the media market. Indeed, the American photo magazines such as *Life* and *Look* survived the 1950s with a clear orientation toward the middle-class reader, promoting shared values and a “good life.” By 1970, however, six of the nine most prominent mass magazines had ceased publication.

Instead, the second half of the 20th century saw the rise of the special interest magazine that remains popular today, as proved by a brief glimpse at any newsstand. An attempt to revitalize *Life* as an editorial supplement of major newspapers in October 2004 was abandoned by March 2007, as the relaunch did not meet expectations in terms of advertising revenue.

The same trend appeared in Europe where the golden age of photojournals ended with the decreasing appreciation for photography amid the rise of television. Emergence of newer communication technologies such as the Internet made visuals of any form and kind ubiquitously and simultaneously available to both media professionals and the public. The industrialization of photo production and distribution leaves little room for the comprehensive photo magazine with mass appeal. Instead, globalization of media production has changed the field of special interest magazines as

well: International publishing houses produce content for outlets in different countries and sell advertising space to multinational enterprises. This is possible despite many differences in the cultural background of regions, as media consumers often display similar motives for media use. Their demands focus on a limited set of needs that can sometimes be met by content that has universal appeal, such as home-stories of Hollywood actors, reports of disasters, or war coverage. Thus, regionally tailored but universally produced special interest magazines have replaced the photo magazine as the latter lost its role as provider of collective memories to the moving images of the television age.

PHOTOGRAPHY

Photography is a media technology and form of communication. Since its inception nearly 200 years ago in 1826, photography has played a key role in shaping our awareness of history, creating national, social, and individual identities and effecting commonly held societal norms, ideological beliefs, commercial interests, and cultural values that are central to our way of life. This entry provides a general overview of photography in relationship to culture and society. In addition to examining the histories of analog and digital photography, this entry examines the picture press, documentary work, camera work, fine art photography, and street photography.

Defining Photography

Photography is a form of technology as well as a mode of communication which creates the illusion of reality through the control of the physical properties of light. A picture is created when light, directed through the lens of a camera or smartphone, strikes a receptive surface, be it film or a digital sensor, located at the back of the device. Sociologically and psychologically, photography conditions us to visualize and understand the world around us through the pictures we make and see—images that inform, persuade, entertain, or in other ways heighten the sense of what it means to be human. Today, however, photography no longer belongs to an elite group of skilled craftspeople, artisans, or scientists. In an age of automation and digital technology, photography is faster, easier, and far less expensive than any other time in history. It is often argued that anyone with a cell phone and a Facebook account can now be a photographer. In fact, the iPhone has become the

most popular camera used to post pictures on Flickr, a popular photo-sharing website.

Near the end of the 20th century, the shift from chemical-based analog processes to digitalization has disrupted the complex landscape of visual practices, routines, rituals, norms, and attitudes associated with photography. In 2017, for example, researchers estimated more than 1.3 trillion digital photographs were produced worldwide. Two decades earlier, however, only 80 billion pictures were taken. Each day, nearly 75% of all pictures taken are created using camera phones. Therefore, the shift toward making pictures with cellphones democratized how history is recorded. Studies indicate continuous growth in the smartphone market along with increased interest from the general public about how to make better pictures. In 2018, for example, the smartphone market was worth more than \$500 billion compared to the sale of digital cameras, which was \$18 billion in 2017.

As a form of visual and human expression, photography is not a monolithic enterprise that is limited to a single area such as in the fine arts, photojournalism, or the hard sciences such as medicine, forensics, or astronomy. Rather, photography inhabits our lives as a perceptual lens on the world—one which filters reality through technologies designed to satiate memory and our desire for and accounting of what we experience. Further, photography has, for most of its history, been one associated with the illusion of objectivity, which are validated in society by such adages as a “picture is worth a thousand words,” “the mirror of reality,” or “the camera never lies.” Any verisimilitude photography may have earned before the 1990s has been threatened by the ease in which pictures can be digitally manipulated today.

History

Photography derives from two Greek words *phōtos* and *graphé*, meaning to write with light or “light writing.” Although the term photography appears in writing as early as 1832, many scholars attribute Sir John Herschel (1792–1871), with popularizing the term in 1839.

After French inventor and lithographer Joseph Nicéphore Niépce (1765–1833) created the “first” photograph or sun picture using a custom-made

camera obscura in 1826, photography experienced a lengthy period of innovation and experimentation. The optical phenomenon of the camera obscura refers to a light-tight enclosure with a small opening or aperture on one side. Light rays pass through the opening and are reversed to form an image on the opposite side of the enclosure. The principle of the camera obscura, which means dark room in Italian, was well known to ancient Chinese philosophers as well as Aristotle (384–322 BCE), who wrote about the phenomena. For Nicéphore Niépce, however, his method of dipping a “well-polished” pewter plate in bitumen of Judea after an 8-hr exposure was not sustainable. However, the race for permanently fixing the effects of light onto film through chemical processes continued. Much like the trials experienced by scientists creating early digital images on video tape in 1960s, ownership of the earliest photographic processes cannot be attributed to a single inventor. For instance, in 1839, William Henry Fox Talbot (1800–1877) developed a method for permanently “fixing” a photographic image using hyposulfate as a fixing agent. But it was Louis-Jacques-Mandé Daguerre (1787–1851), a well-known painter and set designer, who refined Niépce’s original process in the late 1830s by inventing a new camera as well as a unique method for producing one-of-a-kind photograph he named the daguerreotype. Daguerre’s method produced an extremely clear photographic image made on a highly polished sheet of silver of copper, treated with iodine gas, and processed in mercury vapors. In January 1839, the inventor presented his camera, developing techniques, and a number of daguerreotypes to the French Academy of Sciences hoping to secure financial support for a practical and reliable method of producing photographs.

After the daguerreotype made its way to America, photography studios and “photo factories” opened in cities across the country. By the early 1840s, daguerreotypes had become popular with American politicians, celebrities, as well as the average citizen. For example, there were at least 130 known photographic portraits of Abraham Lincoln made between 1846 and his assassination in April 1865 using a variety of techniques including daguerreotypes, ambrotypes, ferrotypes, as well as collodion, albumen, and carte-de-visite

prints. Furthermore, in the decades following the invention of the daguerreotype, new innovations in lens quality, camera size, image processing methods, as well as the transition from single images to multiple copies from one negative guaranteed photography’s success as both a scientific and artistic medium. The daguerreotype, which marked a milestone in photographic history as portraits, became popular among politicians, celebrities, and the growing middle class soon gave way to other innovations. The new medium changed how people recorded life—picturing births, weddings, and funerals became commonplace. Photographs brought news of wars, exotic cultures on far-off continents, modernization, and industrialization.

During the Civil War, Mathew Brady (1822–1896), often referred to as the father of photojournalism, had a team of 20 photographers including, most notably, Timothy O’Sullivan (1840–1882) and Alexander Gardner (1821–1882), which provided the public with a firsthand glimpse of the horrors of war for the first time in American history. From floor to ceiling, Brady’s New York City gallery was filled with images showing the aftermath of conflicts at Gettysburg and Antietam as well as of pictures depicting various military regiments and units. Brady, however, was not the first war photographer. Historians credit the first combat photographs to those taken by an Austro-Hungarian photographer, Carol Szathmari (1812–1887) in 1853. A few years later, British photographer Roger Fenton (1819–1869) photographed the Crimean War in 1855. Nevertheless, Brady and his collaborators inspired generations of photojournalists. In the middle to late 19th century manufacturers of photographic equipment invented lighter cameras, a variety of new formats, faster and more sensitive films, better lenses, as well as safer and more standardized methods for developing film and photographic prints. From 1839 to 1852 changed as new styles, advances in technology, and the need for different types of pictures arose such as geographical survey work, photojournalism, criminology, and the fine arts.

For example, aesthetics borrowed from painting were often applied to photographic practice through a movement described as pictorialism, which manipulated and combined images to evoke emotions by focusing more on tone and

beauty rather than on accurately depict a scene. In some ways, pictorialism was a stylistic movement that can be compared with how images can be digitally altered on social media. Such aesthetic influences, however, only partially reflect photography's impact on society during the late 19th century. As photography became normalized as a form of representation, photographers no longer limited themselves to photographing landscapes, buildings, or events to merely inform the public. As photography grew in popularity and with major advances in technologies, people photographers began to explore new directions for the medium.

Camera Culture

By the 1860s, studios or picture factories capable of producing as many as a thousand portraits a day opened across the country. In 1879, the last known professionally made daguerreotype was made while advances in camera technology and processing techniques supported burgeoning amateur interests as well as the professional marketplace. Experimentation was central to many of the challenges facing photography early on. Using the newer wet-plate collodion process in 1877, Eadweard Muybridge (1830–1904) made history with his stop-motion photographs of people and animals. During his career, Muybridge, a pioneer in animal locomotion photography, produced more than 100,000 images. In 1878, Muybridge gained international acclaim by settling a bet for his patron, railroad tycoon Leland Stanford. With a dozen cameras spaced evenly on a horse track, Muybridge captured the gait of one of Stanford's horse in mid-stride to prove a theory that the animal's hooves come completely off the ground during a trot. Throughout the 1870s, a number of important new photographic innovations replaced slower, more complex and less stable techniques. For example, the invention of the gelatin process in 1873 by Richard Leach Maddox (1816–1902) freed photographers from having to develop images on location using dangerous chemicals and cumbersome equipment. Within just a few years, the traditional wet plate technique was replaced by gelatin emulsion process, which greatly increased the quality of the image, the speed or sensitivity of the plate, and allowed photographers to store

unexposed plates until they were needed. At the same time, along with processing techniques, the camera itself improved with the invention of a focusing bellows on the lens as well as the addition of a mechanical shutter. Ultimately, cameras were made smaller, more portable, and could be handheld. Furthermore, the stereographic camera, which rendered a scene in 3-D as well as use of flash powder for freezing action, was introduced.

By 1888, photography radically changed drastically with the introduction of George Eastman's reloadable camera using roll film. Considered one of the most significant advances in the history of photography, Eastman's Kodak #1 camera made photography affordable for millions of Americans. Eastman (1854–1952) was a former bank clerk who founded the Eastman Kodak Company with Henry Strong (1838–1919) on September 4, 1888. The company produced small handheld cameras that were preloaded with 100 exposures and shipped directly to the consumer for \$25. After finishing a roll of "snapshots," the customer returned the camera to the factory in New York, where the photographs were developed and shipped back with the ready-to-use reloaded camera. For more than 120 years, Kodak was a leading innovator in cameras and film. In 1977, while the company controlled nearly 90% of the film market in America, one of its engineers, Steve Sasson, invented first digital camera. Unfortunately, executives failed to realize the value of Sasson's invention as Kodak eventually declared bankruptcy in 2012.

The Picture Press

The publication of photographs in newspapers and magazines began in the 1840s but was not fully realized until a screening process, the halftone, was invented decades later. Illustrated magazines in Europe and later America such as the *Illustrated London News*, France's *L'Illustration*, and the *Illustrirte Zeitung* in Germany paved the way for American magazines, notably *Frank Leslie's Illustrated Newspaper* in 1855 and *Harper's Weekly* in 1857, respectively. However, reproducing photographs in print publications before the invention of the halftone was limited to artist woodcuts and wood engravings. In 1880, the first halftone photograph appeared in print.

The halftone photograph, originally invented by William Henry Fox Talbot in 1852, is a screening process, which converts a continuous tone photographs into an array of dots making reproduction possible. Photography's ability to capture the likeness of well-known personalities or depicting the news of the day brought the world closer to home through what became known as the picture press in America. At the same time, beyond photojournalism, other areas of photography emerged such as in immigration control, police forensics, dentistry, medicine, and advertising.

Technology has always play an important role in photography. From the 1830s through the early 1900s, making pictures was a slow, cumbersome, and highly technical process involving bulky large format cameras, long exposure times, and danger chemical agents in developing images. However, after the introduction of the Kodak #1 and other devices in the 1880s for simplifying photography, technologies improved dramatically.

In photojournalism, many news organizations adopted cameras such as the Graflex Speed Graphic. Introduced in 1912, the Graflex utilized a focal plane shutter, which could make pictures up to 1/1000th of a second, which was useful for covering sports and breaking news events. At the same time in Germany, Oskar Barnack (1879–1936) designed the portable Leica 35 mm camera, which led to the standardization of the 24-by-36 mm photographic format. Rangefinders and Single Lens Reflex cameras eventually replaced the larger format Speed Graflex in photojournalism because they were smaller, faster, and easier to use. Rangefinders such as the Leica measure in the focal distance between the subject and the film plane using a split screen. The single-lens reflex, however, allows the photographer to focus directly through a viewfinder using a series of mirrors placed over the shutter. Japanese manufactures, Nikon and Canon cameras introduced both types of cameras to the world beginning in the 1930s, which coincides with what is known as the Golden Age of photojournalism. This period primarily is associated with photojournalists such as Henri Cartier-Bresson (1908–2004), associated with the photography cooperative Magnum. In addition, Magnum, which was founded to represent the interests of photographers, was often underpaid in the publishing industry began in Paris in 1947 and includes Cartier-Bresson, Robert Capa (1913–1954), George Rodger (1908–1995), William Vandivert (1912–1989), and David “Chim” Seymour

(1911–1956). In photojournalism, Cartier-Bresson's idea of the “decisive moment” inspired photojournalists to consider how images should be composed based on the precise timing of the exposure as opposed to “setting up” or “staging” photographs. At the same time, photojournalists such as Alfred Eisenstaedt (1898–1995) and Margaret Bourke-White (1904–1971) were among the first photographers to be hired at *LIFE* magazine in 1936. More than 10 million high-quality photographs were printed in the magazine from 1936 until last year of publication in 2000. Furthermore, some of world's most important photographers such as Larry Burrows (1926–1971), W. Eugene Smith (1918–1978), and Annie Leibovitz (1949–) were featured in the magazine. Essentially, *LIFE* magazine and its competitor *Look* set the standard for photojournalism in America for more than five decades. After 2000, Time Inc. continued to use the Life brand for special issues. Life returned to scheduled issues as a newspaper supplement from 2004 to 2007. The website life.com was at the time managed as a joint venture with Getty Images, and on January 30, 2012, the URL began featuring photos channel on Time.com. The publisher, now the Meredith Corporation, has issued special editions on notable occasions, such as a Bob Dylan edition on his winning the Nobel Prize in Literature in 2016, and “Life” Explores: The Roaring '20s in 2020.

Doing Documentary Work

Throughout most of the 20th century, photography was perceived by the general public as a reliable and truthful representation of people, objects, and events, which sometimes affected social change in profound ways. For example, Jacob Riis (1849–1914), while working as a police reporter for the New York *Tribune*, documented life in New York City's ghettos. Riis's book *How the Other Half Lives* is a gritty exposé criticizing the treatment of the city's immigrant population living in squalid conditions. In addition, Lewis Hine (1874–1940) documented the plight of child laborers in the United States and advocated for reforms. As a sociologist, educator, and photographer, Hines documented children working under dangerous conditions across the Eastern United States. Between 1904 and 1917, Hines documented children working in textile mills and mines as part of a campaign by the National Child Labor Committee to promote child labor laws.

Hines's photography led, in a significant way, to legislation designed to protect the young from harmful working conditions.

This type of social and civic-minded photography differs from the fine arts, landscapes, portraiture, or even some forms of photojournalism pictures because it functions as a long form visual narrative, which is based on a singular theme over a period of time. For example, during the Great Depression of the 1930s, the Farm Security Administration hired photographers to document life in America as part of U.S. President Franklin Roosevelt's New Deal program. Under the direction of Roy Stryker (1893–1975), photographers such as Dorothea Lange (1895–1965), known for her iconic "Migrant Mother" photograph (1936), and Gordon Parks's (1912–2006) picture of the "Government Charwoman" (1942) contributed to the Farm Security Administration's efforts to improve living conditions for the poor, especially farmers, sharecroppers, and migrant workers. Other photographs made by Farm Security Administration photographers have become symbolic of life during the Great Depression such as Walker Evan's (1903–1975) "Roadside Stand" (1936), Arthur Rothstein's (1915–1985) "Dustbowl" (1936), and John Vashon's (1914–1975) color pictures of the working class, all of which helped to edify the general public's understanding of complex social issues.

Camera Works

While documentarians helped record reality in his or her own ways and photojournalist visual reported the news of the moment, others worked to redefine photography as a genuine art form in its own right. For example, Alfred Stieglitz (1864–1946), a successful art dealer, gallery owner, photographer, and publicist, founded the Photo-Secession group in 1902 to distinguish the field from what he considered to rampant amateurism early on in photography. Stieglitz introduced his quarterly publication, *Camera Works*, in 1901 to unify a new way of thinking about photography within the modern art world. Photographers such as Clarence H. White (1871–1925), Gertrude Kasabier (1852–1934), Edward Steichen (1879–1973), and Alvin Langdon Colvin (1882–1966) all contributed significantly to advancing the public awareness of the power of photography as an art. Over time, the Photo-Secession movement evolved

to include an emphasis on producing technically clean or "pure" photographs known as the *straight photography* movement. Embodied in the work of photographers such as Paul Strand (1890–1976), Edward Weston (1886–1958), and Ansel Adams (1902–1984), straight photography places a priority on precision and detail.

Fringe and Fine Art Photography

Around this same period, an antithesis of straight photography emerged and can be characterized by photographic montage, collage, solar prints, and angular shapes. During this time, surrealist photographers such as Man Ray (1890–1976) created images for many leading fashion magazines, which defied the prevailing aesthetic conventions of the picture press. Man Ray's work, however, is just one example of how innovations in photography emboldened others in the fine arts, portraiture, and fashion photography such as Diane Arbus (1923–1971), Richard Avedon (1923–2004), Irving Penn (1917–2009), Robert Mapplethorpe (1946–1989), Duane Michals (1932–), and Helmut Newton (1920–2004).

Street Photography

For most of his life, Eugène Atget (1857–1927) photographed the streets of Paris, particularly its architecture at the end of the 19th century. As a subset of photojournalism, street photography is an artistic genre typically practiced independently of formal sponsor such as a newspaper or having major financial organizational support. Essentially, street photographers are casual observers using cameras to make candid pictures of people as they go about their lives without his or her subject knowing it. Although they did not consider themselves street photographers, Alfred Stieglitz, mentioned earlier, and Berenice Abbott (1898–1991) for instance, began their careers photographing, street scenes, as well as urban landscapes. What defines street photography can often be a matter of opinion, but it often features the primary elements of mundane everyday life, such as people on the streets going about their own business in social settings. Furthermore, many street photographers who started out as photojournalists such as André Kertész (1894–1985) and Brassai (1899–1984) approached subjects with artistic as well as journalistic sensibilities. During the 1960s, Garry

Winogrand (1928–1984) epitomized the genre of street photography by capturing “slices of life” that might not be otherwise noticed by others.

Digital Photography

The history of the digital camera can be traced back to the development of video tape recording in the 1960s and later expanded upon for use in space exploration and government surveillance systems. It was the U.S. space program that utilized digital imagery early enhancing images transmitted back to Earth from unmanned probes. A decade later, Kodak, Canon, and RCA investigated the possibility of converting light into digital photographs, which culminated in Sasson’s invention of the first digital camera in the 1970s.

Photojournalism proved to be an early adopter of digital technologies since its methods were shown to be more efficient in terms of meeting newspaper deadlines. In 1979, *National Geographic* photographer Emory Kristof (1942–) was the first to use an electronic camera while photographing life at the bottom of the ocean in a miniature submarine. Kristof worked closely with television engineers at RCA to develop what is considered the first use of a charge coupled device in photojournalism.

Digital photographs do not capture light precisely the same way film does. The digital camera, unlike analog processes, converts the electromagnetic spectrum into binary code that is expressed as 0s and 1s. Photographs made with a digital camera are basically electronic snapshots scanning a scene onto a matrix of photoreceptor cells in the back of the device. A digital camera samples and maps what is seen as a grid of pixels or picture elements. Each pixel is assigned a tonal value (black, white, shades of gray, or color), which is represented in binary code (0s and 1s). The binary digits (“bits”) for each pixel are stored in a sequence by a computer and often reduced to a mathematical representation (compressed). The bits are then interpreted and read by the computer to produce an analog version for display or printing.

Concluding Thoughts

In the 21st century, most photographs and videos are made with cameras embedded in the cell phone

technology itself such as with the Samsung Galaxy or Apple’s iPhone. Camera phone technology is significantly different from the analog film camera, its progenitor. For instance, camera phones utilize semiconductor image sensors and telecommunication abilities that are maximized for data storage. The impact of the camera phone on traditional and stand-alone digital photography has been tremendous. For example, after more than 80 years, Olympus, which was an early pioneer in digital photography sold off its interests in June 2020 citing increased competition from smartphone manufacturers. In the 21st century, the market for standalone cameras has decreased by nearly 85%.

For nearly 200 years, photography influenced culture and society around the world. From the first black-and-white image made in 1826 by Joseph Nicéphore Niépce to the billions of selfies posted on social media today, photography is a technology that changes the way people communicate, establish identities, sell products as well as peddle ideologies. As a culture we tend to think of major events in terms of memorable and iconic images such as the picture made by Joseph Rosenthal (1911–2006) of U.S. marines raising the American flag on Iwo Jima during World War II or Nick Ut’s (1951–) picture of Vietnamese child running escaping the bombing of her village. When we think of the recent worldwide COVID-19 pandemic, our minds are full of pictures made by amateurs and professionals of people wearing masks or the dead being removed from hospital on gurneys. Scholars believe, photography has made us more aware of our common humanity and it will continue so, even as the devices and methods we use change with newer technologies.

PHOTOJOURNALISM, ETHICS OF

“Photojournalism” refers to visual reporting: deciding what to photograph and when, recording the images, choosing which photos to share with the world, and preparing those images for use. “Ethics” refers to what is morally *right* to do,

what humans *should* do. So “photojournalism ethics” refers to morally right conduct in visual reporting.

Determining what conduct is morally right in photojournalism—or any pursuit—involves reflection and analysis, which can be based on ideas from moral philosophy, ethical decision-making frameworks, or on the purest expressions of religious traditions, most of which emphasize honesty and benevolence. Principals of photojournalism ethics—as stated in news outlet and professional organization codes of ethics, as well as in photojournalism textbooks and scholarly volumes—generally encourage visual journalists to be truth-tellers who avoid harming others. Lapses of ethical conduct in photojournalism frequently involve manipulation of image content, depictions of violence or tragedy, and invasion of privacy.

Complicating the choices photojournalists and editors must make in these areas is the idea that “the camera never lies.” Because photography involves light bouncing off an object, entering the camera’s lens, and leaving a mark on a light-sensitive surface—with less human intervention than other types of image creation, such as painting—it often has been viewed as factual. By the late 1800s, photography had come to be seen as “a substitute for eye witnessing,” writes Queens University art history Professor Joan M. Schwartz. This notion extended “the authority of visual truth from the realm of actual experience to the verisimilitude of photographic realism” (Schwartz, 2000, p. 11). It was photography, for example, that established how horses gallop. In a series of photographs in 1878, Eadweard Muybridge demonstrated that horses are briefly airborne, with their legs bent toward the center of their bodies—showing that hundreds of years of paintings of horses splayed-leg in mid-gallop were inaccurate.

Almost from the beginning, however, photographs were manipulated, sometimes to overcome technical constraints. Nineteenth-century portrait photographers limited to black-and-white reproduction sometimes tinted images with paint to make them more life-like and attractive to customers. Landscape photographers sometimes combined the sky from one negative and the land from another to compensate for a limitation of 19th-century photo emulsions—the chemical coatings that react with light—that made them

more sensitive to blues and purples than other colors and tended to overexpose skies. In other cases, however, early photographers manipulated photos with the intent to deceive. During the 1860s, William H. Mumler of Boston made “spirit photographs”—including one for former First Lady Mary Todd Lincoln—that purported to show not only the subject of a portrait but also the spirit of a dead loved one. He was arrested in New York and tried on charges of fraud and larceny. Mumler was acquitted, however—largely, some historians have argued, because the defense produced as witnesses customers so eager to contact lost loved ones that they were pleased with their spirit photos.

Around this time, other photographers covering war were producing what are sometimes considered to be the first photojournalistic images. Although the resulting photographs often were hailed as important in bringing the reality of war to the public, some appear to have been staged. Some scholars believe Crimean War photographer Roger Fenton, for example, moved cannonballs in one photo from a ditch to the middle of a road, where their presence made for better composition. There is evidence that U.S. Civil War photographers such as Alexander Gardner and Mathew Brady, or their associates, posed or added figures for some images.

Photojournalism and Content Manipulation

Modern photojournalism ethics standards reject such manipulation, whether it comes before the image is produced or after, on the grounds that altering image content is a form of deceit. The code of ethics of the U.S.-based National Press Photographers Association warns photojournalists not to “intentionally contribute to, alter, or seek to alter or influence events.” Violations of such standards tend to draw widespread criticism. For example, the World Press Photo competition disqualified 2015 first-place award-winner Giovanni Troilo after it learned he had placed a remote-controlled flash for one of the images in a series, called *The Dark Heart of Europe*, about Charleroi, Belgium. The flash let him illuminate the interior of the car, where his cousin was having sex, and photograph it from a distance. Critics

said he had staged the photo; Troilo said his goal was “to show voyeurism through voyeurism.”

Substantially altering the content of an image *after* it is produced is also widely considered unethical. Most news organizations allow very limited changes, such as routine cropping to remove extraneous outer portions or making minor adjustments to color or grayscale that will let the image reproduce properly in print or online. Removing elements within a journalistic image, however, is generally forbidden, though it was possible even in an analog world. For example, John Paul Filo’s Pulitzer Prize–winning photo of teenager Mary Ann Vecchio kneeling by the body of Jeffrey Miller, one of four Kent State University students killed by national guardsmen in 1970, initially featured a pole behind Vecchio’s head. Sometime in the early 1970s, an unknown technician airbrushed out the pole, apparently to improve the composition, and the altered image appeared in several U.S. magazines in the 1970s and 1980s. Ironically, that manipulation appears to have escaped widespread notice until the mid-1990s, after the launch of Adobe Photoshop. Although earlier professional-grade image scanning systems led to some infamous cases of photo alteration—*National Geographic* moved the pyramids of Giza, Egypt, to fit its vertical cover in 1982 and the *St. Louis Post-Dispatch* removed a Diet Coke can from a photo of a Pulitzer Prize celebration in 1989—the availability of Photoshop produced numerous instances of manipulation that resulted in photojournalists being punished.

In 2003, the *Los Angeles Times* fired photographer Brian Walski, who was covering the U.S.-led invasion of Iraq, after his dramatic front-page image of a British soldier and Iraqi civilians was found to have been digitally created from two less perfect images. In 2006, Reuters ended its relationship with freelancer Adnan Hajj and changed photo selection procedures after bloggers raised questions about whether Hajj used Photoshop to add smoke to an image of Israeli airstrikes on Beirut, a charge he denied. The same year, the *Charlotte Observer* in North Carolina fired Patrick Schneider after he changed the color in the background of a photo to make it more dramatic—3 years after being suspended for altering an image entered in the North Carolina Press Photographers Association’s competition. In 2007, *Toledo*

(Ohio) *Blade* staff photographer Allan Detrich resigned as the newspaper began an investigation that found he had submitted 79 manipulated photos in a single 14-week period. In 2014, the Associated Press announced it would no longer work with Pulitzer Prize–winning photojournalist Narciso Contreras after he confessed that he had digitally edited out a video camera in an image of a fighter in Syria. Manipulation was such a concern that the World Press Photo competition disqualified 8% of its finalists’ images in 2014, 22% in 2015, and 16% in 2016 for violated rules on post-production alteration.

Manipulation standards can be confusing, however, because many newsrooms allow “photo illustrations,” which *The New York Times’s* Guidelines on Integrity, define as photographs “used to serve the same purposes as a commissioned drawing or painting—as an illustration of an idea or situation or as a demonstration of how a device works, etc.” News organizations that use photo illustrations often require a “photo illustration” credit line and keep such images out of breaking news sections, where they have sometimes caused confusion. In 1994, for example, *New York Newsday* combined images of Olympic figure skaters Nancy Kerrigan and Tonya Harding on its cover, giving some readers the impression that Harding, whose associates had clubbed Kerrigan at the U.S. Figure Skating Championships, was skating with her rival. Although editors placed the words “composite illustration” on the image, they were widely criticized. The same year, *Time* magazine faced charges of racism after it digitally darkened the face of ex-football star O. J. Simpson, who was facing murder charges, in a cover photo illustration.

Confusion can also stem from different photo-alteration standards in different cultures. U.S. publications that used an image by *El Pais* photographer Pablo Torres Guerrero of the aftermath of the 2004 Madrid train station bombing that killed 190 people generally cropped the image so that body parts weren’t in the frame. Several UK newspapers, both tabloid and more serious, digitally eliminated the body parts or drastically recolored them until they receded into the background.

Photojournalism and Images of Violence and Tragedy

While photomanipulation is often portrayed as a clear violation of photojournalism ethics, another frequently problematic area—visual coverage of violence and tragedy—offers more gray areas. Journalists are faced with a choice when they encounter images such as photojournalist Nilüfer Demir's 2015 photos of the lifeless body of 3-year-old Syrian refugee Aylan Kurdi or 17-year-old Darnella Frazier's 2020 citizen video of George Floyd, a Black Minneapolis man who died while his neck was pinned down for more than 8 minutes by police officer Derek Chauvin, who was subsequently convicted of Floyd's murder. Should they show the images so that society can be inspired to address injustice and act with compassion? Or should they withhold the images out of respect for the dignity of the victims or concern for the potential harm to families? Industry and professional group standards may not offer much help. Although the National Press Photographers Association code says that photojournalists should "give special consideration to vulnerable subjects and compassion to victims of crime or tragedy," a 2006 study of 47 U.S. media outlet and professional group ethics codes showed that although most discussed images—generally focusing on photomanipulation—only nine addressed images of violence and tragedy.

Three factors are worth consideration related to visual coverage of violence and tragedy. First, it can be useful to separate choices about *producing* images, which must be made quickly by photographers in the field, from choices about *using* them, which are made by editors with time to reflect. As witnesses to events, photojournalists should, in most cases, work to preserve images of violence or tragedy, though retired New Orleans *Times-Picayune* photographer Ted Jackson has written of moments after Hurricane Katrina in 2005 when he thought rescuing people was more important than taking pictures.

Second, how frequently a troubling image is used is often relevant. Is the photograph or video shown as part of initial news reports to inform the public? Is it being used later, during a trial or protest linked to the original event, to remind readers or viewers of the cause? Or is the image no longer

providing new information but merely filling the news media's near-insatiable need for images? Overusing an image of violence or tragedy can rob it of its power to shock or inspire action, writer Susan Sontag argued in *On Photography*. But repeatedly insensitively using an image of violence or tragedy can also have an opposite, traumatizing effect on victims, their family and friends, and others. Kathie Scobee Fulgham, daughter of Dick Scobee, the commander of the space shuttle *Challenger's* final mission, recalled that after the craft exploded on live television in 1986, she and her family, "couldn't turn on the television for weeks afterward, because we were afraid we would see the gruesome spectacle of the Challenger coming apart a mile up in the sky. My father died a hundred times a day on televisions all across the country" (Fulgham, n.d., para. 5). Political science professor Melanye Price made a related point in a *New York Times* op-ed about the 2020 George Floyd video. She argued that while videos of victims of police brutality can generate needed outrage, "Black death has long been treated as a spectacle" so it may not be ethical to "repeatedly show and share what are essentially snuff films with African-American protagonists." Scholars Renita Coleman and Thomas May write that journalists should show images of atrocities and use them more than once. But they should avoid reusing images of violence and tragedy to "the point of being used more as a logo than as information—a slide graphic over the anchor's shoulder, for example" (Coleman & May, 2004, p. 287).

Third, what is the context of the use of the image? Using an image of violence or tragedy in a way that strips personhood from an individual is ethically problematic. One way that sometimes happens is when Western media show images of victims of violence or tragedy from faraway locations, particularly the global South, without naming them or providing adequate context. An example is Kevin Carter's 1993 photograph of a starving child in Sudan being stalked by a vulture as she tried to crawl toward a feeding station. After the photograph was published in *The New York Times*, hundreds of people called the newspaper to ask whether the child survived. *Times* editors did not know; after Carter made the image, he said, he shooed the bird away and watched the girl resume her struggle, rather than

intervene. The photograph won a 1994 Pulitzer Prize, but a few months later, a troubled Carter committed suicide.

Similar concerns have arisen around images that show people the moment before they meet certain death. The *New York Post* was criticized, for example, in 2012 to devoting its front page to a photograph of Ki-Suck Han, a 58-year-old Queens man about to be fatally crushed by an oncoming subway train. The *Post* freelance photographer who captured the image, R. Umar Abbasi, said that he reacted in a split second, taking the image to set off his flash to alert the train's driver. *Times* journalist David Carr wrote that the *Post*, which, had time to reflect on the image, milked the death "for maximum commercial effect" and could have warned readers to watch themselves on subway platforms in more honorable ways.

Photojournalism and Privacy

Although U.S. state privacy laws generally hold that there is no *legal* expectation of privacy in public places, photojournalists and editors who use photography often must think about the *ethical* implications to subjects' privacy of making and publishing images. In 1964, for example, the *Daily Times Democrat* newspaper in Cullman, Alabama, published on the front page a photo of a woman whose skirt blew up as she was leaving a county fair fun house with her children, exposing her underwear. She sued and won an invasion-of-privacy lawsuit, *Daily Times Democrat v. Flora Bell Graham*, with the Supreme Court of Alabama ruling that she had not forfeited her "right to be protected from an indecent and vulgar intrusion" merely because misfortune overtook her in public. That lawsuit might have been avoided had journalists considered the ethics of publishing the photograph, which seems to have caused the woman significant embarrassment but offered little or no truth-telling value. Many celebrity photos made by the most aggressive of paparazzi might lack similar value.

In some instances, however, showing the private or intimate has contributed to truth telling, as in the case of the 1972 photo often called *Accidental Napalm Attack*. That image, made by Associated Press photographer Huynh Cong "Nick" Ut

near Trang Bang, Vietnam, showed Phan Thị Kim Phúc, then 9 years of age, screaming and running down a road naked, having torn off her clothing after napalm hit her back and arm. Rejected at first because of the nudity, the image went on to win a Pulitzer Prize and became a symbol of the atrocities of war inflicted on civilians.

PHOTOJOURNALISTS

From world capitals to small towns and in between, photojournalists since the beginnings of photography in the 19th century have visually provided information, inspiration, entertainment, and—above all—timely and meaningful news. In 1862, Alexander Gardner (1821–1882) photographed the dead horse of a Confederate colonel during the American Civil War. A century later, Gordon Parks (1912–2006) depicted, close up, the sweat-covered face of prizefighter Muhammad Ali. And in 1994, Mary Ellen Mark (1940–2015) photographed Ku Klux Klan members as, in darkness, they raised a wooden cross before burning it. Photojournalists, John Szarkowski of the Museum of Modern Art wrote, “give us the look and the smell of events that we did not witness” (1999, p. 142). The content of these images, historian Michael Carlebach has said, is “as varied as journalism itself” (1992, p. 2). From wars and disasters to breaking political news to photo stories about how people live their lives, photojournalists document the commonplace and the surprising.

Photojournalists once lugged bulky cameras that relied on glass negatives. Tripods steadied cameras that required long exposures. With equipment advances, photojournalists used steadily smaller cameras and better film. By the 1920s and 1930s—well before the advent of television and the Internet with a constant flow of pictures—newspapers and photo magazines demanded more photographs to accompany written stories as the public appetite for images grew. By the early 21st century, when visual images saturate the world, digital cameras allow for speedy transfer to websites and mobile apps where pictures—still or

moving, black and white or color—combine with sounds in slide shows about current events. Transformation in the delivery platforms of images continues to provoke tumult with the practices and the economics of photojournalism globally. Audiences rapidly shift in the ways that they consume and share the work of photojournalists. Regardless of the technology, century, or continent, however, the discerning eyes and minds of photojournalists around the world distill the essence of the news into visual forms, and the images work in concert with captions and stories.

This entry examines photojournalism’s development and definition, its overlap with other types of photography, and its status in a digital era. This entry also introduces several well-known photojournalists.

Development

In the late 18th- and early 19th centuries, inventors developed what would become the bones of modern-day photojournalism. Although not yet called by that name, photojournalism started as odd shots of destruction from fires and wars.

During the Mexican War in the mid-1840s, photographers made pictures that could be considered forerunners of photojournalism. A decade later, to counter negative newspaper coverage of the Crimean War along the Black Sea, photographers documented scenes in a favorable way for the British government. Distinctive among propagandists was Roger Fenton (1819–1869) of the Photographic Society of London. Focusing less on the ravages of war and more on well-attired British soldiers, Fenton made 360 glass-plate images. His most famous picture, titled “The Valley of the Shadow of Death,” showed cannonballs arrayed on the embattled Crimean earth (see Figure 1).

Half of a world away and in the next decade, a team headed by Mathew Brady (ca. 1823–1896) documented the U.S. Civil War. As with the best photojournalists, Brady and his photographers recognized the event’s significance. But their images could not be shown in newspapers or magazines because there was no way to convert the photographs into anything a printing press could manage. Instead, the photos inspired illustrations. For example, three separate Brady photographs were merged to form a *Harper’s Weekly*

Figure 1 Roger Fenton's famous photograph, "The Valley of the Shadow of Death," shot in 1855 during the Crimean War

illustration of Confederate bodies strewn across a field (Figure 2).

In that era of early photographic technology without artificial lighting, images required long exposures. By the 1880s in New York, social reformer Jacob Riis (1849–1914) benefited from a new invention—flash powder—that he used to illuminate the squalor of tenement houses packed with families, filth, and the choking smoke of coal stoves. Another reformer, sociologist Lewis Hine (1874–1940), later would help to establish photojournalistic documentation of societal problems.

A key breakthrough occurred in 1880 with the invention of the halftone method of converting photographic gradations of gray into dots or lines that a printing machine could stamp onto paper. Yet it took 40 years for photojournalism's full flowering. Innovative newspapers and pictorial magazines with higher quality paper and ink—such as *Berliner Illustrierte Zeitung*, *New York Daily Graphic*, *Picture Post*, *Paris Match*, and by the 1930s *Fortune* and *Life*—took advantage of photographs. This was especially true in Europe and the Soviet Union, where the visual movement known as *constructionism* emphasized unusual angles and juxtaposition. Pictorials in German newspapers and magazines flourished in the 1920s

Figure 2 Wood engraving published in the July 23, 1864, issue of *Harper's Weekly*. In the magazine's explanation underneath the image, the editors give a detailed explanation of the composition, explaining that it is based on two Mathew Brady photos—one of General Meade with his staff and one of General Burnside with his.

as lightweight cameras—the Ermanox and the Leica—came into use. Photographers such as Germany's Erich Salomon (1886–1944) took spontaneous, candid pictures with handheld cameras that used available light. In 1927, the Associated Press began a photo service to provide illustrations to newspapers and magazines.

During the depression of the 1930s, the U.S. government established the Farm Security Administration's photography unit to document the suffering. Although the agency's aim was propagandistic, photographers such as Marion Post Wolcott (1910–1990), Walker Evans (1903–1975), and Arthur Rothstein (1915–1985) established conventions of focusing on intimate human stories. For decades, photojournalists would further refine this approach.

Photojournalism

Indicative of the development of the practice, the term *photojournalism* came into use in the late 1930s. Alfred Eisenstaedt (1898–1995) in 1938 referred to *photojournalism*, saying that although it was new in the United States, it had taken hold in Europe. Henri Cartier-Bresson (1908–2004)

helped codify its concepts. He suggested, with a 1952 book of words and pictures, that photojournalists should capture “the decisive moment.” Magnum Photos photographers did their best to document action, not posed instances, without a flash. Cartier-Bresson had founded Magnum Photos photo agency with Robert Capa (1913–1954), David Seymour (1911–1956), George Rodger (1908–1995), and Bill Vandivert (1912–1989). Other photo agencies—Black Star, Sygma, Gamma, and the news agencies, United Press, and the Associated Press—provided photojournalists with steady work and supplied images for periodicals worldwide.

The 1940s marked the growing importance of photojournalists whose images of World War II filled magazines and newspapers. In 1943, the first Pulitzer Prize in the category of photography was awarded. Milton Brooks (1901–1956) of *The Detroit News* won for his picture of Ford autoworkers on strike as they attacked another worker crossing a picket line. (Notably, as the nuances of photojournalism changed so did the Pulitzer Prizes—by 1968, the single category had been divided in two: “breaking news” and “feature photography.”) In 1944, another major photojournalism contest began, now known as *Pictures of the Year International*. By 1945, a College Photographer of the Year contest started. In 1946, a number of newspaper and newsreel photographers from throughout the United States formed the National Press Photographers Association. They wanted to elevate their status as professionals making a critical contribution. In 1949, Clifton Edom (1907–1991), with former Farm Security Administration photo director Roy Stryker (1893–1975) and photographer Russell Lee (1903–1986), initiated the Missouri Photo Workshop whose goal was to “show truth with a camera.”

Volumes have been written about war photojournalists, especially those from World War II through Vietnam. Counted among the legends are Larry Burrows (1926–1971), Donald McCullin (1935–), Eddie Adams (1933–2004), and Catherine Leroy (1945–2006). To list their names evokes iconic images such as the execution

of a Vietcong soldier or a grimacing U.S. Marine crawling to rescue a wounded buddy.

Blurring of Lines

As curator of photography at New York’s Museum of Modern Art, Edward Steichen (1879–1973) in 1955 staged an exhibit called *The Family of Man*; its pictures revealed the blurring of boundaries across documentary, photojournalism, and fine art photography. In the 1950s and 1960s, photographers such as Robert Frank (1924–2019) and Diane Arbus (1923–1971) paid attention to people and places that photojournalists sometimes had ignored: roadside jukebox music joints, mental institutions, carnivals, living rooms, or backyards of ordinary folks. The ordinary became extraordinary with “new” journalism, reportage that considered everyday people as significant as the elite. Innovators such as Richard Avedon (1923–2004), Bruce Davidson (1933–), Danny Lyon (1942–), and Eugene Richards (1944–) offered new ways of photographing relationships between institutions and people affected by them. Under the “big tent” of photojournalism gathered social reformers, documentarians, “shooters” of news that was “hard,” “breaking,” or “spot,” and those who spent weeks, months, or years with their subjects. And a profession long dominated by men increasingly accepted women.

Photojournalists of the 1950s, 1960s, and 1970s documented social change throughout the world. This included the Civil Rights movement. Memorable images came from Charles Moore (1931–2010), who photographed Birmingham police dogs attacking a Civil Rights protester; Moneta Sleet Jr. (1926–1996), who won the Pulitzer Prize for Feature Photography for his photograph of Coretta Scott King at the funeral of her husband in 1968; Flip Schulke (1930–2008), who documented Martin Luther King Jr. leading the Selma to Montgomery march in 1965; and Bill Eppridge (1938–2013) whose “Kitchen Pieta” showed busboy Juan Romero trying to comfort Robert F. Kennedy after the presidential candidate had been shot in 1968. In the late 20th and early 21st centuries, *National Geographic* photographers such as Michael “Nick”

Nichols (1952–), David Doubilet (1946–), and Frans Lanting (1951–) drew attention to imperiled environmental conditions across the globe, including the loss of habitat for animals such as gorillas.

Digital visual advances of the 21st century heavily have influenced the practices of photojournalism that moves with lightning speed via the Internet. An iPhone video image of a white policeman killing an African American man George Floyd in Minneapolis, Minnesota, in 2020, helped to prompt protests globally, spurring a flood of related journalistic images. Photojournalists can circulate instantaneously their work that highlights not only everyday life but the extremes of life in the forms of war, poverty, immigration, and refugees fleeing perils. For *La Jornada*, a Matamoros, Mexico, newspaper, Julia Le Duc in 2019 photographed the drowned bodies of a Salvadoran father and his 23-month-old daughter along the Rio Grande after the current swept them away to death as they tried to migrate to the Texas border of the United States. That Associated Press image went out via Twitter, too: The toddler, with one arm around her father's neck, had her head tucked inside his shirt.

The list of notable photojournalists working globally is extensive. This includes Argentine photographer Walter Astrada (1974–) who uses his photographs to highlight violence against women across the globe. With his award-winning project *Undesired*, Astrada explores the impact of sex-selective abortion in India; in Guatemala, he examines femicide, and in the Democratic Republic of Congo, he documents rape as a weapon of war. Astrada traveled to Norway to investigate how women can be the targets of violence, even in one of the world's safest countries.

In Iran, Fatemeh Behboudi (1985–) is an Iranian documentary photographer and photojournalist. She worked for agencies such as Iranian Quran News Agency and Mehr News Agency before becoming a freelance photojournalist. In 2014, when she was only 28 years of age, Pictures of the Year International awarded her first place in the Feature Picture Story category for “Mothers of Patience.” This project, featured on *The New York Times* “Lens” blog, documented the

mothers of Iranian soldiers who went missing during the 1980–1988 war between Iraq and Iran. The photographs depicted these mothers, who dreamed that their sons would one day return home. Japanese photography curator Yumi Goto selected Behboudi for inclusion among 34 photographers worldwide featured by *Time* magazine in 2017, describing her as “one of the most important photographers.” In Bangladesh, Shahidul Alam (1955–) is representative of photojournalists fighting for human rights. In his case, he has been imprisoned and tortured for his visual activism critical of governmental repression. In 2003, he became the first person of color to chair the prestigious jury of the World Press Photo awards.

A Digital Visual Future for Now

For close to 175 years, photojournalists visually defined the answers to such questions as What is news? What and how could something be photographed? Emblematic of stretching the boundaries of this, Don Bartletti (1947–) of the *Los Angeles Times* rode dangerously atop freight trains to follow Latin American children escaping to *El Norte*, the United States. The youngsters wanted to rendezvous with their parents who had left them behind to seek a better life. Bartletti's images won a 2003 Pulitzer Prize “for his memorable portrayal.”

The essence of photography, Cartier-Bresson wrote, “is to hold one's breath when all faculties converge in the face of a fleeing reality . . . it is putting one's head, one's eye, and one's heart on the same axis” (1999, p. 16). Photojournalists have done this for years. Regardless of technological changes, they likely will do this for many years to come—recording and circulating the visual news.

Some Noteworthy Photojournalists

Names of photojournalists fill the annals of the Pulitzer Prize, Picture of the Year International, and other photography awards. Greatly truncating the field of journalists known as *shooters*, this short biographical listing includes a few of the

founding practitioners along with some contemporary innovators.

Margaret Bourke-White

Margaret Bourke-White (1904–1971) was born in New York City and introduced to photography at Columbia University. She graduated from Cornell in 1927 and worked as an industrial photographer in Cleveland. In 1929, she joined Henry Luce's new *Fortune* magazine. She later became one of *Life*'s first photographers, and her evocative image of the Fort Peck Dam on the Missouri River appeared in 1936 on the magazine's first cover. In 1937, with her husband Erskine Caldwell, she published *You Have Seen Their Faces*, documenting rural Southern sharecroppers. During World War II, she became the first woman accredited as a U.S. military photographer. In 1948, she photographed nonviolence advocate Mahatma Gandhi hours before his assassination in India. She worked with *Life* until the 1950s but was hindered by Parkinson's disease. The 1971 obituary of her in *The New York Times* quoted her as saying about photography: "Saturate yourself with your subject and the camera will all but take you by the hand."

Robert Capa

Born Endre Ern Friedmann, Capa (1913–1954) became famous during one war and died during another. His photographs of the Spanish Civil War and World War II were graphic and engaging. One image from Spain depicted a soldier at the moment of impact of the gunshot that killed him. In 1947, Capa helped to establish one of the most powerful photo agencies, Magnum, but his entry to professional photography was that of a trickster's ruse—he chose the name Robert Capa because it sounded like Hollywood director Frank Capra. His girlfriend Gerda Taro, herself a photographer, got him work by telling people he was a well-regarded photographer, though he was a Jewish Hungarian immigrant to France with little experience. There he found a home with other photographers, and with them established styles that were soon considered staples of photojournalism. He famously photographed Allied soldiers storming the beach at Normandy on D-Day on June 6,

1944, for *Life*. A decade later, while photographing the Indochina War, he stepped on a landmine and was killed.

Henri Cartier-Bresson

Cartier-Bresson (1908–2004) is considered by many as the "father of photojournalism." His love of photography had begun in adolescence with a Brownie camera. He harbored an early interest in painting and drawing and studied both at Cambridge. Eventually, he spent a year photographing in Africa where he contracted blackwater fever. The Gallery Julien Levy in New York in 1932 first displayed his work, and the same year the French magazine *Vu* published his photos. In 1940, the Germans imprisoned him as he had served in the French Army Film and Photo Unit. He escaped to photograph the German occupation of Paris in 1940 and later its 1944 liberation. In 1947, he joined four photographers to form the Magnum Photos photo agency. He disliked "arranged" or cropped photographs and favored candid photography. His notion of capturing "the decisive moment" remains at the core of photojournalism.

Chien-Chi Chang

Chien-Chi Chang (1961–) was born in a Taiwanese farming village. He has focused his career on ties that bind humans—literally and figuratively, from incarceration to marriage. In *The Chain*, Chang presents pairs of mentally ill inmates bound by chains. *I do I do I do* displays the elaborate marriage customs in Taiwan, while *Double Happiness* documents arranged marriages between Taiwanese men and Vietnamese women. Educated at Soochow University in Taiwan, he received a master's degree in education from Indiana University in 1990. He worked for the *Seattle Times* from 1991 to 1993 and for a year at *The Baltimore Sun* before he joined Magnum Photos in 1995. Chang's distinctiveness has earned him awards that include the National Press Photographers Association's 1998 Magazine Photographer of the Year.

Alfred Eisenstaedt

Alfred Eisenstaedt (1898–1995) was one of the first four *Life* magazine photographers employed

by publisher Henry Luce in 1936. Eisenstaedt's more than 80 covers for *Life* brought him international prominence. Though only 5 feet, 4 inches in height, he was a metaphorical giant among photojournalists. After working as a belt and button salesman, he started as a freelancer in post-World War I Germany. Possibly his most famous image was that of a kiss on V-J day in New York's Times Square. In the exhilaration of news that World War II was over, he followed a sailor in uniform kissing women of all ages and sizes. In one instant, the sailor embraced and kissed a nurse in a white uniform, her back swayed in an arch. Until the year he died, he photographed around the world. In 2000, the Digital Journalist website declared him "Photographer of the Century."

Arthur Fellig, "Weegee"

Weegee (1899–1968) and his direct flash lit up the noir of New York City nights—whether it was a homicide victim on the pavement or a starlet attending the theater. In 1938, he was the only licensed photographer in the city with a portable police band radio. His tenacious radio listening and his speed to crime scenes led to his being nicknamed after the Ouija board game. ("Weegee" was considered the phonetic spelling of "Ouija.") He seemed to have a preternatural ability to be wherever death, in all of its brutal forms, occurred. His lens not only captured violence but the paradoxical: One night he photographed two high society women awash in fur and glittery jewelry as they passed without notice by a ragged homeless woman staring at them. He titled the photo "The Critic." Weegee branched into fashion photography and film. He was such an icon that the movie *The Public Eye* portrayed him. Another film, *The Naked City*, referenced his photo book of the same name. He left a legacy of the archetypal, charismatic, city-toughened photojournalist.

Donna Ferrato

Donna Ferrato (1949–) studied sociology and photography at the San Francisco Art Institute and then she began her career hoping to capture images of love. But she witnessed domestic violence at a photoshoot and then focused on the men, women, and children affected by physical

and emotional abuse in families. In one of her well-known photographs, a young boy points a blaming finger at his father as police search and arrest the man. Ferrato's work led her to activism, and in 1985 she was given a W. Eugene Smith Foundation grant. After photographing for a 10-year period, in 1991, she produced *Living With the Enemy*. That same year she received a Robert F. Kennedy Award for a *Philadelphia Inquirer* story. Shifting her attention, she published *Amore* and *Love and Lust*, books that tell love stories in Italy and the United States. Her clients have included *Time*, *People*, and *The New York Times Magazine*.

Carol Guzy

Born in Bethlehem, Pennsylvania, Carol Guzy (1956–) studied nursing at North Hampton County Community College. She discovered her love of photography when she attended the Art Institute of Ft. Lauderdale, Florida. After working at the *Miami Herald* from 1980 to 1988, she moved to *The Washington Post*. Guzy has won four photography Pulitzer Prizes: the first for coverage of mudslides in Colombia; second, for images from the U.S. military intervention in Haiti; third, for work in Kosovo; and fourth, for earthquake pictures from Haiti. Guzy has received eight White House Press Photographers Association's Photographer of the Year honors, three National Press Photographers Association Photographer of the Year awards, and the Leica Medal of Excellence.

Josef Koudelka

Born in Moravia, Josef Koudelka (1938–) worked as an aeronautical engineer before he became a professional photographer in the 1960s. As a freelancer, he captured theater life throughout Europe. In Prague, in 1968, he photographed the Soviet invasion of Czechoslovakia. Fearing retribution, Koudelka submitted his photographs as "Prague Photographer" or "P.P.," not revealing his identity. As an anonymous photographer, he was awarded the Overseas Press Club's Robert Capa Gold Medal. In 1984, he disclosed that he was "P.P." In exile, he had left Czechoslovakia in 1970 and moved to England, where he lived for a decade. In 1971, he joined Magnum Photos. His

book *Gypsies* was published in 1975 and *Exiles* appeared in 1988. His photographs have appeared in such magazines as *Camera* and *Look*.

Dorothea Lange

Dorothea Lange (1895–1965) was stricken with polio at age seven, resulting in a lifelong limp and, according to her, empathy for those who suffer. In a career that helped to form the essence of documentary photography, she demonstrated how sensitivity is revealed visually. As a college student in New York, she visited portrait photographer Arnold Genthe who nurtured her interests by giving her a camera. Eventually, she headed to San Francisco to open her own studio. After collaborating on a project with economist Paul Taylor, she married him. As a photographer with the Farm Security Administration during the 1930s, she created two of her most famous examples of documentary journalism from the Great Depression. In “White Angel Bread Line,” she depicted hungry men waiting in line for bread. In perhaps the most defining picture of that era, she photographed an exhausted migrant mother with her two children. She won a Guggenheim Fellowship in 1941 and soon after that photographed Japanese Americans in World War II internment camps. She worked for *Life* in the mid-1950s, by which time she had become recognized as a foremost photographer whose work was exhibited in art museums as well as published in newspapers and magazines.

Peter Magubane

Peter Magubane (1932–) spent much of his career covering apartheid violence in South Africa. He was born near Johannesburg and became interested in photography as a child. In 1955, he began photography assignments with *Drum* magazine, a political forum for Black people across Africa. He was arrested for the first time in 1956 for photographing protests against government policies of racial segregation. He continued to capture the violence on film for three decades. Magubane was beaten, jailed, and once banned from using his camera for 5 years. His photographs helped put the international spotlight on the bloodshed of

two key incidents: the Sharpeville Massacre in 1960 and the Soweto Uprising of 1976.

Susan Meiselas

Born in Baltimore, MD, Susan Meiselas (1948–) earned degrees from Sarah Lawrence College in 1970 and Harvard in 1971. She taught photography in cooperation with the South Carolina and Mississippi Arts Commissions. Her book *Carnival Strippers*, published in 1976, documented New England traveling shows. That same year, Meiselas joined Magnum Photos. Her photography has illuminated life in Central America, including the Nicaraguan revolution of the 1970s. She spent more than a decade covering El Salvador and was coeditor of *El Salvador: Work of Thirty Photographers*. In 1992, she was awarded the prestigious MacArthur Fellowship.

James Nachtwey

James Nachtwey (1948–) has captured images of famine in Somalia, AIDS in Africa, and wars throughout the world, including Bosnia, Afghanistan, and Rwanda. Nachtwey uses the camera as a translator to bring viewers into the world he photographs. Born in Massachusetts, Nachtwey studied art history and political science at Dartmouth and graduated in 1970. He was a member of Magnum Photos from 1986 to 2001. After that, he helped to found VII Photo Agency. He has worked with *Time* since 1984. He has won the prestigious Magazine Photographer of the Year seven times. Of his work, he has said his photographs testify about things that “should not be forgotten and must not be repeated.”

Gordon Parks

Parks (1912–2006) extended the field of documentary photography with topics ranging from poverty to women’s fashion. Born in Fort Scott, Kansas, as Gordon Roger Alexander Buchanan Parks, he was the youngest of 15 children and held a variety of jobs, including busboy and semi-pro basketball player, before becoming a photographer. He bought his first camera after seeing the work of the Farm Security Administration’s photography project, which he joined in 1942. That

year he took perhaps his most famous photo, “American Gothic,” of Ella Watson, a Black cleaning woman in Washington, D.C., in front of an American flag. He became *Life*’s first African American photographer in 1949. In addition to photojournalism, Parks gained fame as a writer, composer, and filmmaker.

Sebastiao Salgado

Sebastiao Salgado (1944–) records undetected or underdetected stories on an international scale. Born in Aimorés, Brazil, he earned an economics master’s degree from the University of São Paulo. After completing a PhD in economics at the University of Paris in 1971, he worked for 2 years for the International Coffee Organization. In his first large project, he documented starvation in Africa for the World Council of Churches in 1973. He then became a freelance photographer with Sygma in 1974 and the Gamma Agency, 1975 to 1979. His 1986 photograph of workers in the Serra Pelada Goldmine in Brazil won acclaim as he pictured a worker resembling someone on a crucifix. Salgado was a member of Magnum Photos for 15 years until 1994 when he launched his own agency, Amazonas Images.

W. Eugene Smith

W. Eugene Smith (1918–1978) created the language of the photojournalistic essay. With stories such as ones about a country doctor and a Mexican village, Smith taught photojournalists ways to use still images to construct powerful narratives with precise visual syntax. His legacy continues through the W. Eugene Smith Fund to promote “humanistic photography.” Smith fought with editors and publishers over image control. His sensitivity allowed him to craft potent pictures, such as his “Tomoko Uemura in Her Bath.” Depicting the effects of mercury poisoning from industrial pollution in Japan, the image was published in *Life* magazine in 1972. It shows a mother bathing her deformed daughter and is considered one of the most significant examples of 20th-century photojournalism.

Huynh Cong (Nick) Ut

Huynh Cong (Nick) Ut (1951–) started photographing the Vietnam War in his native country

at age 15. Ut had become a photographer by developing Associated Press (AP) negatives and teaching himself to take pictures. He earned fame for his Pulitzer Prize–winning photograph “The Terror of War,” which showed a young girl running down a road after being burned by napalm. After photographing the fall of Saigon in 1975, Ut left Vietnam. He worked in Tokyo for Associated Press and then went to Los Angeles, where he was a senior AP photographer until he retired in 2017.

PLAGIARISM

Plagiarism is often described as one of the most serious ethical violations in journalism. It is so widely presumed to be self-evidently wrong that most ethics codes and textbooks, if they address the subject at all, dispatch it in a terse, finger-wagging prohibition such as “never plagiarize.” A study of 10 years of journalistic plagiarism showed that 57% of offenders lost their jobs through resignation or dismissal. Although universally condemned, plagiarism is not uniformly defined or understood. Journalists debate whether visuals and ideas can be plagiarized while concurring that words can be. However, there is no standard for how many words, consecutively or cumulatively, constitute plagiarism. Neither is there agreement over severity. Some ambiguity is due to situational factors, as some subjects allow for distinctive phrases while others are more formulaic, with little room for originality. Some types of communication, such as parody or memes, require imitation. Also, social media are rapid dissemination tools that recirculate material too fast for attribution to keep pace. Therefore, plagiarism cannot be defined in absolute terms but must be considered contextually. This entry further discusses the definition of plagiarism, issues with defining plagiarism and explaining why it matters in journalism, and how ideas about plagiarism among U.S. journalists developed along with the country’s news industry.

Definition

Plagiarism can be defined in just five words: reusing original material without attribution. Embedded in that concise description, however, are a number of contentious issues that are not mere disagreements or matters of opinion. Rather, these are substantial if often unarticulated matters that, whenever a significant incident of journalistic plagiarism surfaces, contribute to an undertow of uncertainty over exactly what plagiarism is and why it matters.

Implicit in the first word of the definition, reusing, is the commonly held belief that plagiarism involves passing off someone else’s work as one’s own, a requirement found in many descriptions of plagiarism, and not just in journalism. This approach has two benefits. First, it guards against applying the definition to instances in which a forgotten memory resurfaces in a way that the author mistakenly believes is original, or what psychologists call cryptomnesia. Second, it tacitly makes originality the default, which counteracts the derivative nature of journalism. That said, the passing-off requirement is troublesome. Most plagiarism involves a desire not to claim someone else’s work but to minimize its origins.

Plagiarism commonly occurs when a journalist seeks to “match” a story produced by another news organization. The journalism organization may desire to downplay or hide the origin to avoid acknowledging that the story is not original, especially if the originator is a competitor. Hiding origins is why broadcasters commonly reduce attribution to one purposefully ambiguous word, “reportedly.” Even some prestigious digital news organizations tend to be frugal with hyperlinks and infrequently use a phrase like “as first reported by.” Such practices result from a desire not to claim ownership of another’s material but to avoid calling attention to it.

The passing-off requirement is also problematic because it creates a loophole for perceived intent. Often an individual accused of plagiarism will employ a defense of “I did not mean to,” as in, “I did not mean to take that material and claim it as my own.” Such a defense is frequently true. It may be that attribution was honestly overlooked in the writing or editing process or, as noted, the actual desire was to conceal origins. However, intent is definitionally irrelevant. If expected attribution is omitted, perceiving whether the cause is due to forethought or negligence does not determine whether plagiarism has occurred. Intent may factor into sanction decisions, but its use as a definitional element can confine plagiarism to only the most unforgivable manifestations.

Advocates of passing-off as a definitional requirement are not without justification, for intent is suggested by the word’s etymology. “Plagiarism” is derived from the Latin word for “kidnapping” and thus carries connotations of literary theft. In turn, theft implies intent to take someone

else's possession. However, theft as a metaphor does not align with journalistic plagiarism. Theft involves depriving a person of a possession, such as a car or a book. When material is plagiarized, the publisher has not lost custody of the intellectual property. Duplication may result in the original publisher losing a detectable if small monetary value if the copyist diverts readers or viewers that might otherwise have looked at the original version and thus appropriates some measure of online advertising revenue. But what has been taken is a portion of the revenue that might have been associated with the material, not possession of the material itself. Instead of theft, a more accurate metaphor for plagiarism is counterfeiting, the making of an unauthorized copy.

The second word of the definition, original, is challenging for journalism. Malcolm Gladwell, a former *Washington Post* reporter who became a best-selling author, has noted that journalism is reluctant to acknowledge that it is inherently derivative, dependent on the work of others. National news organizations rely on local ones as uncredited tip services just as perennially short-staffed broadcasters rely on other local news organizations for story ideas and sources. Generally, journalists believe that material derived exclusively should be credited while less singular sources are exempt. Thus, if a president says something new in a one-on-one interview with a reporter, it should be attributed to that news organization while no credit is required if the statement is spoken in a more open setting. However, an exclusively obtained fact can become common knowledge quickly through repetition on social media or broadcast, and expectations of attribution can fade in minutes.

Equally vexing is the third word, material. Plagiarism usually involves words, although no discipline has quantified the number of repeated words or sentences required. In principle, plagiarism could be just a single word, such as a distinctive catchphrase like "boohyah" used by the late ESPN broadcaster Stuart Scott, although in practice plagiarism conventionally requires at least a substantial portion of a paragraph. Idea plagiarism is rare, but only because few acknowledge it. A national survey showed that three-fourths of U.S. journalists approve reusing someone else's idea and retracing the same steps so long as fresh interviews are done. A rare

example of idea plagiarism being met with disapproval involved a news photographer who was fired for creating a studio image of candy that an editor thought too closely resembled someone else's photo. No known cases have surfaced that involve other visual arts, such as video, graphic design, or charts. Instead, almost all plagiarism accusations involve words.

The last two words in the definition, without attribution, create disagreement because journalists rarely delineate when material should be attributed. For example, some local news organizations routinely claim ownership of Associated Press (AP) material after changing a few words, without attributing the wire service. Sports reporters sometimes rely on "quote packages" compiled by team publicists without acknowledging to audiences they did not hear the words spoken. An internal investigation into plagiarism accusations against *Detroit Free Press* sports columnist and best-selling author Mitch Albom in 2005 found sports writers routinely treated quotations published by any news organization as free for reuse, without crediting the original source. News organizations customarily print opinion pieces by public figures they know were actually written by a publicist without divulging the true origin to audiences. Some local television stations use portions of videotape segments prepared by public relations agencies without signaling the source. Journalists are unsure how to attribute material reused from their own publications. In general, journalism minimizes attribution.

Consequences

Journalists differ on whether plagiarism requires malicious intent, which materials require attribution, and even precisely why plagiarism is wrong. Because journalists struggle to define plagiarism, they sometimes allow the chosen sanction to determine whether plagiarism has occurred. One study showed that journalists were statistically more likely to use the word "plagiarism" to describe a journalist's actions if that journalist was sanctioned or left the job. In instances in which the offending journalist stayed employed, news organizations tended to employ euphemisms such as "closely reflected the phrasing" or "inappropriately duplicated wording" without calling it plagiarism. Such definitional malleability betrays the

bind borne by journalists who assert plagiarism is among the most serious of ethical offenses. If plagiarism is presumed in principle to be that serious, but a specific offense is deemed to be too inconsequential to warrant sanctions, journalists reclassify the copying as something other than plagiarism to maintain consistency.

The correlation between definition and sanction attests to a fundamental issue: Journalists are habitually unclear about why plagiarism is so wrong. Euphemisms regarding duplication stem from the unarticulated presumption that plagiarism is a failure to adequately paraphrase. The belief that paraphrasing is the sovereign remedy for plagiarism allows journalism to hide its derivative nature, and reusing material is tacitly allowed so long as it does not mirror the original too obviously. Such a belief implies that plagiarism is wrong because the material was insufficiently reworded. Other reasons editors offer for why plagiarism is wrong include that it is a “breach of trust” with readers and viewers or that it is a violation of accuracy standards, although if the original material was vetted for accuracy, copying would not render it inaccurate. Such confusion occurs because journalists frequently lump together plagiarism with fabrication, even though they are very different.

The lack of journalistic clarity about plagiarism notably surfaced in a 2019 case involving former *New York Times* editor Jill Abramson in her book, *Merchants of Truth*. A Vice News reporter, Michael C. Moynihan, used Twitter on February 6, 2019, to call attention to numerous factual errors and plagiarism. The accusations drew wide attention, including television appearances and a *New York Times* story. Abramson expressed dismay at the omitted attribution and promised to correct it, though she took umbrage at the accusation that she had tried to hide sourcing when the book offered a 70-page notes section. Beyond the ironies involving the author’s lofty status and the book title, the attention given the Abramson ordeal let slip journalism’s complicated relationship with plagiarism. As the book title suggests, truth is journalism’s ultimate obligation. Yet it was not the assertions of inaccuracies that drew attention to the Abramson case but the allegations of plagiarism. Even in reporting on the episode, *The New York Times* on February 7, 2019, focused on

plagiarism in its headline and first paragraph and did not mention factual issues until the 10th paragraph.

Plagiarism is wrong, but whether it is among the most egregious of journalistic offenses is less clear. No one argues that plagiarism is acceptable. By omitting attribution, journalists deprive audiences of some of the information they need to evaluate what they are hearing or reading. In the same way that audiences should be told whether quoted statements were derived from spontaneous oral interviews or cautiously written emails, they deserve to know the sources of information journalists deliver. On the other hand, it is difficult to argue that plagiarism is more serious than substantial inaccuracies.

History

The outsized importance ascribed to plagiarism, as well as the unspoken belief among many journalists that it is a crime against peers, draws in part from its historical association with the evolution of authorship. Early American newspapers liberally copied from European periodicals and from one another, although often crediting their sources. Plagiarism did not become an issue until the mid-1800s, after newspapers became major commercial ventures that fought for scoops and promoted the value of their individual writers to differentiate themselves from competitors, at a time when all sizable U.S. cities had multiple newspapers. As appearance of originality created market value, newspapers had a financial incentive to minimize attribution, camouflage copying through paraphrasing, and steal if necessary. Pinching was so rampant that in the late 1800s, a Chicago newspaper set a trap by publishing a story with a fictional proclamation in an obscure language that, read backwards, declared: “The McMullens will steal this for sure.” They did, and the plagiarism was exposed. In the 20th century, as professional standards were applied to the craft of journalism, plagiarism became unacceptable, though not eliminated. *Time* magazine began in 1923 by rewriting stories clipped from unattributed newspapers before adding its own correspondents. Even in the 1970s, a cadre of newspaper columnists across the nation regularly sent copies of their published writings to each other with the

understanding that they were free to reuse without credit. Foreign correspondents cribbed from local papers into the 1980s. But generally, these were notable exceptions to plagiarism prohibitions.

Although journalistic plagiarism is an ethical rather than a legal matter, one lawsuit has come before the U.S. Supreme Court, in 1918. The AP complained that a rival news organization, William Randolph Hearst's International News Service, was filching AP copy and distributing it as its own. The court ruled that a news organization could not claim property rights simply by being the first to report on an event. Instead, the court ruled that the AP was a victim of unfair business practices because International News Service was "endeavoring to reap where it has not sown." The justices concluded that using a competitor's story as a tip to independently produce a new version was acceptable, but systematically rewriting someone else's work was misappropriation. The decision did not use the word plagiarism and its practical effect was to establish a relatively high bar for when copying became illegal. Still, the ruling established the quasi-property value of journalism and affirmed the prevailing idea that plagiarism was wrong.

PODCASTING

Podcasts have become one of the most popular mediums in 21st century journalism. Podcasts combine the immediate, aural qualities of radio with the accessibility and mobility that technology allows via the internet, smartphones, and mobile devices. They are also relatively inexpensive to create and disseminate—and easy to listen to, too.

Typically, podcasts are episodic series of narrated digital audio files (commonly MP3s) that a listener can download to a personal device or just play from a website or app. The term *podcast* is widely believed to originate from the combination of "iPod," where podcasts were first played in their infancy, and "broadcast." Although some challenge that origin story and argue that "podcast" may actually stem from the notion of "portable-on-demand" casting.

Nevertheless, podcasting—both the production and the listening—have gained immense popularity in the United States and abroad. There are more than 1.5 million podcasts of all shapes, sizes, and subject matter. People listen to podcasts for news, opinions, entertainment, interviews, sports, the arts, beauty advice, shopping and cooking tips, serialized fiction, nonfiction, and more. Even as

millions of people are listening, those numbers are only increasing.

This entry examines the history of podcasts, famous podcasts, where to find podcasts, the do-it-yourself ethic that continues to guide their production, and their ongoing growth and relationship to advertising.

History of Podcasts

The medium of podcasting originates from another popular form of communication—blogging. Podcasting builds off blogging and adds audio and sometimes video files that can be played on a computer or a mobile media device.

The term *podcasting* was brought to popular attention by BBC journalist and newspaper columnist Ben Hammersley. In February 2004, he wrote an article for *The Guardian* about a new form of automatically downloaded audio programs, and he pondered, “But what to call it? Audioblogging? Podcasting? GuerrillaMedia?”

The *New Oxford American Dictionary* added “podcast” in 2005 and made “podcast” that year’s word of the year. When the respected reference asked Hammersley where he found the word, he said he just made it up to fill space for the article.

Louisville, Kentucky, resident Dannie Gregoire is also given credit for creating the term. He used the term *podcasting* in a September 2004 ListServ message to describe the automatic download and synchronization of audio content. Gregoire has since registered several “podcast”-related domains, such as podcast.net.

Also in 2004, Adam Curry, former MTV video disc jockey, created a show, “The Daily Source Code,” which is credited as one of the first podcasts ever. To distribute his show, Curry used the technology of “Really Simple Syndication,” or the RSS feed, which American software developer Dave Winer helped create. There was a precedent: In October 2003, Canadian actor and filmmaker Matt Schichter created a weekly interview show called *The BackStage Pass* that was broadcast online and has also been credited as being one of the first podcasts.

A podcast series often features one or more recurring hosts leading a discussion about a particular topic or current event. Content can vary

widely in subject matter and perspective and can range from meticulously scripted to completely improvised. Joe Rogan, a comedian and actor who hosts “The Joe Rogan Experience,” has created one of the most popular podcasts in the world. While his interviews with celebrities, comedians, authors, and sports figures seem improvised and off the cuff, Rogan and his team purportedly do a fair amount of preparation and research beforehand.

Podcasts often combine complex and creative sound production with thematic issues ranging from scientific research, arts and entertainment, and the environment to journalism that delves deep into a crime or offers a snapshot of someone’s life experience.

Podcasts rely on social media and frequent posts to update audiences on new episodes. However, as Martin Spinelli and Lance Dann argue in their book, *Podcasting: The Audio Media Revolution*, podcasts are not merely dependent on social media to get the word out about new content. They are “a new form of social media in and of itself,” because of the high level of audience interaction and engagement. Podcasters have been known to go back and revise or edit previous episodes based on listener feedback.

Many podcast series are housed at an associated website with links and show notes, transcripts, artwork, community discussions, and more.

Famous Podcasts

In 2014, radio journalist Sarah Koenig began hosting and coproducing a podcast series titled “Serial.” Season 1 investigated the mysterious 1999 murder of Korean American student Hae Min Lee in Baltimore County, Maryland. “Serial” gained a popular following, with more than 68 million downloads by February 2015, according to CBS News, and more than 80 million downloads by February 2016, according to *The Washington Post*. “Serial” won a prestigious Peabody Award in April 2015 for its long-form nonfiction storytelling and for bringing podcasts into the mainstream. It was the first podcast to win a Peabody.

Stand-up comedian Marc Maron, who previously did a radio show on Air America, started “WTF With Marc Maron” in September 2009. He generally records his interviews in his Los

Angeles home garage. Maron has featured many well-known guests on his podcast, including Robin Williams, Ben Stiller, Sean Penn, Chris Rock, Janeane Garofalo, Sarah Silverman, and Bruce Springsteen. In June 2015, Maron interviewed President Barack Obama in his garage, as secret service personnel stood by and observed. It was the first time a sitting U.S. president appeared as an interview guest on a podcast.

Many podcasts are also radio shows, including “The Daily” by The New York Times; “Radiolab,” hosted by Jad Abumrad and Robert Krulwich; “Snap Judgment,” hosted by Glynn Washington; and “This American Life,” hosted and created by Ira Glass.

“Radiolab” is known for its innovative mixing of sounds, voices, speech editing, storytelling, and science.

A November 2019 episode of “This American Life,” titled “The Out Crowd,” examined firsthand the effects of President Donald Trump’s “Remain in Mexico” asylum policy. The episode won the 2020 Pulitzer Prize for audio reporting, becoming the first podcast to win that prestigious (and new) journalism prize.

Some other popular podcasts include National Public Radio’s “Code Switch”; “Food 4 Thot,” featuring LGBTQ writers and issues; the CBC’s “Personal Best,” a comedic self-improvement program hosted by Rob Norman and Andrew Norton; “Dirty John” by the Los Angeles Times; “Decoder Ring” by Slate; and “Home Cooking” with Samin Nosrat and Hrishikesh Hirway.

It is not that difficult to create a podcast. Therefore, a significant number of celebrities, journalists, and pundits have produced their own podcasts. Part of the beauty is the accessibility and the fact that nearly anyone can do it.

“Call Her Daddy”—a popular 20-something sex, dating, and comedy podcast—had a very public spat and breakup in spring 2020 between its two hosts, and only one, Alexandra Cooper, emerged as host of the show. (After several months, former co-host Sofia Franklyn launched her own podcast, “Sofia with an F.”)

While there was plenty of drama and public finger-pointing to go around, the incident also highlighted struggles that podcasts are facing, especially over money, equity, and who owns the content.

Podcast journalist Nick Quah produces a weekly newsletter on the podcast industry called *Hot Pod*. He also hosts his own podcast called *Servant of Pod*, which covers the podcast universe. Quah has identified a major split between independent, grassroots podcasts and those owned or controlled by large, corporate entities such as Spotify, SiriusXM, iHeartMedia, and Warner Bros.

As the larger companies purchase smaller podcast outfits and consolidate their holdings, a fight and debate rages over who owns the intellectual property of the podcasts. Is it the podcasters themselves, or the companies that have made big, splashy deals with the “talent” to control the content?

Where to Find Podcasts

In the early days of podcasts (early to mid-2000s), Apple’s iTunes served as home base for many of the new and established podcasts. The podcasts would also find an anchor on the internet, with individual websites providing links to past and present episodes, as well as notes on the host, the guests, events, and previous and upcoming shows.

While the landscape changes almost daily, a handful of companies have emerged as the go-to sources for podcasts: Spotify, Stitcher, SoundCloud, SiriusXM, iHeartRadio, Pandora, and Castbox. Of course, Apple Podcasts still plays a significant role.

Many podcasts also have a video presence; often, it is just the podcast videotaped and replayed, but in some cases, the hosts venture on more elaborate adventures. YouTube is typically the site where the video version of a podcast can be viewed and heard.

A Strong DIY Ethic

At its heart, podcasting stems from a strong do-it-yourself ethic. So the equipment necessary to create a podcast is usually not that complicated or expensive. A potential podcaster needs a computer and a USB microphone. Some examples of popular, yet inexpensive mics include Samson Q2U, Audio-Technica ATR-2100 or ATR-4750, Blue Yeti Nano, and MXL 990.

Other essential podcasting tools include a mic stand or two, headphones, and a soundproof room to record in.

Recording and editing software are also necessary to produce podcasts. Most of the software is available for free or at low cost, at least at the introductory level. Programs include Audacity, Adobe Audition, GarageBand, Recordit, WireTap Studio, and Apple Logic Pro X. For those with professional recording and music experience, ProTools is considered the industry standard for musicians, producers, and engineers.

Last but not least, podcasters usually utilize a podcast host to store MP3s and other files. Some examples are Blubrry, BuzzSprout, Captivate, Libsyn, Omny Studio, PodBean, Simplecast, and Whooshkaa.

Growing Audiences and Advertising

Listenership has been trending upwards since 2010. In 2010, approximately 70 million Americans 12 and older listened to podcasts, according to Edison Research. In 2020, about 155 million Americans 12 and older had listened to podcasts, representing about 55% of the U.S. population, according to “The Infinite Dial,” a national survey published by Edison Research and Triton Digital. Monthly podcast listening was at 37% of the U.S. population in 2020, according to the survey.

While podcasts are recognized for their mobility, listening to them at home has been on the rise, particularly in times of economic hardship and pandemic. There has been significant growth in smart speakers in U.S. households, with 27% of the population (76 million people) owning the devices in 2020, compared to 7% in 2017.

Advertising dollars continue to flow into podcasts, and spending has also been trending higher. In 2019, advertisers spent \$708.1 million on podcasts, according to eMarketer, a market research company that follows digital marketing and media. Advertisers were expected to spend \$782 million in podcast ads in 2020, and jump nearly 45% to spend \$1.13 billion in 2021.

The future of podcasting looks bright, but the specifics are still somewhat uncertain. Journalism schools across the country are now offering courses on creating and understanding podcasts. While podcasting remains a fertile source for independent journalism, interviews, and storytelling, large companies continue to purchase smaller entities and consolidate. Television shows with large or dedicated fan bases, media conglomerates like

Disney, and even retail stores like Trader Joe’s feature their own spinoff podcasts.

Meanwhile, the traditional forms of media continue to look toward reinvention in the form of podcasting. The New York Times, Los Angeles Times, NPR, BBC, and ESPN are nabbing talent from the podcasting universe and ensconcing them—along with generous resources—into their online audio divisions.

Established journalistic and media boards, such as Pulitzer and Peabody, are recognizing podcasts with awards. While other media are experiencing worrisome declines in audience, revenue and investment, podcasts continue to enjoy an upward trajectory.

POLITICAL REPORTERS

This entry focuses on political reporters in mainstream news organizations in the United States. For the purposes of this entry, three attributes

define the political reporter of the professional mainstream: delivering news and analysis with the next election always in mind; offering fact-based information with the stated purpose to inform, not persuade; and striving for independence despite financial pressures and the lure of taking sides in a polarized country.

The reasons journalists pursue politics as a specialty are as varied as their backgrounds. Some are attracted by the rich narratives of elections; others relish the role of political watchdogs. Some are drawn by the policy debate. Others seek to rub shoulders with the powerful or hope to reform a system they see as tilted to the privileged. Regardless of their motives, this group of journalists specializing in politics has played a critical role in American democracy, and their reach has extended to all forms of media. Since the 1960s, these journalists have grown in influence and attracted controversy as they have performed the role of what communications scholar Philip Seib called the “essential referee.”

Political reporters constitute one subset of the many journalists who cover public affairs, including those who monitor city halls, school boards, statehouses, Congress, and the White House. Political columnists and other opinion journalists constitute another subset, although they sometimes overlap with reporters who provide “analysis.”

Newspapers framed the political discourse of the 19th century and, joined by national news magazines, dominated political journalism through the mid-20th century. Starting in the 1950s and for the next four decades, the broadcast television networks framed national politics in the United States. Since the 1990s, cable news and the Internet have ushered in a more chaotic media environment. Each epoch has created new types of political reporters.

For example, broadcast television introduced the news anchor, a prominent figure encompassing the roles of editor, reporter, and commentator. At the national level, news anchors have played important roles in political journalism, presiding over national party conventions and election nights and moderating presidential debates. Many of these anchors first gained prominence as political reporters, starting with the most celebrated of them, Walter Cronkite (1916–2009). This entry discusses the origins of political reporting in the

United States, the move toward objectivity and the increased influence of political reporters over the 20th century, changes in political reporting resulting from new forms of media, and the rise of the fact-checking model of political journalism. The entry concludes with a discussion of some prominent U.S. political reporters since the mid-20th century.

Origins

The entanglement of American journalism and politics dawned with the republic. By the first truly contested presidential election of 1800, partisan newspapers provided the political discourse between the burgeoning parties—Federalists (Hamiltonians) versus Republicans (Jeffersonians). The partisan press peaked in the 19th century when Andrew Jackson won office through the creation of a network of partisan newspapers that survived off party advertising and government contracts.

These journalists would be more familiar today as political operatives or hosts of political talk shows. But the early partisan press was also part of the democratization of the young country’s politics, a path of upward mobility by artisans and immigrants who manned the presses. Not until the early 20th century would the new profession of journalism draw from the nation’s educated elite, and even today political journalism remains a route for strivers to climb the social ladder.

The importance of partisan journalists began to fade in the late-19th century with urbanization and media commercialization. Newspaper editors replaced their loyalty to the party with allegiance to advertisers and the large circulations they demanded. Journalists were still connected to politics, but the seeds were sown for the pursuit of a goal that would mark the political reporter in the next century. They sought to be independent political voices, not party mouthpieces.

Three of the most famous “independent” journalists of the second half of the 19th century—Horace Greeley (1811–1872), Joseph Pulitzer (1847–1911), and William Randolph Hearst (1863–1951)—were political power brokers who held elective office during their careers. Greeley and Hearst had ambitions for the White House. As late as 1920, both major party nominees, Democrat James M. Cox (1870–1957) and

Republican Warren G. Harding (1865–1923), were Ohio newspapermen. Since that election, however, rising professional standards of independent journalism have argued against such direct political involvement.

Objectivity and Influence

Starting in the 1920s, the “objective” school of journalism arose with the growing professionalism of the craft. The goal was to separate opinion from fact-based news, and political journalists adopted distinct job descriptions. Columnists wrote commentary and reporters chronicled the words and actions of politicians. The reporters were bounded by the objective goals of balance and impartiality, which often translated into deference to authority. Campaign reporters rarely ventured beyond accounts of the candidates’ speeches and travels, and they turned a blind eye to the candidates’ personal lives.

This passive role of the political reporter was transformed by several factors, starting in the 1960s. Social upheaval over the Vietnam War gave reporters a new license to question authority. The journalistic exposé of the Watergate scandal also supercharged the adversarial role of the reporter. The era also witnessed changes in electoral politics that enhanced the influence of the new breed of better educated political reporters. Party organizations withered as direct primaries and television advertising gave politicians direct access to voters, bypassing party leaders. Money flooded into the process to pay for the advertising. The new politics created subspecialties in reporting beats to cover media advertising and to follow the money. News organizations increasingly used public opinion polls to track campaigns.

In the vacuum left by party leaders, political reporters became gatekeepers. Increasingly, reporters decided whether candidates met “expectations”—frequently set by the reporters themselves—in the outcomes of primaries or televised debates. Whether a candidate’s gaffe became a crippling mistake rested with reporters.

The journalistic form also changed. Theodore H. White (1915–1986) reshaped the campaign narrative with his *Making of the President 1960*, the first in a series of books by White and his imitators, who created a new genre. No longer

would coverage center on chronicling a campaign; instead, the campaign unfolded as a dramatic story, told from the inside. The genre would bring new attention to the character of the politicians.

The change in the role and prominence of political reporters was classically captured by *Rolling Stone* writer Timothy Crouse (1947–) in his 1973 book, *Boys on the Bus*. Crouse portrayed the press corps as a traveling band of mostly male reporters from the big newspapers, news magazines, and television networks, who rated the winners and losers. He coined the term “pack journalism”—referring to the tendency of reporters to produce homogenous coverage. Most barriers to women in the political press had fallen by the mid-1980s, but the problem of pack journalism remains.

The 1980s witnessed growing scrutiny by reporters of the personal behavior of politicians. In 1987, reporters exposed an extramarital affair of the Democratic presidential frontrunner, Colorado Senator Gary Hart, which led to him ending his campaign for the 1988 presidential election. In the same period, political scholars, who had long discounted the role of journalists in shaping elections, began to attribute significant influence to journalists as framers of elections. But scholars also criticized the political reporters for being too focused on the “horse race.”

The rising influence of political reporters was fueled by television. The broadcast networks introduced political reporters who would soon achieve fame surpassing that of some candidates. Network correspondents engaged in reporting that was interpretative (*instant analysis*), distinctly mediated (*sound bites*), and highly visual. The three networks lavished money on the coverage by employing expensive and mobile technologies and building sophisticated political units. The correspondent’s *voice-over* came to dominate the story.

As political changes reshaped journalism, so journalism transformed politics into an activity increasingly governed by media. Satellite technology drew candidates out of the auditorium to picturesque backdrops and staged events by making live coverage possible from virtually anywhere. Media strategies became central to campaigns.

New Media

The mid-1990s ushered in technological changes that not only transformed the news media at large but had profound effects on political journalists. A more fragmented, financially unstable, and polarized media system emerged. Sometimes called the “digital age,” it has introduced new important players, weakened the role of the reporter gatekeepers, and by the end of the 2010s, produced a president who threatened fact-based journalism.

By the late 20th century the label “new media” was applied to Internet entities, but change was occurring in other media as well. AM radio, then virtually moribund, was revived in the late 1980s as caustic conservatives such as Rush Limbaugh (1951–2021) turned talk radio into a new communication genre. Talk radio also offered burgeoning cable news a model for panel shows featuring rowdy debate.

Former Atlanta radio talk jock Sean Hannity (1961–) thrived as a major conservative and partisan voice on Fox News. Although liberal talk radio never produced large audiences, liberal voices prospered on cable television, including MSNBC’s Rachel Maddow (1973–). Neither Hannity nor Maddow pretended to be objective reporters, but the distinction is often lost on the public, if for no other reason than frequent guests on their shows, and others like them, are print political reporters who provide commentary. Becoming a cable “talking head” has provided a new lucrative sideline for political reporters.

Cable television entered the media content business in the late 1970s, first in entertainment, then in news. CNN and C-SPAN launched in the 1980s and were joined by MSNBC and Fox News in the mid-1990s. The rise of Fox was an important development.

While declaring itself “fair and balanced,” Fox attracted conservatives who viewed it as an alternative to what they perceived as the liberal slant of the broadcast networks and public broadcasting. Studies by the nonpartisan Pew Research Center since 2000 have shown a steady rise in the polarization of media choices. Conservatives rely overwhelmingly on Fox and other conservative media. Liberals and moderates have displayed somewhat more diverse choices in MSNBC, CNN,

NPR, and newspapers such as *The New York Times* and *The Washington Post*.

Entertainment programs joined in this political mix, as candidates sought alternative venues that sidestepped the political reporters. The 1992 presidential campaign saw Bill Clinton play his saxophone on the *Arsenio Hall* show. Comedians such as Jon Stewart (1962–), host of *The Daily Show* from 1999 to 2015, took to quizzing politicians along with the reporters.

As cable siphoned entertainment and news audiences in the 1990s, the broadcast networks retreated from political coverage, cutting staffs and folding political units. The networks remain important, but the political media world shifted toward cable television. The watershed of this trend came in 2008 when for the first time cable news audiences exceeded the broadcasters’ viewership for the political conventions and election night. In the same period, other mainstays of the political press corps, the large metropolitan newspapers and the national news magazines, climbed off the bus as newsrooms shrank. In 2008, *Newsweek* published its last behind-the-scenes campaign book, a fixture in coverage for decades.

The culprit behind the retreat of the metro dailies and the news magazines was the rise of the Internet, which undercut the advertising lifeblood of the print media. The online revolution that began in the mid-1990s had a global impact, but for political journalists, the changes were as profound as when television arrived on the scene 40 years earlier. Political reporters found a new virtual campaign to cover.

The Virtual Trail

Editor and Publisher magazine declared 2000 “The Year of the Internet,” and similar proclamations would echo for the next four presidential election cycles as each cycle witnessed a new technological innovation with its own discrete impact on political reporters. In 2000, websites emerged as a new platform for both campaigns and news organizations, including new journalism entities. The conservative *Drudge Report* rose as an important aggregator of political news, and Internet-only political magazines, such as *Salon* on the left, came on the scene.

Bloggers, short for publishers of weblogs, took the stage in 2004 as highly partisan players who not only debated each other but often aimed their criticism at the mainstream political press. Indeed, bloggers helped topple a prominent political reporter during the 2004 campaign, CBS anchor Dan Rather (1931–). Conservative bloggers helped to discredit documents that Rather's *60 Minutes* team had used in a report questioning President George W. Bush's service during the Vietnam War. Rather retired from CBS in the ensuing flap.

Social media platforms launched in the first decade of the 21st century quickly became important features of political campaigns, particularly Facebook and YouTube. Barack Obama's 2008 presidential campaign demonstrated how Facebook could bypass reporters to reach millions of voters directly. YouTube made an already highly visual politics even more so. It also demonstrated the cross-platform flow of news in the new media system. Video shot by a television network's young producer (an *embed*) on the campaign plane or pictures of a candidate on a rope line by an unpaid, activist "citizen journalist" could almost instantly be uploaded to YouTube and if sensational enough, be replayed on cable news. The reverse—colorful video originating on cable and replayed on YouTube—was also true.

No social media innovation changed the political reporter's day-to-day routine more than Twitter, which by the 2012 presidential cycle had been fully adopted not only by reporters but by the entire political class. In effect, it became a political wire service and the primary channel for politicians to communicate with reporters. It also provided political journalists with an avenue to build their own brands with a steady stream of *tweets* breaking news or reporting trivia from the trail. Critics argued that the platform exacerbated the old problem of pack journalism and offered reporters a skewed version of reality because of the unrepresentative nature of the Twitter audience.

By the 2020 election cycle, reporters once accustomed to the leisurely deadlines of morning newspapers or evening news shows were tasked with filing breaking stories to their organization's websites, tweeting or posting to a blog, and possibly shooting video with a smartphone. The political media was no longer segmented between

old and new media but had formed one media ecosystem with information flowing seamlessly across platforms.

One entry to the political game, launched in 2007, was Washington, D.C.-based Politico. The political news website carried out its motto of "win the morning" by scooping the competition even on the most minor of matters. While most of the digital media organizations then arising had a left or right slant, Politico played it straight with traditional political journalism aimed at niche audiences. The subsidiary of Allbritton Communications grew into a limited circulation print newspaper in Washington, an online magazine, a high-dollar policy-oriented subscription service, and a European edition.

The Internet had many effects on political journalism, including allowing all reporters to tap information once reserved for the elite media. Polling data became easily accessible on online venues such as RealClearPolitics. One effect of this democratization was to fuel the horse race story. The Internet also supercharged a journalistic specialty—"fact checking"—that dated to the late 1980s when there was a spike in misleading television advertising.

Fact Checking

Newspapers introduced the "ad watch" and television news tried "truth squading" the ads in the 1990s, but it wasn't until 2004 that the nonpartisan FactCheck.org, employing political reporters, showed how the capacity and interactivity of the Internet could provide a fact-checking platform. By the 2008 cycle, other fact checkers joined in, including *The Washington Post's* Fact Checker team that awarded "Pinocchios" and PolitiFact that employed a "truth-o-meter" graphic. PolitiFact won a Pulitzer Prize for its coverage of the 2008 campaign, the first time the prize was awarded to a web-based organization. While fact checking won plaudits for fulfilling the watchdog role, it also stoked the adversarial approach of political journalists.

Few of the fact checkers foresaw how they would be drawn into a historic clash with President Donald J. Trump, who during his campaign and after his election in 2016 used hyperbole and falsehoods daily to attack his political opponents

and the media. News organizations dropped niceties such as avoiding the word “lie” in describing the president’s messages. In 2019, CNN aired an hour-long documentary entitled “All the President’s Lies.” At the end of that year, the Post’s Fact Checker cataloged more than 15,000 false or misleading statements by Trump.

Trump is not the first politician to attack the press as part of a political strategy. Many date modern conservatism’s media critique to November 13, 1969, when then–Vice President Spiro Agnew used a speech in Des Moines, Iowa, to attack the broadcast networks for critical coverage of the Nixon administration, including the instant analysis and other interpretative techniques broadcasters were then introducing. Trump is also not the first demagogue to make the news media an unwitting accomplice in spreading a false appeal. In the 1950s, media-savvy Senator Joseph R. McCarthy used the unquestioning wire services as the conduit of his “red-baiting” charges that ultimately were proved false.

In the 2016 campaign, Trump used his reality television skills to dominate television coverage during the Republican primaries with sensational appeals. His unorthodox use of Twitter to air outrageous charges is often attributed to his desire to energize his supporters. But that analysis ignores its potency as a media strategy. As of 2019, only slightly more than a fifth of Americans used Twitter, while it had already become a required tool for every political reporter. One study during the 2016 campaign estimated Trump drew so much television coverage that it was the equivalent of \$2 billion worth of paid advertising. The increase in circulation of newspapers such as *The New York Times* was dubbed the “Trump bump.”

As welcome as the stimulus might be to a financially fragile industry, many journalists acknowledged that Trump’s incessant attacks on “fake news” and his labeling of political reporters as “enemies of the people” have taken a toll on the profession’s credibility. And, in responding to Trump, traditional journalists worried that reporters were resorting unwittingly to their partisan origins of two centuries ago.

The lasting impact of the Trump era remains to be fully understood. Most professional journalists who cover politics remain committed to the ideal of the independent arbiter that arose in the last half of the 20th century. Yet political reporters in

the new era are more embroiled in the political debate and called upon to defend fact-based journalism when their influence is diminished in a much-changed media environment. Never has the political reporter’s role as the essential referee been less appreciated and more necessary.

Examples of Prominent Political Reporters

R. W. “Johnny” Apple Jr. (1934–2006)

Apple set the standard of the influential political reporter in his more than four decades with *The New York Times*. The son of an Akron, OH, businessman and educated in the Ivy League, Apple was the model of the brash and aggressive reporter. He is credited with first recognizing the importance of the Iowa precinct caucuses that propelled Jimmy Carter to the White House in 1976. In the ensuing three decades, Apple, known for his front-page analysis stories and fascination with the unfolding campaign, set the example for a generation of influential *Times* political reporters. Peter Baker (1967–), chief White House correspondent for the *Times* as of 2021, has continued to deliver big analysis pieces for the newspaper. Unlike Apple who rarely appeared on television, Baker frequently appears on NBC, PBS, MSNBC, and CNN.

David S. Broder (1929–2011)

Broder, who covered 13 presidential elections starting in 1960, was arguably the most respected political reporter of a generation. Growing up in a Chicago suburb, Broder combined graduate study in political science with a boyhood love of newspapers to land at *The Washington Post* in 1966 after quitting *The New York Times*. Over the next 40 years, Broder helped build the *Post*’s political coverage to rival that of the *Times*.

A reporter who also wrote a column, Broder hewed to a centrist approach. He inspired reporters to critique the mechanics of politics and to use shoe-leather reporting as well as polling to explain voter behavior. He won a Pulitzer Prize in 1973 and authored or coauthored eight books, including his 1987 *Behind the Front Page: A Candid Look at How News Is Made*. A Broder protégé, Dan Balz (1946–), chief correspondent for the *Post* covering national politics, the presidency, and

Congress as of 2021, has followed in his footsteps as a highly respected reporter and columnist.

Elizabeth Brenner Drew (1935–)

Drew led a cohort of women who entered the ranks of political journalism in the 1960s. A Cincinnati native and Wellesley College graduate, Drew became a prolific magazine reporter, book writer, and television commentator. For almost 20 years starting in 1973, Drew wrote *The New Yorker's* “Letter From Washington” dispatches from a capital she portrayed as increasingly dominated by the corruption of money.

In a 1983 book, *Politics and Money: The Road to Corruption*, Drew presciently recognized the flow into politics of unregulated large donations of “soft money,” a term she popularized. Drew, who in 2015 published a new edition of her 1975 book *Washington Journal: Reporting Watergate and Richard Nixon's Downfall*, continued to write op-eds during the Trump impeachment.

Jack W. Germond (1928–2013)

Germond and his partner for a quarter century, Jules Witcover (1927–), wrote a column for the *Baltimore Sun* that relied more on reporting than opinion and coauthored a series of books on presidential campaigns from 1980 to 1992. Growing up in a middle-class Boston family, Germond used the GI Bill to pay for journalism education at the University of Missouri, followed by several decades in newspaper jobs. But television talk shows made the bald and rotund Germond the most unlikely of media stars, starting with the *McLaughlin Group* in 1981 and later on CNN and public broadcasting. The irascible, irreverent, and liberal Germond crystallized the caricature of the political road warrior, which he described in his 1999 autobiography, *Fat Man in a Middle Seat*. Germond said he only appeared on the fractious McLaughlin show for the money, but he was a forerunner of print journalists who found a wider audience on talk television.

Jeff Greenfield (1943–)

Greenfield, a commentator for PBS's *Newshour* and a columnist for *Politico Magazine*, is an example of the political analysts who act as

independent political sages. The son of a New York lawyer, Greenfield is a graduate of Yale Law School who began his career as a Democratic consultant. Starting in 1983, he was the lead analyst for ABC News before moving to CNN in 1998 and then CBS in 2007. Known for his grasp of history, Greenfield gave CNN gravitas during the turbulent 2000 and 2004 elections. Writing widely on politics and media, he authored or coauthored 11 books, including the 2001 *Oh, Waiter, One Order of Crow: Inside the Strangest Presidential Election Finish in American History*.

John F. Harris (1963–)

Harris took traditional political journalism to the web, helping to create the digital media company, Politico, in 2007. Harris got the journalism bug in college in Minnesota and landed a *Washington Post* internship in 1985, where he stayed for 21 years, rising to national political editor. Harris and *Post* reporter Jim VandeHei (1971–) hatched the idea of using the dexterity of the Internet to aim political news at the niche audiences of Washington insiders and political junkies.

With the deep pockets of Allbritton Communications Inc., Harris, editor-in-chief, and VandeHei, executive editor, pushed their newsroom in the pursuit of scoops that with some aggressive promotion set tongues wagging. In 2019, Harris stepped down as top editor to write a weekly column, including one soul-searching missive on whether he and his colleagues suffered from a “centrist bias” that caused them to underestimate the more extreme politicians, including Trump.

Gwen Ifill (1955–2016)

Moderator of PBS's *Washington Week* and coanchor of *The NewsHour*, Ifill was a testament to the upward mobility of political journalism. The daughter of a poor Black immigrant preacher in New York, Ifill built a career as a political reporter following the path of her white male predecessors. She came up through newspapers—from the city beat for the *Baltimore Sun* to the White House for *The New York Times*—and then to NBC News. In 1999, she pierced racial and gender ceilings to enliven and revitalize *Washington Week*, an

institution of political journalism for almost 40 years. In 2019, the U.S. Postal service commemorated Ifill with a Forever Stamp.

Brooks Jackson (1941–)

As a reporter for the Associated Press and *The Wall Street Journal*, Jackson pioneered the “money and politics” beat in the 1980s. The product of small-town Indiana, he arrived in Washington for the AP to help cover Watergate. In 1988, Jackson authored a respected book on campaign finance, *Honest Graft: Big Money in the American Political System*. He moved to television at CNN and in the 1992 election developed systematic truth testing of campaign messages. He took the approach to the Internet in 2004 to help found FactCheck.org, where he remained director emeritus as of 2021.

James C. Lehrer (1934–2020)

Lehrer, former executive editor and anchor of PBS’s *NewsHour with Jim Lehrer*, was the quintessential journalist as a referee, moderating 12 presidential debates and helping establish public broadcasting’s role in political journalism. Born in Wichita, KS, Lehrer got his start in Texas newspapers. Beginning with the coverage of the Watergate hearings on public television, Lehrer teamed with Robert MacNeil (1931–) to make the *NewsHour* the premier public affairs television show. Lehrer’s evenhanded and unflappable style made him the choice of both sides of the partisan divide for his unique role in presidential debates. He moderated his last presidential debate in 2012 but remained on the Board of Directors of the Commission on Presidential Debates until his death at 85 years of age.

“Cokie” Roberts (1943–2019)

An analyst for National Public Radio and ABC News, Roberts helped establish NPR as a player in political news in the 1980s and became one of the most prominent women political journalists. A New Orleans native-born Mary Martha Corinne Morrison Claiborne Boggs, Roberts grew up in a politically prominent Washington family, and she brought her insider knowledge to NPR in

1978 as a congressional correspondent. With Linda Wertheimer (1943–) and Nina Totenberg (1944–), she formed a trio of women reporters who elevated NPR’s Washington reporting. While keeping her NPR job, Roberts became a panelist on ABC’s *This Week With David Brinkley* in 1988 and coanchor of the Sunday talk show from 1996 to 2002.

Timothy J. Russert Jr. (1950–2008)

Russert was the moderator of NBC News’s *Meet the Press* and was considered political journalism’s chief inquisitor. A blue-collar kid from Buffalo, Russert, a lawyer, entered journalism from New York Democratic politics. In 1984, Russert landed a job as an assistant to the president of NBC News and worked his way up to Washington Bureau chief for the network, and then moderator of the 60-year-old Sunday talk show *Meet the Press* in 1991. Russert took the show to dominance with a new format centered on him interrogating the powerful and frequently confronting guests with their impolitic past comments. Some observers have likened the program to a presidential primary test for White House hopefuls, a tradition carried on by the successor host Chuck Todd (1972–), also an aggressive interviewer.

Judy Woodruff (1946–)

Woodruff, anchor and managing editor of PBS’s *NewsHour* and one of the most recognized faces in political journalism, started her career as a “weather girl” for an Atlanta television station in 1969. The daughter of a soldier, she was the first in her family to attend college, Duke University. In the mid-1970s, Woodruff, then in NBC’s Atlanta Bureau, followed Georgia Governor Jimmy Carter to the White House for NBC. She continued covering the White House during the early years of the administration of President Ronald Reagan before leaving to work for a decade at PBS. In 1993, Woodruff moved to CNN, and for the next 12 years, she helped turn *Inside Politics* into one of the most watched cable news political shows.

POLLS AND PUBLIC OPINION

Public opinion represents the collective views of all private individuals in a society. As democracies purport to serve the public's interest, governments, media, and public officials often feel it necessary to heed public opinion. However, since the views of the people are privately held, we need a means to measure them. This is the function of polls and surveys. Thus, journalists and media often report on polls to contrast public opinion with the views of public figures.

This entry discusses polls, their development and application, and how they apply to the practice of journalists. The entry also discusses public opinion, particularly its formation, effects, and complicated relationship with polling. Modern polling and the study of public opinion have their roots in horse-race polling. In early horse-race polls, newspapers attempted to measure who may win an upcoming election. This practice remains common two decades into the 21st century.

Unlike early polls, scholarship focusing on public opinion did not gain widespread traction until the mid-20th century. The concept of collective public opinion may date back to Renaissance or even Greco-Roman thought. Yet, modern public opinion scholarship is rooted in the work of 20th-century scholars such as theorist Jürgen Habermas (1929–), political scientists V. O. Key (1908–1963) and Philip Converse (1928–2014), and journalist and communication scholar Walter Lippmann (1889–1974). It was these individuals who helped to popularize the concept of public opinion and its subsequent measurement via polls and surveys.

Polls

The earliest polls in the United States date back to the early 19th century. In these early polls, newspapers would conduct an ad hoc survey of their readers regarding their preferred candidate in an election. These pioneering polls suffered from many forms of error that would not be rectified until the mid-20th century. However, these early polls are not so fundamentally different from their modern counterparts.

Polls consist of a series of rigid questions, often a set of fixed possible answers asked of a small subset of the public. This small subset is what is known as a *sample*, which, if taken correctly, can accurately represent the opinions of the public. Typical questions in a poll may ask those responding to detail their opinions on critical current events, public figures, candidates for public office, personal demographics, and more. Individuals who design and field polls are known as *pollsters*. Pollsters typically design polls to be quick and straightforward. The goal is to measure public opinion quickly and efficiently. Surveys are functionally identical in many ways to polls but are not associated with gathering public opinion quickly and are often more exhaustive in their lines of questioning. Thus, surveys are often time-consuming and expensive. Polls, due to their brief nature, can be fielded more quickly and more frequently. As such, polls are more commonly created and fielded. Thus, politicians, citizens, and journalists often reference polls as evidence of up-to-date measures of public opinion.

Polling Error

Early polls and many modern “junk” polls suffer from errors. Indeed, even the most seasoned pollsters can fall victim to different forms of error if not careful. In the case of polls and surveys, error denotes a mistake in measurement, which results in the findings of a poll being unrepresentative of actual public opinion. Since polls do not ask every member of the population their questions and receive responses, there is always a fraction of difference between real public opinion and a poll’s measures of it. This margin of error is commonly represented by a plus or minus of a certain percentage when reporting the results of a poll. For example, a CNN poll in July 2014 found that Barack Obama led Mitt Romney 53%–44% in the race for U.S. president, plus or minus 3%. This means that the poll may be off by 3% in any direction. Obama’s public support was, therefore, likely anywhere between 56% and 50%. Such a margin of error when taking a sample for a poll is unavoidable. However, journalists, citizens, and politicians frequently fail to take the margin of

error into account when discussing who is winning in a poll.

As a rule of thumb, if candidates are within two margins of error of each other, we cannot be sure who is winning. In the case of the Obama poll, he was more than six points ahead, so it seemed assured that Obama was winning. However, said poll was measuring the popular vote not the electoral college responsible for choosing a president. Given the half dozen times a popular vote winner did not reach the White House—as in 2000 and 2016—polls are not a guaranteed prediction. Nonetheless, there are more insidious forms of error beyond the margins to keep watch for in polling: sampling error and measurement error.

Sampling error encompasses both coverage and nonresponse error. It occurs when the population being polled is not adequately represented in a sample. Pollsters typically choose a sample frame for a population, which is a list of people that may be possibly interviewed for the poll. For example, if attempting to poll American public opinion, a pollster may acquire a list of all home phone numbers in the United States. Ideally, a sample is random, so said pollster may choose phone numbers from the list at random or even dial numbers at random. However, what about Americans who do not have a landline-based phone number? Those citizens will be excluded from the poll’s sample, thus creating a biased one. This sample bias is a form of coverage error, wherein the sample fails to cover the population fully.

Nonresponse error is closely related to coverage error. Nonresponse error occurs when individuals who are invited to participate in a survey or poll fail or refuse to do so. For example, an individual may be contacted via phone or email to participate in a poll. If they fail to respond, the resulting poll will not measure the views of that individual and those like them. This can lead polls to be biased against certain groups. For example, phone-based polls often struggle to contact poor individuals without home phones and those with only cell phones. If not accounted for, this can frequently lead polls in the United States to be biased against Democrats, who are often younger and of lower income.

Measurement error occurs when the questions asked of individuals are not valid and reliable measures of public opinion. In other words, measurement error rises when items in a poll fail to measure the concept being asked about or result in inconsistent responses. Several common issues must be taken into account when considering measurement error. First, confusing question wordings can result in unpredictable responses. If two individuals cannot interpret the same question identically, then the question is unreliable. Second, inadequate response options can result in biased or inaccurate responses. If the pollster does not provide the full range of necessary response options to a question, individuals may select another they do not align with or fail to answer the question at all. Third, question ordering may affect the validity of responses. If a prior question cues individuals to respond to others differently, such as by asking about feminism before a question about a woman candidate, then the answers may not represent genuine public opinion. Fourth and finally, social desirability bias can distort responses to questions. Social desirability bias occurs when an individual answers an item not according to their views, but according to the views they expect others want them to have. Examples of desirability altering poll results are common in cases of candidates perceived as especially socially desirable or undesirable. This is often the case for minority candidates who are considered socially desirable and whose support is therefore overestimated. This is thought to have happened with Los Angeles Mayor Tom Bradley, who lost the 1982 California governor's race despite polls before the election showing he was ahead. The opposite is frequently true for candidates seen as socially undesirable, such as Donald Trump, whose support was frequently underestimated in 2016. Pollsters can minimize social desirability bias through proper question wording, but some levels may always be present. It is vital to take into consideration the potential for social desirability bias and other forms of measurement error when reporting on poll results.

Junk and Push Polls

The best polls attempt to minimize all sorts of error, while those that do not are referred to as

junk polls. These “junk” polls frequently are made purely for profit, discarding any attempt to measure public opinion in return for a minimal cost “poll.” Even worse, some polls may intentionally be designed to bias responses and portray public opinion in a certain way. These are push polls, known as such because they attempt to push views on citizens. These “junk” and push polls dilute the water of the higher quality polls around them, reducing public trust in polling and by extension those who use polls as a measure of public opinion. While polls that minimize sources of error can be quality representations of public opinion, the market for “junk” and push polls is vast in the modern political and media markets.

Public Opinion

Without public opinion, polls would have nothing to measure. Public opinion itself is the collective result of the views, opinions, and beliefs of a society. However, the “real” world is so vast, it is impossible for a single human to witness all of its events. Thus, the facts portrayed to the public—often by the news—help citizens to build an imagined conception of the “real” world. This conception, then, yields the foundation of public opinion. A critical point of research and scholarship lies in the investigation of public opinion formation. Why is it that citizens hold the views they do? When do they change?

Socialization and Genetics

Political socialization is a complex process, yet it yields much of every citizen's political views and values. Socialization occurs as citizens grow up and interact with family, friends, teachers, mentors, public officials, and others. Through childhood and early adulthood, individuals internalize the views of those around them and their reactions to those views. This occurs both as individuals acquire information about the world and are encouraged to follow those in their environment. Thus, by the time many citizens enter their 30s, their political opinions and beliefs tend to be more rigid and are the clear product of their previous environments. For example, not only do children tend to share views with their parents but those born around the time of specific events such as the

Great Depression or the terrorist attacks of September 11, 2001, tend to share particular opinions and beliefs. From there on, anytime an individual is asked or polled about a view, their response will be made relative to the beliefs they internalized during their socialization.

The environment is not the sole dictator of opinions, however. Many scholars have identified genetics as playing a key role in certain political attitudes. While an individual's environment during socialization may strongly influence political beliefs, the pathways by which socialization acts are determined by genetics. For example, there is strong evidence that conservatives tend to have stronger physiological responses to threats than liberals. Such evidence portrays the physical and neurological elements to public opinion that are often ignored. Certainly, genetics does not wholly determine the beliefs and opinions of citizens. However, genetics and socialization together form the foundation of public opinion and most responses to polls.

Media Effects

While socialization and genetics produce the basis of public opinion, what makes public opinion malleable are those pieces of information that change over time. Perhaps one of the most critical factors in altering public opinion are media effects, or the effects journalists have through their reporting on the public. There are two central avenues through which news coverage alters public opinion: agenda setting and framing.

Propaganda scholars of the early 20th century were deeply worried by the prospect that mass media could alter public opinion. They feared that the political views of millions would bend to the will of a handful of powerful elites. As of 2020, there is scant evidence that a liberal can be transformed into a conservative through information alone or vice versa. Yet while the political beliefs of citizens cannot be fundamentally altered with a bit of information, information distributed through the mass media can profoundly alter what beliefs and opinions sit at the forefront of their minds.

Agenda setting is the one-to-one correspondence between what issues the news covers and what the public thinks is important. Known as the

public agenda, the priority list of issues for government redress is one facet of public opinion. The public agenda is where media and journalists demonstrate their most potent effects on public opinion. For example, if the news is covering a tumbling stock market frequently, then citizens are likely to name the economy as an important or even the most pressing problem in politics. Pioneered in research by Maxwell McCombs (1938–) and Donald Shaw (1936–), agenda setting is the most prominent effect news—and journalists by extension—can have on public opinion. Polls in the United States show that repeated coverage of an issue by the press can lead vast swaths of Americans to name said issue as the most important in the country. This is a finding replicated in countries around the world. Thus, even if a news story cannot always persuade an audience to its side, the topics journalists choose to cover, how often they cover them, and their prominence can all affect the larger structure of public opinion.

Research into agenda setting has found it has maintained its effectiveness in the digital age. News spotted anywhere from Facebook to forums can alter the agenda of the public. What has changed is the proportion of the people most news stories reach. In the mid-late 20th century, during the age of broadcast journalism, most Americans learned about the day's events through the nightly broadcast news or a local morning newspaper. Even when they did not read or see either, friends or family often passed on the most important stories. This flow of information led to a consensus-building effect. Since most Americans heard the same news from one of a handful of broadcast news sources, the public agenda was considerably consistent. However, competition in the media market has grown with the addition of cable and online news. The resulting abundance of news and information has diminished the consensus-building effect of mass media on the public agenda. Nonetheless, agenda setting remains a critical effect media has on the public.

Public opinion is also influenced by the way information is framed. Framing refers to the way in which the media tell a story by highlighting certain aspects over others. The way a story is framed can lead people to change their opinion on an issue or to temporarily prioritize certain considerations over others. For example, when a story

about a Ku Klux Klan rally in a city is described as a civil liberties issue including references to free speech, the public is more favorable of allowing the event to take place. On the other hand, when the same Ku Klux Klan rally is described in terms of concern for public order and safety, then the public is far less supportive. In other words, describing the same event by highlighting different considerations can lead to significant variation in public opinion about that issue.

Another form of framing studied by Shanto Iyengar highlights the importance of context in framing effects. When a story about poverty, for example, is framed in an “episodic” way, where individual instances and specific events are highlighted, people tend to attribute responsibility for poverty to the individual. Conversely, when a story about poverty is framed in a “thematic” way, where a general context is provided with more in-depth detail, then people are more likely to attribute responsibility to society or the government. While framing effects are well established, some research also finds that allowing subjects to deliberate on the issue will reduce framing effects. Additionally, framing effects are often moderated by other important considerations such as party identification.

Campaigns and Elections

Fundamentally, the goal of a political campaign is to alter public opinion in favor of a candidate or ballot initiative. Politicians and political action committees spend exorbitant amounts of money attempting to change the views and behaviors of the public. They buy ad space in newspapers, on television, and online. Major ad agencies and celebrities are brought to bear to move public opinion by percentage points in the single digits. An election can be won or lost on a single vote, after all. Elections are often characterized by campaigns pushing for public opinion change, news coverage of those pushes, news coverage of polls as a measure of success or failure for those pushes, and then the cycle repeats. Amid these news cycles, the ability of campaigns and news coverage of them to affect public opinion is contingent on two main factors.

First, the number of undecided voters represents the potential impact a campaign can have on

citizens. Partisans and decided voters are not likely to change their views of candidates, and thus are unlikely to be swayed by campaigns or the coverage of them. The more undecided voters there are, the more opportunities campaigns and journalists have to affect the outcome of an election through altering public opinion. Since there are more undecided voters in the earlier days of an election, campaigns and coverage have a more significant net effect on the views of citizens early on.

As the election advances, more citizens become decided. Thus, there is less room for movement in all but the most extreme of circumstances. Of course, polls can influence voters in conjunction with campaigns. Citizens are less likely to support losing campaigns, and polls are our only way of measuring public support. Thus, appearing to be winning in polls is vital for candidates and draws attention to the news when polls are released.

Despite this, early polls are often inaccurate. Since pollsters and journalists rarely include the candidate preferences of undecided voters, poll results often favor candidates with existing support but underestimate those who have stronger campaign operations. For example, in 2008, John McCain was polling far ahead of Obama in the summer before the presidential election. Yet by election day in November, Obama won by a large margin, an outcome predicted by polls in the days just prior to the election. Both of Obama’s presidential campaigns were notoriously efficient and effective in altering public opinion and encouraging turnout.

Also important is the balance of resources between opposing campaigns. Two campaigns with similar but vast fiscal and human resources will marshal far higher persuasive power yet will largely cancel each other out. This is often why, despite enormous amounts of advertising and campaign events, horse-race polls often appear so static. Moreover, more resources mean a campaign is more likely to garner free press by appearing in unsolicited news stories. Resources means that campaigns can also field their own private polls to focus their resources better and preempt any polls that may appear in the press. While the balance of resources may not outright determine an election victory, it is heavily associated with public opinion change, garnering news coverage, and ultimately success on election night.

Media, campaigns, and the public have a complicated, deeply entwined, and often tenuous relationship. Campaigns may exercise their resources independently, buying advertising and canvassing neighborhoods for votes. However, garnering media attention is often critical for increasing the potency of their resources. Media usually like covering elections both because it garners exceptional public attention and it aids in the industry's legitimacy to act as a democratic watchdog. Citizens rely on the media to cover campaigns efficiently when the average voter has little time or information with which to make informed decisions about an election. This triadic relationship is deeply entrenched, but not without its mistrust. Voters are often skeptical of campaigns and media, campaigns often embellish to increase their persuasiveness, and media must balance reporting what campaigns offer them with fact-checking.

Effects on Public Policy

For proponents of democratic superiority, public opinion should ideally dictate public policy in a democracy, representatives acting as translators from public opinion to public policy. Of course, real politics and policy are not so ideal. Public opinion does not always dictate public policy, but there are times when it does. It is in these cases where journalists can have definite, albeit indirect effect on public policy. After all, if the media can alter public opinion and public opinion can dictate policy, then media have an impact on policy.

The primary means through which public opinion and media dictate policy is elections. Elections are the lynchpin of accountability for most modern democracies. As issues and positions gain coverage and importance through an election, expectations are placed on the future winner to fulfill their promises. What promises are made are frequently dictated by media coverage—via agenda setting—and that coverage often focuses on polls as a measure of public opinion on issues. Consequently, elections often dictate the public policy that those who are elected ultimately work to implement.

The second means through which public opinion and media dictate policy is social pressure. Even removed from an election, coverage of an issue and polls portraying public dissatisfaction

can place immense pressure on public officials to make appropriate policy changes. If a government is failing to address a natural disaster, for example, media coverage and public opinion will often coalesce around the issue as coverage intensifies. The solution for officials is to enact a policy to resolve the issue, in this case perhaps providing aid and resources to survivors.

Despite these mechanisms for public and journalistic influence on public policy, there remains some debate on how effective the public and media are in affecting public policy. Many scholars compare polls showing specific policy “moods” or the general public’s ideology and compare that with the types and prevailing ideology of policies passed by the government. What constitutes a good correspondence between public opinion and policy is debatable. Many studies place the similarity between public opinion and policy at 50%–60%. However, one restriction on polls is their inability to measure those who don’t answer a question or frequently respond with “don’t know.” As such, this similarity may be moderately inflated.

One deeply unresolved point of debate is the continually unclear relationship between political elites, public opinion, and the news. Who is really in charge, and thus ultimately dictating public policy? Do elites dictate the news through their actions, effectively controlling public opinion? Or does that public dictate the activities of elites by being represented in polls in the news? Evidence points to the causal arrow being deeply contextual and often multidirectional. In other words, sometimes elites dictate what the media cover and the views of the public, sometimes it’s the opposite, and maybe more often it is both. Nonetheless, there remains a mass of evidence that public opinion, media coverage, and public policy share a deeply entwined relationship.

Polls and Public Opinion in Practice Today

Polls remain our default means of measuring public opinion, and public opinion remains a critical concept in the functioning of modern democracies. Polls and surveys are as vulnerable to different forms of error as ever, even if pollsters are more aware of such issues. We still rely almost

wholly on polls to measure public opinion, even if the wider public is often blind to errors until a poll proves wrong.

Despite shifts in technology, the effects of news and media on public opinion remain sound if more elaborate. Scholars of journalism and political science expend as much effort as ever attempting to understand the complex interplay between measuring and dictating public opinion. After all, the coverage of polls can and does alter the very public opinion the poll means to measure. Investigations are also focusing more heavily on the effects of the Internet or “new” media on public opinion, the steady move to Internet-based polling, newer sampling techniques now that fewer people have landline phone service, and clarifying any long-standing confusion over just what exactly changes public opinion.

POSITIVE FIRST AMENDMENT

The First Amendment to the U.S. Constitution guarantees five basic freedoms: (1) religion, (2) speech, (3) press, and the right to (4) assemble and to (5) petition the government for a redress of grievances. Those who advocate for a positive, or progressive, First Amendment are particularly interested in how the First Amendment affects media law and policy. A positive First Amendment approach insists that the government should have a more active role in promoting a better speech environment for citizens so that a healthier democracy can flourish. This entry first distinguishes between the positive and negative approaches to the First Amendment. It then discusses the positive First Amendment approach in practice, how the negative approach has generally prevailed in court rulings on the news media, and the application of the positive approach to media reform.

Undergirding the vision of a positive First Amendment is the belief that media should represent a diversity of voices and viewpoints—and that government, backed by the First Amendment, should mandate access and create infrastructure that allows for multiple voices. From this view, the First Amendment permits the government to enact policies that ensure public access to important information and to media systems. The view, in other words, holds that the First Amendment imposes obligations on media in addition to protecting media from government censorship.

The contrary view, grounded in what is commonly referred to as *negative freedom or liberties*, holds that the First Amendment exists primarily to

restrain government action, not to promote it. This view holds that the Bill of Rights, of which the First Amendment is a part, is at core an antiauthoritarian document that protects citizens, and media, from government infringement or interference. In other words, this view contends that the First Amendment's purpose is to ensure that citizens, and media, have the right to express ideas openly without consequence or censorship from the government.

First Amendment scholar Ruth Walden once characterized the differences between the two views in terms of the questions they ask about the government's role in promoting or regulating speech. A positive First Amendment approach asks: What do we want the First Amendment to accomplish? Whereas an approach grounded in negative freedom asks: What do we want the First Amendment to prevent? Phrased differently, media scholar Victor Pickard has explained that negative freedom or liberties prioritize freedom *from* government intrusion, while a positive First Amendment approach prioritizes positive liberties such as freedom *for* or *to* a diverse media system. Most media law and policy in the United States traditionally has exemplified the negative freedom approach. But not always.

Positive First Amendment in Practice

Advocates of a positive First Amendment approach point to examples of progressive media policy in practice as well as court decisions that have seemingly defended positive rights. Pickard, for example, highlights the postal system as a classic example of the government building out a communication infrastructure or network and guaranteeing public access. Believing that Americans should have access to reliable and diverse information, the founders of the U.S. government significantly subsidized the development of the postal system and privileged the postal system's educational function rather than its ability to make a profit.

In terms of court decisions, one example of language supporting positive rights appeared in the 1945 U.S. Supreme Court case *Associated Press v. United States*. In that case, the news service the Associated Press argued that the First Amendment guaranteed the organization certain

exemptions to federal antitrust law. The Supreme Court rejected the argument, however. "It would be strange indeed," Justice Hugo L. Black wrote in the majority opinion, "if the grave concern for freedom of the press which prompted adoption of the First Amendment should be read as a command that the government was without power to protect that freedom." The ruling said that the First Amendment "rests on the assumption that the widest possible dissemination of information from diverse and antagonistic sources is essential to the welfare of the public." The Associated Press's business practices that were at issue in the case put newspapers without the news service at a competitive disadvantage. "Freedom of the press from governmental interference under the First Amendment does not sanction repression of that freedom by private interests," Black wrote.

Perhaps the prime example of the Supreme Court championing a positive rights approach was its 1969 decision in *Red Lion Broadcasting v. FCC*. In the *Red Lion* case, the Supreme Court upheld what was known as the *fairness doctrine*. The doctrine, which was generated by the Federal Communications Commission (FCC) in the 1940s, stipulated that broadcasters (on terrestrial radio and over-the-air television) had a responsibility to provide coverage of important public issues that arose in their communities and to ensure in their coverage that they fairly represented all significant viewpoints on those issues. A related aspect of the fairness doctrine stipulated that when a broadcaster aired what amounted to a personal attack on an individual or group, the broadcaster also needed to notify the target of the attack and offer free time for the target to reply.

Ruling that the fairness doctrine and its accompanying provisions "enhance, rather than abridge, the freedoms of speech and press," the Supreme Court upheld the fairness doctrine against a broadcaster who challenged it on First Amendment grounds in *Red Lion*. In the decision written by Justice Byron R. White, the Court ruled that it "is the right of the viewers and listeners, not the right of the broadcasters, which is paramount. It is the purpose of the First Amendment to preserve an uninhibited marketplace of ideas in which truth will ultimately prevail, rather than to countenance monopolization of that market." White

wrote that the public has a right to “receive suitable access to social, political, esthetic, moral, and other ideas and experiences” and that one of the goals of the First Amendment is to produce “an informed public capable of conducting its own affairs.” The fairness doctrine, the Court concluded, was consistent with that goal.

The Prevailing Negative Freedom Approach

Importantly, though, the Court acknowledged that its approach to broadcasters in *Red Lion* was different from its approach to print media generally—and that characteristics of the media forms justified the different First Amendment standards. Terrestrial radio and over-the-air television reach listeners and viewers by traveling on frequencies using the electromagnetic spectrum, which is a finite resource. The First Amendment right to broadcast thus isn’t comparable to “the right of every individual to speak, write, or publish,” the ruling in *Red Lion* noted, and the government (in the form of the FCC) consequently had the right to regulate the broadcast industry in ways such as assigning frequencies to stations and regulating content through mechanisms such as the fairness doctrine. The FCC later stopped enforcing the fairness doctrine in the late 1980s in the midst of a deregulatory push from the agency, however.

The Supreme Court has generally rejected extending the positive rights approach to other media contexts. The opposite view, holding that the First Amendment exists primarily to restrain government action against private speakers, is what has prevailed. Indeed, Pickard has referred to the American media system as *corporate libertarianism*, where the negative rights of media corporations are favored over the positive rights of consumers. A chief example to demonstrate the point is the Supreme Court’s 1974 decision in *Miami Herald Publishing Company v. Tornillo*, where the Court ruled that the First Amendment did not give the government the right to force a newspaper to publish the views or ideas of a citizen. The Court said that the choice of content to go into a newspaper, including decisions about how to cover public issues and public officials,

amounts to decisions that must be made by newspaper editors, not the government. “A responsible press is an undoubtedly desirable goal, but press responsibility is not mandated by the Constitution,” the Court concluded.

Positive First Amendment and Media Reform

Advocates who push for reform of the U.S. media system argue that, as in *Red Lion*, the First Amendment should be viewed as a means for the government to create opportunities for speech and press freedoms. These advocates maintain that a more positive or progressive First Amendment recognizes that concentrated corporate media power—which defines the U.S. media system, with a small number of corporations controlling a large percentage of the content the media audiences consume—is harmful for democratic deliberation. While it is justifiable to protect against an oppressive government that censors opinions it finds disagreeable, positive First Amendment advocates argue that the lack of diversity and opportunities in the U.S. media system is likewise worrisome and should be addressed.

Scholars such as Pickard have proposed that the United States should encourage government efforts to support public service journalism, through mechanisms such as subsidies for an expanded public media system, tax incentives for media institutions struggling financially to transition into nonprofit status, and using public infrastructure to support producing local news content in communities. Others have suggested that embrace of a positive First Amendment would allow for some government regulation of social media platforms to ensure they promote healthy dialogue rather than facilitate the spread of misinformation.

In the 2017 decision *Packingham v. North Carolina*, the U.S. Supreme Court recognized the essential role the internet and social media platforms play in providing a modern-day public square. In striking down a state law that made it a crime for a registered sex offender simply to access a commercial social networking site, such as Facebook, the Supreme Court reflected a positive First Amendment approach as it articulated

why the law barring such access violated the First Amendment. “A fundamental principle of the First Amendment is that all persons have access to places where they can speak and listen, and then, after reflection, speak and listen once more,” Justice Anthony M. Kennedy wrote in the majority opinion. “By prohibiting sex offenders from using [social media] websites, North Carolina with one broad stroke bars access to what for many are the principal sources for knowing current events, checking ads for employment, speaking and listening in the modern public square, and otherwise exploring the vast realms of human thought and knowledge.”

POVERTY, COVERAGE OF

As poverty became a clearly recognized problem during the 20th century, journalists sought to describe and cover the problem, shedding light on its causes as well as those groups working to alleviate its impact. Coverage of poverty involves politics and economics but also sociology and crime, among other topics.

Definition

A challenge in covering poverty issues is the lack of consensus about defining what poverty is at any given time or place. Typically, poverty is related to economics and low-income levels. Many countries have a government-set “poverty line,” a baseline amount of total family income, and any family or household making less than this income is considered to be living “below the poverty line.”

However, there is agreement that poverty is also defined by cultural perceptions and, as Nobel Prize-winning economist Amartya Sen suggests, includes deprivation of political, economic, and social rights resulting in and exaggerated by public shame. Added to this conundrum is that the poor are often socially ostracized. The United Nations Development Program's (UNDP) Human Development Index adds life expectancy and education level to its dimensions of poverty.

Regardless of exact definition, the poverty line is a standard that shifts over time and place. The ways in which this line shifts and the criteria for the shifts are continuously at issue. More specifically, there is considerable argument about whether or not the criteria and shifts should automatically respond to the shifts in community living standards. In the United States, the federal poverty line as of late 2007 had not shifted (except for inflation) in four decades and has been considerably criticized.

Criticism of Coverage

There are many criticisms of media coverage of poverty, in both the United States and elsewhere. Rarely is poverty covered without strong sub-themes of race or gender. Although the majority of

people living in poverty in America are white (45% in 2007), most Americans believe that the poor are dominated by Blacks (although they only accounted for 24% in 2007) or Hispanics (in reality representing only 24% in 2007), in part as news coverage of the poor often highlights these groups. A 2007 Fairness & Accuracy In Reporting (FAIR) study of poverty reporting found that in a study of three major U.S. networks (CBS, NBC, and ABC), the racial representation of the 76 poor sources quoted (out of a total of 191 quoted sources) in the 58 aired stories were non-Latino whites, 39%; African Americans, 38%; and Latinos, 12%. While these percentages alone may not lead to misguided perceptions of the poor in the United States, the percentage of non-poor sources may have helped to exaggerate the stereotypes (whites, 79%; African Americans, 18%; Latinos, 0%).

The most frequent stories about poverty in many countries are focused on that suffered elsewhere with little coverage of their own, unless prompted by an event, political campaign, or crime statistics. A recurring criticism of mainstream news media coverage of poverty is that their reports create distance between those living in poverty and those not, by portraying those who are poor as intrinsically different. An example of this type of coverage includes stories highlighting drug use, alcoholism, or criminal activity of the poor. It is argued that this portrayed difference from the middle class perpetuates a feeling of either indifference about poverty or acceptance that poverty is undefeatable, that, as stated in Matthew 26:11 of the Bible (*For you always have the poor with you*) and as Fairness & Accuracy In Reporting (FAIR) titled its 2007 poverty report, it “will always be with us.”

The lack of poverty coverage in broadcast news is often attributed to advertisers’ distaste for depressing news stories surrounding product advertisements. Journalists often refer to the producers’ distaste for stories without a happy conclusion as discouraging more stories about poverty.

Elections

Stories about poverty or the poor tend to increase during political campaigns. However, the stories

often focus on politicians’ motives behind poverty policy proposals. Very few discuss the broader issues surrounding poverty and its causes such as income gaps, education, health care, social services, stereotypes, social stigmas, or welfare. There is also debate over the “deserving poor” (those who are working) and “undeserving poor” (those seen as unwilling to work), an issue that seldom enters news coverage. Furthermore, few news pieces, whether print or broadcast, use real individuals living in poverty as sources—and thus the public is often unaware of the human side of poverty.

Democratic presidential candidate John Edwards is credited with highlighting the issue of poverty in the 2008 presidential election. Although he lost his attempt to gain the Democratic nomination, his devotion to poverty elimination pressured his competitors Hillary Clinton and Barack Obama to focus their proposed policies on poverty. Edwards conducted a “poverty tour,” on which he took major U.S. daily newspaper editors or reporters to eight states along a three-day, 1,800-mile route, and visited factories, farms, health care clinics, and schools to talk to the country’s poorest inhabitants. As a result, each of those newspapers and the three weekly news magazines all published articles on poverty in America.

Natural Disasters

As with political campaigns, coverage of poverty is typically heightened after a major event, such as a natural disaster, or a social trend such as crime. Even so, while these events draw attention to the issues of poverty, they usually focus more on the actual events. When concern about the events passes, poverty discussions rarely remain in the news media. For example, during and immediately following Hurricane Katrina, which wiped out parts of New Orleans in 2005, poverty was frequently in the news as it related to the thousands seen as being left behind in the storm’s floodwaters, but as concern began to recede, poverty coverage dropped off again. This drop in poverty coverage took place despite the media’s renewed vow (first made after the 1992 Los Angeles riots) to increase their poverty coverage. Syracuse University reported in 2006 that its public opinion survey (of the same year) concluded that after

national news media increased poverty coverage following Hurricane Katrina, 52% of Americans polled felt that national income inequality was “a serious problem.” Despite this, poverty again fell off the national news agenda not long after.

Poverty and Crime

Poverty coverage also enters the news media after an act of crime. A series of riots in Los Angeles in 1992 received national attention and led journalists to vow to increase their coverage of poverty. Despite the promise, such coverage declined shortly after the riots. Often reports of crime revive poverty coverage in the news, though usually only because the crime involves those living in poverty. Once the crime news is reported, the underlying issue of poverty is often left untouched. For example, during a spike of violent attacks (over 140) on homeless people in 2007 across the United States, news media frequently focused their reports on the criminal actions, rather than the more complex issues of the underlying poverty that led to the crimes. Journalists argue this is because events and actions are much easier and less controversial to report than broader social or economic trends. Indeed, often the most thorough coverage of poverty appears in book-length analyses rather than in the periodical press.

Poverty Elsewhere

Most American coverage of poverty relates to those living in Third World countries. These reports typically are linked to stories of disease or famine—or immigration. Often the reports are heavily larded with government statistics more than stories from those living in such conditions. Such reports are often cited as increasing the emotional distance between those viewing or reading the report (and not living in poverty) and those actually existing in poverty. Evidence for such criticism is the frequency with which images and reports of Third World poverty are recalled in the minds of the U.S. public before images and reports of poverty closer to home.

The most common reports of Third World poverty are produced by nonprofit organizations, some religiously based, in an effort to raise awareness and increase sponsorship (through donations)

of a child or family living in poverty in a foreign country, typically Africa. During these reports, while statistics are heavily used, there is usually a significant effort to show the human side of poverty and develop an emotional connection. However, there is still a clear element of distance (geographical and cultural) involved.

Print Media Coverage

Articles about poverty increase during presidential election periods. Compared to 2004, the number of articles about poverty during the 2008 campaign more than doubled. More specifically, there were just over a thousand poverty news stories in American newspapers and news wires in 2004, and some 2,600 in 2008. During nonelection times, print media have increasingly included discussion of poverty in political pieces. However, criticisms of such pieces argue that the stories rarely quote the poor or tell their stories and that reporters in general are more concerned with the politicians’ motives or policy issues, do not offer causes or solutions to poverty, and continue to perpetuate a feeling of distance between the non-poor and the “other.”

Book-length journalistic pieces are often written on poverty and occasionally top bestseller lists. The popularity of books dealing with American poverty reinforces public opinion data finding that the public does indeed consider poverty a significant issue. For example, Barbara Ehrenreich’s *Nickel and Dimed: On (Not) Getting by in America* (2001) remained on *The New York Times* bestseller list for 2 years.

Electronic Media Coverage

Broadcast news reports rarely include stories about the poor. As with print, the numbers of reports increase during election periods, after natural disasters or crimes, and during the Christmas and Thanksgiving holidays. However, these reports rarely include discussion with poor individuals, focusing instead on experts or charity workers. The stories rarely address policy issues surrounding poverty or possible solutions; of those, it is even rarer that the poor offer the opinions. The majority of poverty stories, if the poor are included, portray general suffering. An

exception to this was two NBC stories (2005, 2006) during which residents of the Lower Ninth Ward in New Orleans shared their thoughts on the Hurricane Katrina recovery process.

Some attribute the lack of actual poor sources quoted in poverty coverage to the fact that the public/media relations firms do not represent the poor. The experts' corporate communications agents and resources foster the oversaturation of nonpoor expert sources.

Poverty stories are continually criticized for including overtones which perpetuate the "deserving"/"undeserving" poor dichotomy through the use of language such as "working poor" (with the criticism that these words imply that the nonworking poor are undeserving of sympathy or assistance). Frequently, stories about the poor highlight the elderly and veterans.

From September 2003 to October 2006, the three major U.S. news networks aired fewer than 60 stories about the poor or poverty (despite a 2005 U.S. Census reporting that 37 million Americans were living below the federal poverty line). Most of the stories rarely showed the poor, but rather relied more heavily on sources other than those living in poverty. Of the poor shown in the reports, African Americans were overrepresented compared to their proportion of American poor (38% shown/24% actual). Women were slightly underrepresented as poverty sources compared to the percentage of poor (46% shown/57% actual).

Often the more in-depth coverage of poverty airs on special programming. For example, PBS aired Roger Weisberg's documentary "Waging a Living" in 2006 as a part of its POV series, and ABC's 20/20 aired a special report "Waiting on the World to Change" in 2007.

Discussion of poverty is most often found online, primarily on nonprofit organizations' websites rather than those of major news outlets.

The Future

Many organizations recognize the absence of what they consider adequate and accurate coverage of poverty by journalists, and they have subsequently developed workshops to increase such coverage. An example is the partnership between

the Inter Press Service, an international news agency, and the UNDP. The goal of these workshops is to affect governmental policy through media generated awareness and pressure.

The Harry Chapin Media Awards (formerly World Hunger Media Awards) are presented to journalists who cover poverty, inequality, and development in newspapers, periodicals, radio, television, film, book, and photojournalism. Nikon is the exclusive sponsor of the awards ceremony and event.

These initiatives are meant to improve the quality of poverty coverage and race and gender representation of sources. Despite these programs, media watchdog reports, and other news media research organizations calling attention to the weaknesses in poverty coverage, doubts remain that any dramatic improvements in coverage will be realized in the near future.

PRESIDENTIAL FAMILIES, COVERAGE OF

Media coverage of presidential families fulfils a variety of journalistic and political communication needs. It responds to the public's thirst for insight into the human side of White House life, providing numerous opportunities for feature material that amuses as well as informs readers and viewers. It also speaks to the personal qualities of the president, displaying to what degree the nation's leader exhibits characteristics of exemplarity family life. Consequently, political concerns undergird this ever-present media spotlight. Are the president's family relationships as presented to the public a help or hindrance to the success of the incumbent's administration? Presidential communication is designed to picture them positively, whereas media coverage is concerned with questions of news judgment that often involve conflict and controversy.

The role of the president's spouse traditionally has engendered media attention. Although neither elected nor salaried, and not mentioned in the U.S. Constitution, the spouse increasingly has functioned as an arm of the presidency during the past century. To date spouses have been female and referred to as first ladies, but this is likely to change in the years ahead as women and gay candidates run for the nation's highest office. In terms of White House organizational charts, the spouse operates from the taxpayer-supported Office of the First Lady, which is outranked only by the Office of the Vice President and the Oval Office of the President.

This entry examines the importance of presidential family coverage in the United States, its early history, and some of the trends that have defined presidential family coverage in the 20th to 21st centuries.

Importance of Media Attention

While the White House budget does not contain a separate line item for the support of the Office of the First Lady, it constitutes a significant operation that has charge of the spouse's schedule, social engagements, and official duties assisting

the president. In that capacity, the U.S. Court of Appeals ruled in 1993 that the president's spouse can be constructed as a "federal officer or employee." Spousal activities therefore merit attention from journalists keeping watchful eyes on presidential administrations. In practice, media coverage of spouses has served as a benchmark that denotes appropriate spheres for wives and mothers in general. In line with changing societal expectations for women, first ladies have been depicted as national role models, judged for their expertise on fashion, entertaining and commitment to good causes, as well as their usefulness to their husbands and personal political skill. In a highly visible role as an advisor to President Bill Clinton, who was elected in 1992 and 1996, his wife, Hillary Rodham Clinton, gained experience that led to her own election to the U. S. Senate in 2000. She subsequently made history in 2016 when Democrats chose her as the first woman to be nominated by a major political party to run for president. Although she won the popular vote, she was defeated in the electoral college by Republican Donald J. Trump.

Unlike spouses, presidential children, in common with other presidential relatives, do not necessarily play a key role in White House coverage, although their position makes them newsworthy, particularly if they violate social norms. Generally, minor children receive little attention as they attend school and engage in age-appropriate pursuits. Grown children and presidential siblings fall under media scrutiny depending on how close they are to the administration. If they occupy key positions in the White House, as was the case with Ivanka Trump and her husband, Jared Kushner, both of whom were named unpaid senior advisors to President Trump, they receive as much, or more, media coverage than that given top officials. Underlying media interest in dealing with grown children and other presidential relatives is the question of their influence on actions taken by the chief executive.

Family relationships always have interested journalists as part of the story of the presidency. White House history offers several examples of family dynasties, dating back to the second President, John Adams, who was elected in 1796, followed by his son, John Quincy Adams, in 1824. Benjamin Harrison, who won election in 1888,

was the grandson of William Henry Harrison elected in 1840. Franklin D. Roosevelt, who served as president from 1933 to 1945, was the fifth cousin of Theodore Roosevelt, who became president in 1901. His niece, Eleanor Roosevelt, one of the most path-breaking first ladies, was Franklin's wife. In the 21st century, George W. Bush became president in 2001, little more than a decade after his father, George Herbert Walker Bush, was elected in 1988.

Early Coverage

In the first days of the United States, partisan newspapers used spouses as surrogates for attacks on their husbands. Rather than criticize President George Washington for allegedly behaving like a monarch, opposition editors berated his wife, Martha, for riding in a resplendent coach suitable for a queen. John Adams was accused of being dominated by his wife, Abigail. Enemies of President Thomas Jefferson, a widower, falsely claimed Dolley Madison, who sometimes served as Jefferson's hostess, had been his mistress to advance the prospects of her husband, James Madison. He followed Jefferson as president in 1809.

During the 19th century, some presidential wives avoided public attention on grounds of ill health. An exception was the high-spirited Julia Gardiner Tyler, who eloped with President John Tyler in 1844 after the death of his invalid wife, Letitia. Friendly with a journalist for the *New York Herald*, a leader of the new penny press that focused on human interest material, Julia delighted in reports calling her the "Lovely Lady Presidentress" and praising her social gatherings. By contrast, Jane Pierce, wife of President Franklin Pierce, stayed out of sight mourning the death of her son in 1852.

As printing technology advanced, publications used engravings and photographs to picture presidential families. When President James Buchanan, a bachelor elected in 1856, designated his niece, Harriet Lane, as his hostess, *Frank Leslie's Illustrated Newspaper* called her *first lady* in an initial use of the term. It soon became a synonym for wives of presidents who received increasing press attention, positive or negative. Mary Todd Lincoln, wife of Abraham Lincoln, generated unfavorable notice from publications that criticized

her extensive entertainment and efforts to redecorate the White House in the midst of the nation's Civil War.

After the war ended, enterprising women journalists established themselves as feature writers in Washington largely by focusing on presidential families. They lavished attention on the gala wedding of Nellie Grant, the daughter of President Ulysses S. Grant and his wife, Julie. When Lucy Hayes, the pious wife of President Rutherford B. Hayes, who followed Grant in 1877, declined to serve alcoholic beverages in the White House, the press nicknamed her "Lemonade Lucy," but generally commended her stand on temperance, one of the day's political issues.

Not surprisingly, the private White House marriage of President Grover Cleveland to his ward, Frances Folsom, who at 21 years of age was 28 years younger than Cleveland, drew massive press attention in 1886. Unscrupulous reporters tried to spy on the couple with binoculars as they honeymooned. Speculation on the couple's marriage eventually forced the youthful bride to authorize release of a letter politely refuting charges that her husband had mistreated her. Her diplomatic skill helped Cleveland surmount accusations of irregularities in his personal life, including an admission that he might have fathered a child out of wedlock years earlier.

With the advent of mass-circulation national publications like *Ladies' Home Journal* and *Good Housekeeping* aimed at women readers in the late 19th century, presidential families received idealized treatment as role models of American life. Pictures of presidential wives and children became predictable features of both magazines and newspaper women's pages. To accommodate the press, Caroline Harrison, the wife of President Benjamin Harrison, who defeated Cleveland in 1888, handed out publicity photographs of the Harrison grandchild, "Baby McKee," making him the most photographed child in the United States at the time.

Twentieth-Century Trends

The family of Theodore Roosevelt, who became president in 1901 following the assassination of William McKinley, recognized the growing importance of the Washington press corps and its thirst for news from the White House. President

Roosevelt instituted regular press briefings, while his wife, Edith, determined to stay aloof from journalists herself, hired the first White House social secretary. Her duties included facilitating coverage of the Roosevelt family with its six lively children. Alice Roosevelt, the oldest, refused to conform to expectations, capturing attention by smoking in public, then considered shocking for a respectable woman, and driving an open car. Asked about her antics, President Roosevelt amused the public by replying that he could run the country or control Alice, but that he could not do both.

As motion pictures and radio gained audiences, presidential families became popular subjects. When Warren G. Harding was elected president in 1920, his wife, Florence, posed for movie newsreels. Her successor, Grace Coolidge invited stars of stage, screen and radio to visit the White House, linking her taciturn husband, President Calvin Coolidge, to the 20th-century world of media that his successors and their families increasingly occupied.

The presidential couple with the longest stay in the White House, Franklin and Eleanor Roosevelt, who lived there from 1933 until 1945, took charge of their own media coverage. Both used the radio along with frequent press contacts to personally communicate with the public. Unlike her aunt Edith, Eleanor Roosevelt did not cut herself off from journalists, but set up White House press conferences for women reporters only. Overcoming fear that being first lady would confine her to social activities, Eleanor shattered precedent and continued her own career as a paid writer, broadcaster, and lecturer, which she had launched before Franklin Roosevelt's election as president in 1932. She advocated for the administration and earned money that she donated to charity.

Tirelessly traveling throughout the United States during the years of the Great Depression in the 1930s and then over the globe to visit troops during World War II, Eleanor Roosevelt gained headlines as no president's wife had done before her. Her syndicated newspaper column, "My Day," billed as a diary of her activities, offered her own report on White House life, picturing her husband at the dinner table and referring to her five children and their families. As a journalist herself, she wrote for women's magazines and published

books while first lady, urging women to be more involved in civic life.

After Eleanor Roosevelt's tenure, women reporters looked to first ladies as reliable sources of news, even if they had to strain to find stories about them. Roosevelt's immediate successor, Bess Truman, wife of President Harry S. Truman, disliked being a public figure and turned over some duties to her daughter, Margaret. Bess was followed by Mamie Eisenhower, who said she had "only one career and his name is Ike," referring to President Eisenhower. Journalists portrayed both women as representatives of Middle American family life.

Projection of Spousal Projects

The election of John F. Kennedy as president in 1960 propelled his wife, Jacqueline, into media stardom. His victory was credited in large measure to his mastery of television, which included projection of the large, photogenic Kennedy clan headed by his father, former ambassador Joseph P. Kennedy. The first president's wife to have an assistant formally known as a *press secretary*, Jackie, as she was affectionately known, fascinated the press with her taste in fashion and cultural affairs. Via color television, then a new phenomenon, she conducted a tour of the White House in 1962 to showcase her historic restoration of the mansion's furnishings.

After Kennedy's assassination in 1963, the dignified young widow, pictured with her small children, Carolyn and John, attracted worldwide news coverage. The media spotlight fell on John Kennedy's brother, Robert, who served as attorney general in the Kennedy administration. He became a leading contender for the Democratic presidential nomination before himself being assassinated in 1968.

In the footsteps of Jackie Kennedy, presidential wives, aided by press staffs, took on projects, usually noncontroversial, that displayed interests beyond social events. Lady Bird Johnson, wife of Lyndon Johnson, who succeeded Kennedy as president, championed the environment. Her activities, which included limiting highway billboards and planting wild flowers, were trivialized under the name of "beautification," since it was not considered appropriate for first ladies to be involved in

serious issues. President Richard Nixon's wife, Pat, tried to promote voluntarism. Her efforts floundered as reporters found her hesitant to speak out for fear of hurting her husband and the Nixon administration bogged down in the Watergate political scandal.

Betty Ford, whose husband, Gerald Ford, became president after Nixon resigned in 1974, won media acclaim for frank discussion of breast cancer. Her views on changing sexual mores hit a different note. When a television interviewer wanted to know how she would react if her teenage daughter, Susan, had an affair, Ford said she would not be surprised and called for open parent-child communication. Critics accused her of condoning immorality, but a later newspaper poll indicated a majority of Americans were not upset by her answer.

After the election of President Jimmy Carter in 1976, his wife, Rosalynn, who acted as his confidential advisor, emphasized the need for improved mental health legislation. She complained that her efforts received virtually no coverage, perhaps because by that period newspapers had eliminated women's pages in favor of style sections oriented to entertainment. Coverage of first ladies had been standard features of women's pages but they were mentioned less frequently in news sections, where President Carter's brother, Billy, attracted unfavorable attention. Journalists reported Billy, the owner of a gasoline station who was described as a Southern "good ol' boy," had received loans from the government of Libya, which was accused of terrorism, and owned large amounts of back taxes.

Continuation of Traditional Values

Even as women's roles expanded, the news media continued to picture presidential families in terms of traditional norms. Weddings of presidents' daughters while their fathers were in the White House enthralled readers and viewers. Both Luci Baines Johnson and Lynda Bird Johnson staged picture-book weddings in 1966 and 1967, respectively, during the Johnson administration. Television displayed Tricia Nixon's royal-like wedding in 1971. Her sister, Julie, had married David Eisenhower, the grandson of President Dwight W. Eisenhower, before her father's election.

Nancy Reagan, whose husband, Ronald, was elected president in 1980 as a proponent of family values, initially was dubbed "Queen Nancy" by journalists who claimed she was obsessed by clothes and had strained relations with her own children. Her media coverage improved after she launched a campaign, "Just Say No," aimed at eradicating drug use among youth. Her successor, Barbara Bush, wife of President George Herbert Walker Bush, adopted the cause of literacy and frequently was photographed reading to small children. In a similar vein, her daughter-in-law, Laura Bush, the wife of President George W. Bush and a former librarian, stressed reading and the importance of libraries after becoming first lady in 2001. When news accounts surfaced that her college-student twins, Barbara and Jenna, were cited for underage drinking, Laura objected vigorously, contending that a profit-driven media should not exploit presidential children.

Hillary Rodham Clinton, a lawyer and advocate for women's rights, garnered praise for being put in charge of health care by President Bill Clinton after his election in 1992, but soon encountered negative coverage. The failure of her plans resulted in a barrage of unfavorable news stories. She also figured prominently in news accounts concerning unproven allegations she had committed financial and legal improprieties before entering the White House. Ridiculed for changing hair styles and types of attire presumably in search of a favorable image, she rebounded in public favor in 1998 when she supported her husband during his impeachment for sexual relations with an intern, Monica Lewinsky. Gaining sympathy as a stereotypical wronged wife, Hillary went on to become the first woman to win the popular vote for president even though her opponent secured the Electoral College and thus the presidency.

The history-making election in 2008 of Democrat Barack Obama, the nation's first African American president, sparked media interest in both his extended and immediate family, which consisted of his wife, Michelle Robinson Obama, two school-age daughters, Malia Ann and Natasha (called *Sasha*) and Michelle's mother, Marian Robinson. Journalists interviewed numerous Obama relatives scattered over the globe, pointing out that Obama's deceased father, Barack Hussein Obama Sr., came from Kenya, and his American

mother, Ann Dunham, from Hawaii, where President Obama was born and grew up.

The news media recognized President Obama's often-expressed desire to be an attentive parent himself in view of the fact that his parents had divorced and he had had little contact with his own father. News stories pictured the Obamas as a close-knit family unit, noting the president had dinner daily with his family and assisted in coaching Sasha's school basketball team. When a communications director for a political opponent attacked Obama's daughters on social media for looking bored during a traditional White House ceremony at Thanksgiving, a public outcry forced the aide out of her job.

Off to a rough start in terms of her portrayal, Michelle Obama, a lawyer, emerged as a media celebrity, becoming an extraordinarily popular media figure. From a working-class neighborhood on Chicago's South Side, she had graduated from Princeton University and Harvard Law School and held a top job as a hospital administrator before her husband's presidential campaign. At first deemed a political liability for being "an angry black woman" too outspoken on racial issues, she quickly learned to describe herself simply as "Mrs. Mom."

Avoiding hard-edged comments on public issues, Michelle, the descendent of slaves, urged young minority women to follow her example and pursue an education. Planting a White House vegetable garden with children from public schools, she publicized the need for more nutritious school lunches. Employing television, women's magazines, and social media, she waged a campaign against childhood obesity called *Let's Move*, and supported an initiative named "Joining Forces" to reduce hardships faced by military families. According to a 2019 Gallup poll, she was the most-admired woman in the United States.

Different Dynamics

Coverage of the family of President Donald J. Trump, following his unexpected victory as a Republican in the 2016 presidential race, confronted the news media with a different set of dynamics than the Obamas had presented. With a public increasingly polarized between the Republican and Democratic parties and the growing use

of social media, the Trump family provided newsworthy material for both opponents and proponents of his administration. The family included first lady Melania Trump, the president's third wife, three grown children who were heavily involved in his business and political interests, a daughter recently graduated from college, and a young son.

The president maintained close ties to his oldest daughter, Ivanka, a wealthy writer and entrepreneur who marketed clothing and accessories, and her husband, Jared Kushner, a multimillionaire real estate developer, naming them both senior advisors. Their positions led to ongoing media scrutiny as President Trump's political opponents contended neither had relevant experience and that their private interests conflicted with public service. Journalists questioned whether Kushner had received necessary security clearances before being put in charge of major efforts including plans to broker peace in the Middle East. As White House innovations director, his broad portfolio, subject to continuing news coverage, included oversight of numerous programs as varied as criminal justice reform and a coordinated federal response to the coronavirus pandemic.

Ivanka Trump, like her older brother, Donald Jr. and her younger brother Eric, had grown up with New York tabloid headlines featuring their father's acrimonious breakup with their mother, Ivana. A key administration figure, Ivanka, the mother of three, exhibited a media-savvy style that highlighted her stylish wardrobe during her meetings with world leaders. As an advocate for women's issues, she pushed for paid family leave and other policies to advance women's economic empowerment. Donald Jr. and Eric, who ran the Trump organization's real estate operations, were featured in the news as businessmen attuned to their father's political interests. Both Donald Jr. and Kushner figured in media accounts of their presence during the 2016 election campaign at a meeting with a Russian lawyer. The meeting was investigated repeatedly during impeachment proceedings against President Trump.

In contrast to her older siblings, Tiffany Trump, the daughter of actress Marla Maples, whose marriage to President Trump had ended in divorce after 5 years, kept a low profile. A law student at Georgetown University in Washington, Tiffany

did not live at the White House. President Trump's teenage son, Barron, the child of Melania Trump, was rarely seen in the media.

Melania, a native of Slovenia 24 years younger than her husband, was accustomed to the public eye as a high-fashion model before her marriage, but had little experience in public speaking or political life prior to her husband's bid for the presidency. She rarely campaigned for him in 2016. Her appearance at the Republican national convention that year backfired when reporters pointed out large portions of her speech had been copied, apparently inadvertently by a speechwriter, from an address Michelle Obama had given in 2008. Sometimes described as press-shy, Melania rarely gave media interviews. She maintained silence when reports surfaced that her husband had been accused of sexual harassment and allegedly had paid hush money to an adult film actress to cover up an affair that occurred during the first year of the Trump's marriage.

When the first lady did speak out, she did not always offer the same message as her husband did to the public. Her signature project, "Be Best," a campaign to prevent online bullying of children, was portrayed by some in the news media as an ironic commentary on President Trump's personal use of the social media platform Twitter to attack his critics. To promote her program, she reportedly appeared more comfortable speaking to children than adults. In 2020, journalists noted that Melania was pictured wearing a face mask as part of her own consistent message on social media urging the public to take precautions against the spread of the coronavirus. President Trump declined to wear a mask himself.

Three years earlier the first lady condemned the actions of white nationalists in Charlottesville, Virginia, after a woman was killed during a violent demonstration to protest removal of Confederate statues. By contrast, President Trump initially did not repudiate the white supremacists. When he took action in 2017 to separate children from their parents in an attempt to curb illegal immigration, the first lady expressed her disapproval and made a trip to the Mexican border to visit the children. She startled observers by wearing an inexpensive jacket bearing the words "I REALLY DON'T CARE. DO U?" Columnists speculated widely on what message this was

intended to convey. Months later she told a television interviewer that she had meant to show disdain for the news media critical of the Trump administration.

Concluding Thoughts

As technology has changed, news of presidential families has evolved to include coverage in various media including print, photography, broadcasting, and internet. It is based on a perception that the public in a democracy is entitled to a broad range of information about its chosen leader. If the presidency belongs to the people, then the people as represented by the news media, rightfully can expect to be given insight into the president's family relationships as a way of allowing it to judge character and performance in office. Since the role of the president's spouse has developed over the years into an integral part of the presidency, journalists today see it as a vital part of White House coverage. Family members often are depicted in media coverage as satellites that can either enhance or detract from the performance of the president.

PRESIDENTIAL SCANDALS, COVERAGE OF

From the partisan press to the digital age, press coverage of presidential scandals has been constant watchdog of White House misconduct and corruption as a mainstay of American journalism. While the sensational elements and public desire for such coverage often distract from factual reporting of administration policies and accomplishments, the resulting historical record impacts a president's legacy. Presidential scandals involve personal misconduct or political corruption by a president or associates that attract media coverage and influence public opinion. This entry examines famous presidential scandals from the early 19th-century scandals that plagued Andrew Jackson to the multiple scandals that dominated the presidency of Donald Trump.

Andrew Jackson— An Adulterous Marriage?

In the election of 1828, supporters of John Quincy Adams attacked the people's favorite general Andrew Jackson, who lost to Adams in 1824, by resurrecting tales of his early relationship with his eventual wife Rachel Jackson. In a vicious war between party-owned and administration newspapers, what began as a stealthy smear campaign developed into a ruthless frontal assault of slander

and insinuations about husband and wife never before witnessed in American presidential politics. These attacks on Rachel ranged from portraying her as a bigamist, adulterous whore to a "dirty, black wench," with the amorous Jackson being accused of stealing another man's lawful wife.

Jackson met Rachel in Nashville in 1789, when she was married to Lewis Robards, but separated and living in her widowed mother's house. Even though abandoned by her husband, to get a divorce Rachel was required to travel to Richmond for a legislative act, but she did not. A relationship blossomed as Jackson escorted Rachel and her mother to Spanish-controlled Natchez; they eventually returned to Nashville to live as a married couple with no record of a wedding. Meanwhile, Jackson learned that Robards was seeking a divorce, which was eventually granted, and the couple were married in 1794. That was the version promoted by Jackson supporters, while the opposition insisted that the adulterous couple pretended to be married, while Rachel was still legally to Robards.

These rumors first surfaced in 1823 in anti-Jackson newspapers in Pennsylvania, Ohio and Washington, D.C., but the military hero was elected to the U.S. Senate the next year. *Cincinnati Gazette* and *Enquirer* editor Charles Hammond, a friend of Henry Clay, published his 1827 expose "General Jackson's Domestic Relations in Reference to His Fitness for the Presidency." These attacks were later serialized in the pamphlet "Truth's Advocate and Monthly Anti-Jackson Expositor" in order to deny Jackson the presidency on moral grounds. Hammond charged that Jackson had prevailed upon Rachel to desert Robards, "and live with himself in the character of a wife."

Originally published in the *Gazette*, various versions of these charges were published in dozens of anti-Jackson partisan and Adams administration newspapers across the country.

While Jackson never directly answered personal attacks about his marriage, military executions, slave trading, and his semi-literacy, he realized the value of influencing public opinion through the country's increasingly influential party press. Jackson's long-time friend John Overton organized a committee in Nashville to respond to the adulterous accusations. Rebutting the charges with such supporting evidence as

affidavits and depositions, the committee's report was published as a pamphlet "A Letter from the Jackson Committee of Nashville . . . Upon the Subject of Gen. Jackson's Marriage." Other Jackson supporters created stories about premarital relations between Adams and his wife.

Originally featured in the pro-Jackson Tennessee and Kentucky press, portions of the pamphlet were eventually published in numerous partisan newspapers around the nation. Among the editors of those pro-Jackson publications were Duff Green, Amos Kendall, Isaac Hill, Francis Blair, some later members of his "Kitchen Cabinet," who later helped President Jackson organize a network of partisan newspapers to promote his candidacies and policies. Rachel died at the Hermitage, the Jackson home, after Jackson defeated Adams in the popular and electoral vote. The grieving widowed president blamed the slanderous attacks in the national Republican press for causing her death.

Ulysses S. Grant— The Whiskey Ring and Credit Mobilier

Even though a president might not be responsible for scandals caused by others, the resulting fallout can impact his legacy long after he leaves the White House. During his two terms, Ulysses S. Grant experienced continuous press criticism due to several scandals involving numerous Cabinet members or presidential appointees, especially in the Whiskey Ring and Credit Mobilier scandals, even though some events occurred before his initial election.

Elected primarily for his heroic Civil War record, Grant's political inexperience contributed to an ineffective relationship with the press and lack of credible response to scandals caused by his appointees and family. As a result, Grant suffered as much or more abuse from the independent and partisan-leaning newspapers as any president to that time except for Abraham Lincoln and Andrew Johnson. His 8 years in the White House were among the most politically corrupt.

By Grant's election in 1868, the partisan press and administrative organs had been replaced by independently owned newspapers, despite many editorially favoring one party over another. The

rise of crusading advocacy and investigative reporting foreshadowed the Muckrakers in exposing political and business corruption, including those surrounding the trusting yet oblivious Grant, who later complained of unfair press abuse and slander.

In an investigation before Grant's reelection in 1872 over *New-York Tribune* founder-editor Horace Greeley, *The Sun* exposed Grant as "The King of Frauds" and announced his victory with the headline "Greeley Defeated: Four More Years of Fraud and Corruption." The Credit Mobilier scandal was originally reported by *The Sun*, then the national press. While building the Transcontinental Railroad during the Johnson Administration, the Union Pacific railroad set up Credit Mobilier as a dummy construction company. The same officers as the parent group earned lavish salaries funded by government payments. A Congressional investigation revealed that a House member distributed Credit Mobilier stock to several colleagues. The scandal also implicated Vice President Schuyler Colfax (a former Missouri newspaper founder), House Speaker James G. Blaine, and future president, then Congressman, James Garfield.

Since Lincoln levied tax on whiskey to finance the war, Congress had attempted to end fraud among Internal Revenue supervisors and Treasury Department agents, who approved fake brewing figures by distillers to avoid millions in government tax payments. An 1874 investigative story in the *St. Louis Globe-Democrat* exposed fraudulent distillers in St. Louis, Chicago, Milwaukee, Louisville, and other Midwest centers, who were tipped off about inspections by corrupt revenue agents. Investigations by federal prosecutors and indictments by St. Louis grand jury eventually entered Grant's inner circle, such as longtime aide General Orville Babcock, whom the president helped clear with an unprecedented 5-hour deposition. Notable newspapers, including *New York Tribune* and *Chicago Tribune*, praised the Ring's breakup, while implicating Grant's brother, son and brother-in-law, but they were never indicted.

In 1876, during Grant's final year in office, after the *New York Herald* called for an investigation of the War Department. The House committee found that Secretary of War William Belknap, a Civil War general, started taking bribes in 1870

for selling trading posts in Indian Territory. Having been impeached, Belknap resigned, but was tried, then acquitted. Grant's younger brother Orvil was also implicated in the scandal. Ironically, in the election of 1864, *Herald* editor James Gordon Bennett led the charge for a premature Grant presidential run.

Another 1876 scandal involved the president helping brother Orvil obtain four profitable Indian posts, but not with the sibling's illegal kickbacks. This scandal resulted in detailed reporting and editorial criticism of Grant by such leading newspapers as the *Herald*, the *Tribune*, *The New York Times*, *The Nation*, and the *Baltimore American*.

As for a third Grant term in 1875 and 1880, Democrat and independent publications, such as *The Nation*, the *World*, and the *Sun*, criticized the proposal and his two terms. Republican-leaning and independent newspapers, such as *The Washington Post*, the *Tribune* and *The New York Times* respected Grant's legacy with compassion for his failures, but wanted no third term.

Grover Cleveland— Abandoning His Illegitimate Child?

The sensational news reporting and editorializing concerning the private life of Grover Cleveland, particularly the 1884 campaign disclosure of his allegedly fathering an illegitimate child, demonstrated the impact of investigative journalism on the surrender of privacy by presidents, even before their election. Prior to Cleveland's nomination, the Republican Buffalo *Evening Telegraph* on July 21, published a front-page, three-column "investigation" titled "A Terrible Tale," later proven as distorted and fabricated in parts.

The story charged Cleveland with fathering and abandoning an illegitimate son with a widow, Maria Halpin, 10 years before. Offering no reply from the Democratic nominee, the story relied on local sources, particularly Buffalo pastor Dr. George H. Ball, a Republican supporter, who would later admit exaggerating certain details after being attacked in several Democratic-leaning newspapers outside the state.

After acknowledging the possibility of paternity, even though Halpin had been involved with other men, Cleveland telegraphed a message to his supporters, "Whatever you say, tell the truth.

While the candidate did not comment publicly on the charges, he told friends that he had "generously assumed the responsibility for the child to shield an intimate friend," as reported from an interview with a Cleveland staff member by the *Detroit Journal* (Lynch, 1932, pp. 200, 220).

Following investigations by several newspapers across New York State and the country, both Democratic and Republican, some details of the *Evening Telegraph's* exclusive scoop were proven distorted, some facts of the story were true. Other notable newspapers, both pro-Cleveland and independent, originally ignored the Cleveland scandal.

In New York City, publisher Charles Dana of *The Sun* used the revelation to defect from Cleveland and the Democratic Party, while Joseph Pulitzer of *The World*, attacked Dana and supported Cleveland. Democratic pro-Cleveland newspapers defending Cleveland included the *New York Herald* and the *Evening Post*, while the *New-York Tribune* and *The New York Times* supported James G. Blaine and the Republicans.

Reporting by newspapers from outside New York state included the Boston *Journal's* front-page, two-column, first-person investigation, on July 30, with interviews of Reverend Ball, asylum doctors, and Halpin's friends and neighbors. The story prompted criticism from such Boston Democratic newspapers as the *Herald*, *Evening Transcript*, and *Globe*.

Although Cleveland supporters rallied behind their candidate's forthright honesty, the revelation remained a campaign issue. In public rallies, supporters of Republican nominee James G. Blaine chanted "Ma! Ma! Where's my Pa?," while pushing baby carriages with dolls. Despite the scandal, Cleveland defeated Blaine in electoral votes 219-182, and 48.5% to 48.3% in the popular vote, a margin of about 24,000 votes. After Cleveland's victory, his supporters answered the Republican rally chant with the classic rejoinder, "Gone to the White House. Ha! Ha! Ha!"

Warren G. Harding—Teapot Dome

During his front-porch "Back to Normalcy" 1920 presidential campaign, Warren G. Harding was already defending himself from rumors of scandals, such as his womanizing and doubts over his

racial heritage, but defeated James Cox with 404 to 127 electoral votes and 60% of the popular vote. Before their political careers, both candidates were Ohio newspaper publishers.

In his personal life, Harding's prolific philandering was later well documented, including a 1927 memoir *The President's Daughter* by one mistress, who bore his illegitimate child.

Inside the White House, where illegal liquor freely flowed during Prohibition, the Harding administration's runaway corruption in the "Ohio Gang" involved Cabinet members, personal aides, agencies appointees, and the president himself.

Harding died suddenly in San Francisco on August 2, 1923, during a cross-country trip, as his emotional and physical health had deteriorated as his political scandals grew. At his death, Harding was a popular president, so the press and public mourned his unexpected passing. Thanks to the former publisher's amiable relations and regularly scheduled press conferences with newspaper reporters and editors, press coverage had been flattering, as scandal rumors had not yet implicated Harding.

Of several scandals during Harding's 29-month presidency exposed in the press and government investigations after his passing, the Teapot Dome scandal was considered the most explosive White House malfeasance to that time. After securing the transfer of oil reserves from the Navy Department, Interior Secretary Albert Falls profited from his no-bid leases and resulting bribes for three Naval reserves in Teapot Dome, Wyoming, and later served a prison term.

A six-inch front-page story in *The Wall Street Journal* on April 14, 1922, reported with unnamed "department sources," a lease to the Sinclair Oil Company. The story prophetically stated the contract "marks one of the greatest petroleum undertakings of the age and signalizes a notable departure on the part of the government in seeking partnerships with private capital for the working of government-owned resources."

Subsequent brief stories in the *Journal* and other newspapers, including *The New York Times*, the following week included a Senate call for an investigation, while Harding "would welcome" the leases and any probes. After his passing, daily national reporting of Senate investigations, a bipartisan commission and a special counsel

authorized by his innocent successor Calvin Coolidge, would tarnish the legacy of the trusting, but negligent Harding.

Richard M. Nixon—Watergate

By Richard M. Nixon's 1969 first-term inauguration, television had surpassed radio and print media as the major source of news for the American public.

Facing his first national political scandal, Nixon was nearly dropped from Dwight Eisenhower's 1952 ticket with charges of deception over a political slush fund. In an emotional 30-minute prime-time appearance known as the *Checkers* speech on 60 NBC-TV stations paid for by the Republican National Committee, the vice-presidential candidate defused the crisis, and served two terms. But during his presidency, live television news coverage would eventually lead to his downfall.

On June 17, 1972, Washington Metro Police arrested five burglars in the headquarters of the Democratic National Committee in the Watergate Hotel-Office complex. In covering their arraignment, *Washington Post* metro reporter Bob Woodward found links to the White House and CIA among the suspects.

Over the next six months in some 200 stories, Woodward and *Post* colleague Carl Bernstein linked the Watergate break-in to a web of clandestine operations by the Committee to Reelect the President to infiltrate and damage Democratic nominee Senator George McGovern. Earning a Pulitzer Prize, the *Post* exposed secret campaign fund and a trail of deception eventually leading to the Oval Office. Their reporting was later detailed in the best-selling book and feature film *All the President's Men*.

At first, Watergate was a local Washington police story. With better resources, manpower and reliable sources within the DC police and federal law enforcement, including FBI Associate Director Mark Felt, later revealed as "Deep Throat," the *Post* raced ahead of other news media. Some newspapers columnists and reporters were reluctant to credit the rival's scoops or did not believe the scope of unfolding corruption. Without credible sources willing to appear on camera, network television news struggled with the complicated investigative story.

CBS News anchor Walter Cronkite narrated a two-part series in late October 1972, which made Watergate a national story, despite White House denials and criticism of the news media. *The New York Times* published a five-part series by investigative legend Seymour Hersh in January 1973. With America's powerful newspapers, network television correspondents and international media pursuing the Watergate story, the administration's defenses began to unravel.

The Washington press corps wondered what did Nixon know and when did he know it? Initial evidence did not prove Nixon's prior knowledge, but he did authorize the coverup. Having easily won his second term, Nixon did not take any blame, but accepted responsibility for "people whose zeal exceeded their judgment" in a national television appearance on April 23, 1973. In several live press conferences and speeches to journalists, Nixon continually denied any prior knowledge, but exhaustive investigative reporting testimony by aides and audio tapes of Oval Office conversations later confirmed otherwise.

Over the next year, the Nixon presidency crumbled by his firing of high-ranking federal officials, a special prosecutor's investigation, convictions of key aides, and an adverse Supreme Court decision (reported on live television) over the Oval Office recordings. More than any other media coverage, however, the live television gavel-to-gavel Senate Select Committee hearings during the summer of 1973 turned public opinion into calls for impeachment.

During his presidency, Nixon attempted to use some two dozen live nationally televised speeches as public relations tools to distract the news agenda away from his scandals. Each of the three networks followed those speeches "instant analysis." In his final national television slot, Nixon announced his resignation.

William J. Clinton— An Intern Affair and an Impeachment

Even before William "Bill" Clinton secured the 1992 Democratic presidential nomination, his long-shot campaign was nearly derailed by sexual misconduct allegations during his two terms as Arkansas governor. The post-Watergate investigative news media were more eager to expose

scandals character flaws of national candidates and leaders than examine their domestic and foreign policies.

With "new media" creating internet news outlets and eliminating deadlines, the audiences clamored for instant news and sensational scandals. The eruption of "feeding frenzies" resulted in diminished fact-checking and anonymous sources replacing on-the-record credible sources. Unsubstantiated rumors becoming national stories, which later faded as nonstories without retractions.

While the political press ignored the sexual escapades of Franklin D. Roosevelt and John F. Kennedy during their administrations, media scrutiny of character issues and private lives in the 1990s went beyond newspapers, magazines, and TV exposes into best-selling books.

After announcing his candidacy, the relatively unknown candidate was confronted with allegations from singer Gennifer Flowers detailing their 12-year relationship. Appearing in a post-Super Bowl interview on CBS's *60 Minutes* with his wife, Hillary, Clinton denied the affair, while admitting to "causing pain" in their marriage. After her press conference featuring taped phone conversations with Clinton, Flowers traveled the national interview circuit, and later wrote two books. Meanwhile, the "Comeback Kid" finished second in the nation's primary, won the nomination, and defeated incumbent President George H. W. Bush.

The post-Watergate press would add the suffix "gate" to any potential political scandal, including two of three non-scandals during Clinton's first term. "Travelgate" involved possible 1993 improprieties in White House travel office, firing of several veteran staffers, and the suicide of Vince Foster, Hillary Clinton's former Little Rock law partner and deputy White House counsel. "Whitewater" involved possible wrongdoing in a 1978 real estate development venture in the Ozarks and a failed Arkansas savings and loan firm owned by a former Clinton aide. "Filegate" involved unauthorized receipt of some 300 confidential FBI files by low-level White House officials. While no charges resulted, the press—and lead investigator Kenneth Starr—seemed to think each inquiry merited serious investigative coverage.

In late 1993, press coverage of Clinton's sexual indiscretions erupted again when *The American Spectator* magazine featured interviews with two

Arkansas state troopers (“Troopergate”) on Clinton’s protective detail. The story also revealed his 1991 harassment of state employee named “Paula.” Investigative stories appeared the *Los Angeles Times* and *The Washington Post*, while Clinton’s accuser, Paula Jones, appeared in press conferences, interviews, and national TV shows. Jones filed a sexual harassment federal lawsuit against Clinton, which was dismissed in his favor, and then settled in her favor after a successful appeal. During a 1998 deposition, Clinton admitted the Flowers affair, but his “misleading testimony” about another affair would nearly end his presidency.

On January 17, 1998, a “world exclusive” on the Drudge Report website stated “Newsweek Kills Story on White House Intern” and “Blockbuster Report: 23-Year-Old Former White House Intern, Sex Relationship With President.” Matt Drudge reported new details, such as the identity of the intern as Monica Lewinsky, who made an affidavit in the Paula Jones case denying any relationship with Clinton. With growing speculation over possible investigation of criminal ramifications, Starr, *The Washington Post* and ABC News posted web stories about the intern on January 21, as the unprecedented media feeding frenzy exploded.

After publication of initial Lewinsky story, Hillary Clinton responded to her husband’s troubles as part of a “right-wing conspiracy” on NBC’s *Today*. Eleven days after Drudge’s story, Clinton stated in a live White House television speech that he never “had sexual relations with that woman, Miss Lewinsky.” But investigations by the media and Starr would prove otherwise, as detailed in the prosecutor’s pornographic report. After admitting the Lewinsky affair before a grand jury, Clinton acknowledged his inappropriate conduct to the nation in a live 4-minute televised speech.

With Clinton’s continuing denials and tainted deposition, the media frenzy pursued the first couple and Lewinsky. The tabloid press and upcoming 24-hour news channels, liberal-leaning CNN and conservative-devoted Fox, stoked every possible “breaking” lead, even those later proven false. While the president avoided press appearances, his administration attempted to distract the news agenda with domestic and foreign policy initiatives. Although the scandal lead to

his impeachment, the Senate acquitted the “profoundly sorry” president.

Donald J. Trump—Two Impeachments

No other American president arrived at or left the White House with as many personal and political scandals than Donald J. Trump. Even before his national celebrity status as the host of BC’s *The Apprentice*, Trump manipulated the New York City news media, particularly the tabloid newspapers to cultivate his image as a billionaire businessman and a flamboyant playboy between his three marriages. With that media attention also came media exposes of his personal life, business practices, and political aspirations, especially by *The New York Times*.

That media attention continued into his 2016 campaign, when Trump enjoyed more than two billion dollars of free airtime, which allowed him to run a fraction of his opponents’ advertising budget. With his adept use of social media throughout his presidency, particularly Facebook (35 million 2021 followers) and Twitter (88 million 2021 followers), Trump was able to drive the daily news cycle and set the news media agenda, until permanently banned from both shortly before leaving office.

With a free public medium unfiltered by news media or political norm, Trump could distract news media coverage from his scandals. Yet an antique medium—an audio tape—nearly derailed his campaign. On a 2005 bus ride with television host Billy Bush before an appearance on NBC’s *Access Hollywood*, Trump had been recorded boasting of his inappropriately touching women, even strangers. *The Washington Post* reported existence of tape on October 16, 2016, which was played repeatedly on the internet and television.

At first, Trump denied, but then admitted it was him on the tape. He called remarks “locker room banter, a private conversation that took place many years ago,” while referring to Bill Clinton. Later during fallout, “I apologize if anyone was offended.” An hour after tape’s release, WikiLeaks released 2,000 emails off personal account of Clinton campaign manager John Podesta, followed by 50,000 more hacked messages. Media and public attention shifted from the Trump tape

to Hillary Clinton and an old story over her private email server.

During the next four years, Trump chastised the news media as “the enemy of the people” and reporting fake news to create perhaps a toxic press-president relationship. Coverage of continuing scandals was ongoing, with conservative-leaning media, such as Fox News, defending Trump. Meanwhile, public trust of journalists seemed to decline as audiences consumed news from social media, late-night comedians, and pundits, which included the president’s supporters.

Press coverage of numerous scandals continued—sexual assault allegations, campaign finance violations, emolument clause questions, the Mueller report on Russian interference in the 2016 election, tax fraud investigations, two impeachments, security clearances, indictments, resignations, convictions, and pardons. Yet Trump maintained a stable approval rating throughout his presidency.

PRESIDENTS, COVERAGE OF

Informed by prevailing understandings of an independent Fourth Estate, the founding fathers of the United States demonstrated their initial commitment to freedom of the press through their words and actions, contending that newspapers held a special place in American culture and affirming that place through the protections afforded in the Bill of Rights. Armed with these protections, reporters covering U.S. presidents have done so with a range of symbiotic and adversarial approaches rooted in individual and collective relationships with the sitting president.

While espousing their commitment to a free press, when encountering adverse coverage, most U.S. presidents, regardless of party affiliation, have experienced negative feelings about news coverage as a whole, within specific outlets, or produced by an individual reporter. Until recently most presidents have not expressed those feelings publicly while in office, but some modern U.S. presidents have engaged in public attacks on individual reporters, news outlets, and the collective news media. This entry first discusses coverage of U.S. presidents beginning with the partisan press of the late 18th and early 19th centuries and by the commercial press that followed. It then looks at the late 19th and early 20th centuries, when White House reporters were increasingly seen as setting the national agenda and the public relations apparatus around the president grew more sophisticated. Finally, the entry discusses the

emergence of more adversarial coverage in presidential politics in the late 20th century and the development of crises of credibility in both U.S. presidential politics and the news media.

The Partisan Press and the Emerging Commercial Model, 1789–1897

As the United States minister to France, Thomas Jefferson may have best summed up the prevailing sentiment of the Founding Fathers toward newspapers when he said (as quoted in Teeter, et al., 2008, p. 79).

The basis of our government being the opinion of the people, the very first object should be to keep that right; and were it left to me to decide whether we should have government without newspapers, or newspapers without a government, I should not hesitate a moment to prefer the latter.

But, though the Founding Fathers expressed their commitment the freedom of the press through their words and deeds in the construction of the First Amendment, the first U.S. presidents, including George Washington, John Adams, and Thomas Jefferson, grew to despise adverse, sometimes vitriolic, coverage in the party-subsidized, partisan press. Federalist-leaning presidents Washington and Adams were often sharply attacked in Philip Freneau's Democratic-Republican *National Gazette* and later in Benjamin Franklin Bache's *Aurora General Advertiser*. In December 1796, for instance, Bache lashed out at Washington, writing: "If ever a nation has suffered from the improper influence of a man, the American nation has suffered from the influence of WASHINGTON. If ever a nation was deceived by a man, the American nation has been deceived by WASHINGTON. Let his conduct then be an example to future ages" (as quoted in Teeter, et al., 2008, p. 87).

Both privately and publicly, within the federalist-leaning *Gazette of the United States*, Washington and Adams condemned these partisan editorials designed to destroy their character and to discredit their administrations as lies. Moreover, amid the threat of war with France in 1797, Adams restricted First Amendment freedoms with the Alien & Sedition Acts. Under the Sedition Act, U.S. federal courts prosecuted more than 25

individuals, mostly editors of Republican-leaning newspapers, in opposition to the Adams administration before the measure expired in 1801.

Newspapers of this period offered what might be characterized today as fake news, a hybrid of misinformation, disinformation, and party propaganda. Newspaper publishers and editors circulated these partisan accounts in an attempt to gain a voice in the political process and to make a living in the era of party-subsidized newspapers, and party-subsidized partisan newspapers thrived. Moreover, by the 19th century, most politicians recognized the power of the press and sought to guarantee positive coverage for their party and themselves through a party-subsidized patronage system. In 1819, Congressional leaders erected such a system, which allowed the selection of a printer of choice without regard for the lowest bids to sustain the partisan newspaper model, and it remained in effect until 1846.

Based upon this partisan tradition, editors and reporters at emerging commercial newspapers in the middle and late decades of the 19th century focused most of their regular coverage on Congressional proceedings, but regularly shifted attention to the executive branch, particularly in election years and in times of war. Even with the move away from the party-subsidized news model and the decades-long development of the commercial news model, controversial U.S. presidential campaigns and elements of partisan political coverage have lingered into the 21st century.

Attempts to Manage Press Coverage, 1897–1960

At the end of the 19th century, professional news reporters employed at increasingly mass-circulating news outlets located in urban hubs began to shift their attention away from the halls of Congress to the new center of action in American politics, the White House. Recognizing the increasing reach of stories circulating through newswires, newspapers, and magazines, President William McKinley and his advisers extended their sophisticated strategic campaign communication once in the White House by formalizing the relationship between the president and Washington press. Moreover, in a moment of conflict that included a clash over news paradigms (i.e., detached, literary,

and activist brands of journalism) and amid a flood of sensational and fake news, news reporters increasingly recognized the president as a reliable news source and a regular news beat.

After the McKinley administration created the first official working space for news reporters at the White House, he and his successors attempted to shape the news coverage constructed by these increasingly important agenda-setters who informed and influenced public opinion. Moreover, amid increasing cries from the public for access to “information . . . not from a careless or reckless press, but from the president himself,” McKinley’s direct successor Theodore Roosevelt established the “public presidency” and erected a “bully pulpit” to influence the Washington press and their audiences (Roessner, 2020, p. 9). Thereafter, presidents increasingly relied upon emerging public relations and mass communication advisers to reach and mold public opinion of U.S. and global audiences directly through official news channels and indirectly through emerging new media technologies.

The White House press corps came to rely upon newsgathering opportunities, including the regular press conferences instituted by the administration of Woodrow Wilson in 1913. However, as presidential-press routines became more formalized in subsequent years, reporters increasingly challenged the slick, Hollywood-inspired public relations campaigns that emerged in the decade after the nation’s intensive propaganda campaign waged by George Creel’s Committee on Public Information during World War I.

By the middle of the 20th century, presidential contenders embraced the tools of showbiz politics and implemented them with relative success to generate positive news coverage and to establish a postwar age of consensus politics. For instance, Republican presidential candidate Dwight Eisenhower welcomed Hollywood film professionals and Madison Avenue advertising specialists into his inner circle of advisers, and they constructed an effective showbiz-inspired campaign that effectively synced Ike’s image and his message into spots that resonated with the American public.

A generation of “TV presidents,” including Eisenhower, John F. Kennedy, and Richard M. Nixon, engaged in a hybrid of showbiz politics and news management to release a controlled flow of news to elite reporters and their American

audiences. During this period, the White House press corps, comprised of an older generation of elite, establishment news reporters, and a younger generation of skeptical frontline reporters, would come to challenge official reports that did not align with empirical observations and to chafe at government secrecy and news management techniques.

Credibility Crisis in U.S. Presidential Politics and the News Media, 1960–Present

Although Kennedy is remembered for the positive press coverage that followed his efforts to court the working press, his administration came under sharp attack from emerging conservative media outlets, including the *National Review*. The magazine’s editor, William F. Buckley Jr., warned that Kennedy might pack the Federal Communications Commission with members of his own party and deploy the fairness doctrine to silence conservatives. Moreover, echoing the dean of Washington-based reporters Arthur Krock, the consensus-minded news pack attacked after they learned of government secrecy, misinformation, and news management surrounding the Cuban Missile Crisis.

The credibility crisis in U.S. presidential politics intensified after Kennedy’s assassination in 1963 and as U.S. involvement in Vietnam escalated under the subsequent administrations of presidents Lyndon B. Johnson and Nixon. Mutual distrust contributed to the deterioration of symbiotic relationships among the president and the press and the emergence of adversarial coverage amid enhanced news management and circumvention techniques. Despite their unique vantage point, the White House press corps was slow to expose the discrepancy between official statements of government sources and the lived reality on the ground in Vietnam; instead, a new generation of more skeptical reporters, including *New York Times* foreign reporter Neil Sheehan and CBS News war correspondent Morley Safer, made their U.S. and global audiences aware of the emerging credibility gap in the Johnson and Nixon administrations.

Amid these journalistic exposes about government secrecy and lies, critics from the right and the left raised concerns about the trustworthiness

of U.S. news. Conservative thinkers, such as Buckley and Phyllis Schlafly, had long warned that elite, establishment news reporters were serving as kingmakers in presidential politics, but their claims were amplified by leaders in the Nixon administration, particularly Vice President Spiro Agnew, who attacked news broadcasters as a “tiny, enclosed fraternity of privileged men elected by no one” and condemned “irresponsible” elite reporters at establishment companies, such as the *New York Times* and *Washington Post*, for their biased news coverage (as quoted in Roessner, 2020: 23). Attacks on journalistic credibility also came from inside the newsroom. In 1971, former *Time* and *Life* correspondent Edith Efron published *The News Twisters*, an expose supporting Agnew’s claims of biased networks based upon analysis of news coverage of the 1968 U.S. presidential general election campaign. Moreover, from the left, prominent reporters, such as *New York Times* veteran Tom Wicker, critiqued journalistic objectivity for leading to an overreliance on official sources. Dissatisfied with traditional legacy news outlets, a well-known circle of journalistic veterans launched (*MORE*) *Magazine*, a journalism review established to hold the news media accountable to uphold its commitment as the Fourth Estate.

In mid-June 1971, Nixon’s Attorney General John N. Mitchell issued a temporary restraining order against *The New York Times* to require it to cease its publication of what became known as the *Pentagon Papers*, which exposed government secrecy and disinformation surrounding the Vietnam conflict going back to the 1950s during the administration of President Harry S. Truman. The U.S. Supreme Court offered its landmark First Amendment decision 2 weeks later, ruling 6 to 3 to dissolve the injunction, thus establishing precedent against prior restraint. Still, Nixon continued his war against the group that he privately referred to as his enemy—the press—prompting North Carolina Senator Sam Ervin to launch a congressional subcommittee hearing on the freedom of the press in September 1971. After the Pentagon Papers incident, Nixon embraced every tool at his disposal, even illegal ones, to fight what he referred to as conspiratorial attacks from his perceived enemies. Amid his increasing paranoia, he authorized a series of corrupt acts and illegal

cover-ups surrounding the Watergate break-in scandal that contributed to his downfall.

With the Watergate scandal, it was again a younger generation of skeptical reporters, particularly the *Washington Post*’s Bob Woodward and Carl Bernstein, not the White House press corps, who uncovered presidential lies and corruption. Only after this initial journalistic groundwork did elite news reporters, including CBS News anchor Walter Cronkite, provide the consistent coverage of the unfolding scandal that pressured the Senate Watergate Committee to engage in the bipartisan congressional hearings that ultimately resulted in Nixon’s resignation in the face of almost certain impeachment. Though the journalists who covered the Watergate break-in scandal were mythologized in films, such as *All the President’s Men* (1976), the legacy of Vietnam and Watergate contributed to an increasingly adversarial relationship between the president and the press.

In the ensuing years, the White House press corps and other elite journalists focused on engaging in extensive probes of alleged presidential scandals, such as the Carter administration’s Lancegate, which centered on allegations that President Jimmy Carter’s Office of Management and Budget Director Bert Lance engaged in financial misconduct in his previous role at the National Bank of Georgia. Presidential administrations increasingly embraced techniques to manage the news media, while by the 1990s conservative politicians regularly attacked the credibility of the news media on 24/7 cable news networks.

During the 2016 presidential campaign cycle that took place in a divisive, hyper-partisan cultural climate, Republican presidential candidate Donald Trump, the former reality television star, gained a tremendous amount of “free media” coverage beginning well before the primaries through grassroots social media with controversial tweets that were amplified by news outlets. Like other successful candidates after the party nomination reforms of the early 1970s, Trump capitalized on positive media coverage of his early primary victories to create a bandwagon effect that effectively withstood establishment opposition and media scrutiny. Moreover, after securing the nomination, Trump survived more intense media scrutiny and adverse news coverage of regular gaffes and scandals by attacking what he characterized as a

biased news media. Meanwhile on social media there was a proliferation of stories tied to the election that were presented as factual but had no factual basis, most of them favoring Trump. Amid scandals and controversies that left some in his own party questioning his fitness for the presidency, some journalists engaged in editorial rebukes of Trump. But Trump's strategy of admonishing campaign reporters proved successful in further undermining the credibility of news reporting and seemed to energize his base, contributing to his victory on Election Day.

Though U.S. presidents traditionally have enjoyed a honeymoon phase with the news media, Trump was afforded no such reprieve from journalistic scrutiny. The adversarial relationships initiated on the campaign trail continued during Trump's transition into office and inauguration. According to the Pew Research Center, during the first 60 days of his presidency news coverage of Trump was twice as negative as that of his predecessors dating back to President Bill Clinton. Trump responded in a Nixonian fashion by severely limiting press access, offering just one press conference and an average of 12 press briefings a month in his first year in office, far fewer than his predecessors. Moreover, he often berated specific news outlets, such as CNN, and individual reporters, even going so far as to suspend the press credentials of CNN reporter Jim Acosta.

Although Gallup found Americans' trust in the news media rose during the first 2 years of the Trump administration after a record low in 2016, it fell again in 2019 and throughout those years was much lower among Republicans than Democrats. Moreover, according to research conducted by the Pew Research Center, continued tension and adversarial relationships among the president and news reporters not only hinder access to the news for millions of Americans, but also threaten to undermine U.S. democracy by lowering perceptions of journalistic credibility and neglecting more comprehensive coverage of the actions of the federal government.

PRESS AND GOVERNMENT RELATIONS

The development of news media is closely tied to the emergence of modern government. Indeed, news media have always been intimately tied to government and political institutions more generally; they are often considered a political institution, a kind of “fourth branch of government.” Early newspapers served to shape public opinion in the course of battles between and within states, to integrate citizens into developing administrative structures of the modern state, and to provide them with the information necessary to manage their interactions with those institutions.

The importance of the news media grew as popular participation in political life expanded, often through the extension of institutions of mass democratic politics, but also through authoritarian institutions for the mobilization of mass opinion. News media are tied to the state through a dense and complex network; much of their content focuses on the activities of government, and governments, for their part, often devote large amounts of attention and resources to their relations with news media. The nature of the connections between the press and government varies depending on the role of news media in a particular society—their economic basis, for example, and the culture of journalism that prevails within them—and also on the nature of political institutions—how centralized power is within them, and the extent to which they are governed by legal rules, for example. The relationship of the news media to government also varies with historical circumstances—the U.S. news media, for example, acted very differently in relation to government during and immediately following the Watergate scandal of the 1970s, when they often took an aggressive “watchdog” stance, than they did in the aftermath of the September 11, 2001 terrorist attacks, when they reverted to a more passive relationship.

There is a long history of political polemics about the relation between journalism and government, and a substantial body of scholarly research and theory on that relationship. This entry discusses theories of press–government relations, the functions of the state in relation to the press, and characterizations of the press’s role in

relation to government. It concludes by discussing variations in press–government relations in different types of government systems.

Theories of Press–Government Relations

A key distinction needs to be made between normative and empirical theories of journalism and government, that is, theories of what roles the state and media *should* play in relation to one another, and theories about what roles they *actually* play. The dominant normative theory across most of the modern world is derived from liberalism, as expressed in such classic early works as John Stuart Mill’s essay *On Liberty*, published in 1859. This conception emphasizes the need for a press independent of the state, which will provide the basis for the independent public opinion on which the legitimacy of democratic government is based. In its later formulations, this view is connected with the idea of the news media as a “watchdog” of the state, providing a counterweight to state power.

The polar opposite to liberal theory is what Fred S. Siebert, Theodore Peterson, and Wilbur Schramm called in their influential 1956 work *Four Theories of the Press* the authoritarian theory, in which the state is conceived as having essential responsibility for protecting the interest of society as a whole. The “oppositional” role of the press (so valued in much liberal theory) is consequently seen as socially destructive, and state control of the press or at least close cooperation between press and state are more valued than is press independence.

Authoritarian theory was dominant in an earlier era. One of the most developed versions was the communist theory of journalism as an apparatus for revolutionary transformation of society, in which the media were conceived as an integral part of the state rather than an institution apart from it. This model, in the evolved form in which it is found, especially, in China, remains the most coherently developed alternative to Western liberal models.

Within liberal political systems, some elements of authoritarian theory coexist, as for example with “national security,” where many argue that patriotism should prevail over the watchdog function of the press. There is also an important distinction in democratic systems between more

classical liberal systems such as the United States, where government intervention is seen as a barrier to press freedom, and systems where the government is assigned a more positive role in assuring the conditions under which press freedom can prosper. This is more typical of European societies with traditions of a strong welfare state, where institutions such as public service broadcasting and press subsidy systems are justified in these terms. France, Italy, and the Scandinavian countries, for example, have systems of press subsidies that are intended to keep alive a greater number and diversity of newspapers than the market would otherwise allow.

Functions of the State

The State plays many different roles in relation to the news media. These include:

Censor. In some systems, the government restricts media organizations from publishing or broadcasting certain material.

Owner. Public service broadcasting is one version of government-owned media, though such systems are often structured as relatively autonomous from government control; they are publicly owned rather than government owned. In other cases governments directly own or invest in media enterprises.

Funder. Government funding can take the form of direct subsidies, tax breaks, loans, government advertising, and sometimes forms of patronage such as jobs, contracts, and other payments to media owners or journalists.

Regulator. Broadcasting is almost always state-regulated. Forms of regulation range from restrictions on cigarette advertising to hate speech laws to shield laws that give journalists special rights to confidentiality

“Primary definer.” Governments play a role in providing the information and of interpretive frameworks relied on by journalists. They serve as an agenda-setter, providing cues about what is news and what is not.

News Media as a Fourth Branch of Government

Although liberal press theory emphasizes separation of media and government and even sees them as adversaries, research has often emphasized

their interdependence and the ways in which journalists and media have become an integral part of the governing process. The different roles of the state listed earlier is one illustration. Even in an open society like the United States, government has played an important role in subsidizing news media, which were seen as an essential element of democracy as well as a key lever of power. Subsidized postal rates, government jobs (e.g., postmaster, customs inspector), and printing contracts, for example, were crucial to the early growth of American newspapers.

The government as a primary definer of news also illustrates this interdependence. Research in Britain and the United States has shown the media in those countries rely just as heavily on government officials as news sources as do journalists in other countries (France, for example) where government intervenes much more as a regulator, funder, and owner of media. Theories of the news-making process have consistently emphasized the central role of government officials as sources, and the fact that journalists’ routines of newsgathering tie them closely to government officials, as, for example, in the “beat” system that organizes journalism around divisions of the government.

Government and media rely heavily on one another: government officials need the media in order to communicate with the mass public and often with other political actors, and journalists rely on government as a steady source of usable, newsworthy content. The tremendous resources governments often devote to servicing the media have sometimes been referred to as an “information subsidy,” as they make it easier and cheaper for journalists to cover the news. Journalists get privileged access to government officials. When the president of the United States travels on Air Force One, for example, he is normally accompanied not only by his top aides and other political leaders, but by journalists. Officials, in return, get privileged access to the news media, where their words, concerns, deeds, and faces regularly appear.

Lapdogs or Watchdogs

There are important debates about the balance of power between media and government and the character of the relationship between them. These can be summarized as a debate about whether the media are watchdogs, aggressively

scrutinizing government officials, or lapdogs, mostly colluding with or manipulated by them. Gadi Wolfsfeld distinguishes among three characterizations of the media's relations to government: "faithful servant," "semi-honest broker," and "advocate of the underdog." A variant of the latter, which sees the media as an adversary of government, often as an overly aggressive watchdog that hurts the public interest by undermining support for governing institutions and making it more difficult for officials to govern, became more common in the 1970s and 1980s. The media in many countries did shift in that period toward a more assertive stance toward government officials and more negative coverage of politicians and political authority with the growth of investigative journalism and "critical professionalism" in the 1970s.

At the other end of the spectrum, the best-known statement of the "faithful servant" perspective is Noam Chomsky and Edward Herman's propaganda model of media-government relations, which sees media as dominated by elites who hold wealth and power in society, and are able to use the media to "manufacture consent" in mass public opinion. Their view sees media as dominated not only by government—though they place heavy emphasis on the state—but also by business elites, and they see these two sets of actors as acting in harmony.

Journalists like to see themselves as honest brokers, covering politics in a way that gives fair representation to a wide range of actors, and playing the watchdog role in a responsible and essentially objective way. Wolfsfeld uses the term "semi-honest" broker because virtually all researchers would acknowledge that the media are affected at least to some degree by inequalities of wealth and power, and that some actors—including certainly government officials—will always have more access and influence than others. The bulk of research can be described as falling somewhere between the honest broker and faithful servant perspectives. This research views journalists and news organizations as independent actors, often genuinely committed to the watchdog and honest broker ideals, but at the same time recognizes that the newsmaking process is influenced by structures of power, and that government officials exercise central if not unlimited influence. This scholarship also sees the relation

between media and government as variable rather than constant, with news media sometimes acting like faithful servants, sometimes more like honest brokers, and sometimes—more rarely—like advocates of the underdog, depending on political circumstances.

The indexing theory holds that the range of views represented in the news will be "indexed" to the degree of debate among political elites, becoming wider when elites are divided and actively debating an issue and narrower when they are not. In some versions of this theory, the media not only reflect the varying degrees of elite debate, but their own role also shifts: they are more independent and assertive in gathering and interpreting the news when elites are divided. Robert Entman's hierarchy of influences theory is a related attempt to synthesize research on political communication, which attempts to show how the political role of the media shifts depending on a number of factors, including divisions among political elite, but also, in some cases, such factors as mobilizations by social movements and the cultural resonance of various interpretations with journalists and news audiences.

These theories apply to liberal systems with media that are relatively independent of government economically and organizationally. In other systems, censorship, dependence of media on government, or tight alliances between media owners and governing parties, will produce something much more consistently close to the faithful servant model. Scholars often refer to this as "media capture." The rise of populist movements in recent years has in many systems destabilized traditional relations between media and political elites and produced strong conflicts between established media and populist-led governments.

Variations in Press-Government Relations

Relations between the news media and government vary considerably from one political system to another. Differences between liberal and authoritarian systems and between systems in which government intervention in media markets varies have already been mentioned. One important distinction has to do with the degree of political parallelism in the news media, that is, the

degree to which news organizations and journalists have political alliances or allegiances. In some systems, media have clearly identifiable political orientations, report the news from the point of view of particular factions, and in some cases participate in the process of debate and negotiation among those factions. In other systems, media avoid particular partisan entanglements and present themselves to audiences as providers of neutral information to a nonaligned public. The effects of many forms of government intervention also varies considerably depending on the nature of governing institutions. Government subsidy to news organizations, for example, may have little effect on media independence in systems with clear and transparent rules for the allocation of subsidies, and great effect in systems where government funds can be used at the discretion of political authorities to reward or punish the media.

PRESS FREEDOM

Democracy advocate Freedom House defines press freedom as, “the ability of journalists to report freely on matters of public interest.” Under such conditions, the press is able to inform the public while providing a platform for the open exchange of information and ideas. However, since 2001, press freedom around the world has been in decline. With this decline, doing journalism has become more dangerous. This entry explains this decline and what it means to journalists and their ability to report in the interests of democracy.

Dying for Journalism

According to the Committee for the Protection of Journalists (CPJ), in the 28 years from 1992 to the start of 2020, 1,365 journalists had been murdered for their work around the world. Broadening the count to include *media workers*, and those who died on the job in circumstances for which the motives were not clear, the number climbs to 2,022, a rate of six per month. Countless more have been imprisoned, threatened, beaten, and intimidated simply for fulfilling their democratic duties, in holding the powerful to account on behalf of their readers and audiences.

A closer analysis shows that the numbers were relatively low through the late 1990s, before surging in 2004. Until 2019, the annual tally of dead remained close to 100, but then the figure suddenly drops to 51. As of 2020, it is too soon to say whether the fall was a statistical blip, but the graph overall reveals something important about the global trends in press freedom.

As this entry explains, one among other possible cause for the surge in the early 2000s may

be the 9/11 attacks on the United States by Al Qaeda, and the way many governments chose to respond with legislation that not only targeted the media but also undermined democratic institutions. The 9/11 attacks changed the nature of conflict from battles over tangible things, such as land or ethnicity, to a war over ideas. In that struggle for ideological dominance, the place where ideas are transmitted—the media—becomes a part of the battlefield. In that world, journalists are no longer merely observers to conflict; they are regarded by both sides as actors and foot soldiers responsible for propagating the ideology of *the enemy*. One logical response from governments is to pass national security legislation that either explicitly or implicitly regards information as a weapon of war, which needs to be controlled and directed in support of the aims of the state. The tools and methods of control have since expanded to what has been called *lawfare*—a broader suite of legislative assaults on independent journalism, but the net effect is the same.

By simply reporting on and quoting one side or the other, journalists have become regarded as legitimate targets in a struggle for control not so much of physical land, but political and intellectual territory. The CPJ's statistics and the lived experience of hundreds of journalists show this is not just an academic theory, but a painful and bloody reality.

Lawfare and Restricting Press Freedom

The challenge for journalists covering conflict has always been to adhere to their professional obligations to provide fair and accurate coverage in the face of extraordinary pressures from the state to support its aims in war. Under normal circumstances, the media would critically analyze legislation, bringing in specialists, sceptics, and outright opponents of the proposals, to thrash out the consequences and develop a settled majority view. But the 9/11 attacks elevated the overriding importance of security to such an extent, that anyone seriously challenging the government's policies could themselves be attacked as supporters of terrorism.

University of California academic Douglas Kellner (2008) pointed out that “war correspondents must mediate between the conflicting ideals of journalism, an often pro-military and pro-war public, pressures from their corporate managers, and the frequently propagandistic and censoring efforts of the state and military” (p. 297). Those pressures can become impossible to resist, particularly when journalists themselves are drawn in and become part of the narrative and active supporters of the government rather than critical independent observers and reporters. As Kellner's 2008 study concluded, “the major story of U.S. journalism and the mainstream corporate media in the reporting of two Bush administration wars is largely a shameful one” (p. 325).

Much of the media's complicity that Kellner described, helped create an environment that enabled legislation, which has in turn severely limited press freedom in the decades since 9/11. The pro-democracy organization Freedom House alarmingly titled its 2019 report, “Global Press Freedom in Peril” and said, “the fundamental right to seek and disseminate information through an independent press is under attack, and part of the assault has come from an unexpected source. Elected leaders in many democracies, who should be press freedom's staunchest defenders, have made explicit attempts to silence critical media voices and strengthen outlets that serve up favourable coverage.”

Freedom House makes it clear that the assault on press freedom has broadened to include what is known as *lawfare*—the use of a raft of legal tools such as tax laws, ownership laws, regulation, and licencing—to further tighten government controls over media messaging.

To appreciate how far things have moved in the years since 9/11, it is worth recalling what the world was like before then, and in particular, how it worked for journalists.

Most of the casualties on the CPJ's list from the early 1990s were victims of three particularly savage civil wars in the former Yugoslavia, Rwanda, and Algeria. In just 1 year—1994—21 journalists were killed in Rwanda. Between 1992 and 1995, 30 lost their lives in the former Yugoslavia. In Algeria, the number killed in the 4 years between

1992 and 1996 was 58. In the vast majority of the cases in Rwanda and Yugoslavia, the victims died because of their ethnicity; the fact that they were journalists was incidental—they would likely have been killed in the ethnic conflict regardless of their profession. In case of Algeria, they were trapped in the ideological crossfire between Islamists and the government.

While radical Islamists have often had a difficult relationship with reporters, history shows that conflict is not inevitable. Through most of the 1980s, journalists worked relatively freely with Mujahedin factions (Islamic *holy warriors*) in their war to drive Soviet forces out of Afghanistan. Once the Soviets had left, Western reporters continued to cover both the civil war between rival Mujahedin militias and the emergence of the newest force seeking to win control of the country—the Taliban.

The same was true of journalists working in the Gaza Strip, with the Islamist group Hamas in control, and in Lebanon with Hezbollah the dominant group. Inevitably some journalists were killed, but they tended to be casualties because they were working in an inherently dangerous environment or kidnapped simply because they were Westerners with employers who their captors believed would pay large ransoms. In very few cases on the CPJ's list were journalists targeted simply because of their profession.

That changed with 9/11. On September 20, 2001, U.S. president George W. Bush stood before a special joint session of Congress and declared the *war on terror*. He then went on to say, “either you are with us or you are with the terrorists.” As a phrase, the war on terror became a powerful framing mechanism that shaped the way many journalists and their readers and audiences came to understand the conflict and those who were involved in it. It also effectively removed the idea of neutrality. It became impossible to do as reporters had done through the 1990s in Afghanistan, for example, crossing the physical and ideological frontlines in an effort to understand what was driving those involved in the fighting. On November 13, 2001, soon after Al Jazeera obtained the first interview with Osama Bin Laden after the Bush administration accused him of masterminding the attacks, a U.S. guided missile landed on the

news organization's Kabul bureau. At the time, the U.S. military said it had targeted a *known Al Qaeda facility*.

On November 19, one of the Taliban's units ambushed a convoy that was moving between Jalalabad in the east of Kabul, toward the capital. The convoy included four journalists—Spanish reporter Julio Fuentes from *El Mundo*, Afghan photographer Azizullah Haidar and Australian cameraman Harry Burton who were both from Reuters, and the Italian journalist Maria Grazia Cutuli from *Corriere della Sera*. The gunmen released all those in the convoy apart from the journalists; they took the four journalists into the hills outside the town of Sarobi and executed them. The killers were eventually captured, and during their trial, they admitted being involved but said they were only carrying out orders from their superiors to go after journalists. It was the first explicit attack by the Taliban on journalists, not because of their nationality or religious faith, or because of their reporting (they were on-route to the story and had not yet started working), but because of their profession.

Those two events—the bombing of Al Jazeera's Kabul bureau and the murder of the four journalists in Sarobi—indicated that the environment for the media in the war on terror had profoundly shifted. Since then, militant Islamists have continued to target journalists in Iraq, Syria, Afghanistan, and Somalia, as well as a magazine in Paris, while governments have seized the opportunity to give themselves extraordinary wartime powers that either directly or indirectly restricted press freedom.

National Security and Press Freedom

Since it started tracking the numbers of journalists behind bars, the CPJ has also been monitoring their charges. Of the 248 in prison around the world at the end of 2019, 39 were facing what might be described as *traditional* crimes of journalism: defamation, violating censorship laws, or publishing ethnic or religious insults. Fifty-four had been locked up without charge. But 165—roughly two thirds of the total—were being held on what the CPJ broadly defines as *anti-state*

charges, including charges such as sedition, treason, and terrorism. As a means of comparison, in the year 2000, only 27 journalists had been imprisoned around the world, half of them on anti-state charges.

Those numbers suggest that governments increasingly see journalists as dangerous, particularly when it comes to threatening the state. In 2019, the country that has imprisoned the most reporters was China, with 48 behind bars. Of those, 34 are there on anti-state charges; the vast majority are Uighurs who had been covering the government's crackdown on what it describes as Islamist terrorism.

Turkey was in second place. All but one of the 47 in its prisons were facing anti-state charges. The numbers in Turkey's prisons increased in 2016, in the aftermath of a failed military coup. The government accused the exiled Islamic preacher Fethullah Gülen of orchestrating the coup and started arresting anybody suspected of supporting it. Since then, most of those journalists have also been accused of terrorism-related offences. At least 35 journalists were arrested in 2017 as a part of what become known as the *Bylock trial*, in which thousands of people were caught allegedly using an obscure smartphone app that enabled encrypted communications. The government believed that use of the app was evidence of association with the Gülenists and therefore involved in a terrorist conspiracy to overthrow the government. Egypt and Saudi Arabia tie for third place, with 26 journalists each.

The issue of jailing reporters is not limited to authoritarian regimes seeking to crack down on media criticism. The United States has its protections for press freedom and freedom of speech enshrined in the First Amendment to the U.S. Constitution, yet it has also seen an increase in the use of the law to go after journalists and their sources. Press freedom advocates in the United States have pointed to the Obama administration for using the Espionage Act of 1917 in particular as a basis for prosecution. Previous administrations used the act to prosecute anti-war protesters and those accused of spying, but only one person was charged with leaking to a news organization: Dan Ellsberg who in 1971 passed the so-called Pentagon Papers to *The Washington Post*. Although the precise numbers are difficult to confirm because of variations in the way the cases are

counted, it has been reported that the Obama administration used the Espionage Act at least as often as all previous administrations combined. In the majority of these cases, the Espionage Act was the basis for charges against journalists or their sources who had been exposing politically embarrassing information.

In a CPJ report titled *The Obama Administration and the Press*, its author, former *Washington Post* Executive Editor Leonard Downie Jr. declared, "The administration's war on leaks and other efforts to control information are the most aggressive I've seen since the Nixon administration." Another journalist quoted in the report, *The New York Times*' national security correspondent David Sanger, said, "this is the most closed, control freak administration I've ever covered." Despite expectations, the Donald Trump administration was not as aggressive in using the Espionage Act or other legislative tools as its predecessor, but press freedom advocates have accused President Trump of creating a hostile atmosphere nonetheless. He regularly described the press as *enemies of the people*, denigrated journalists and news organizations he regarded as unsupportive, and generally besmirched the integrity of the media. The situation deteriorated during the 2020 Black Lives Matter protests that erupted across the United States in the wake of the police killing of George Floyd in Minneapolis. The U.S. Press Freedom Tracker monitors aggressions aimed at journalists, and through the protests, they counted more than 600 incidents, mostly by security agencies who appeared to treat the media as hostile targets rather than legitimate observers.

Clearly not all news organizations have behaved honorably, but in another report, *The Trump Administration and the Media*, the CPJ argued that attacks on the credibility of the press not only undermined public faith in the media and therefore damaged U.S. democracy but also endangered press freedom around the world. According to the report, authoritarian leaders have used *fake news* to justify restricting press freedom, and in the process, many of them praised Trump's rhetoric as encouragement. University of North Carolina law professor David Ardina told the CPJ, "his caustic rhetoric and continuing attacks on journalists are echoing around the world . . . In other countries, they're thinking, 'If the U.S. does not value

independent journalism, why should we have it?' It's diminishing journalism around the world."

Australia is another democracy often hailed for its democratic credentials, yet it has become a global leader in national security legislation. In 2018, the union that represents journalists, the Media Entertainment and Arts Alliance (MEAA), published a report titled *Criminalising Journalism*. The report detailed the way many of those laws either directly or indirectly limit the ability of journalists to do their jobs in holding the powerful to account. In his foreword to the report, the MEAA chief executive Paul Murphy wrote, "with legislation being drafted offering 20 years jail for journalists, Australia has consciously wandered into the arena populated by serial press freedom abusers. Countries like Egypt, Turkey, China, Myanmar and Cambodia that lockup journalists who disclose what their governments are up to" (MEAA, 2018, p. 4). The following year, the Australian Federal Police raided journalists from two news organizations on consecutive days, searching for evidence of the sources of leaked confidential documents. The raids triggering widespread public outrage and two parliamentary inquiries into press freedom, but as of September 2020, no substantial legislative reform.

Globally, the restrictions on press freedom have broadened to include legislative tools, such as tax and ownership laws, media licensing, regulation and accreditation, and the use of government advertising dollars to apply pressure to unfriendly media organizations or specific journalists. In the Philippines, award-winning former CNN correspondent Maria Ressa has become the target of the government's anger because of the critical reporting by Rappler, the news site she founded. Ressa faced 11 separate legal indictments with sentences totaling more than 100 years in prison. Those charges included allegedly breaking tax laws, having foreign owners, and cyber-libel (criminal libel committed online). Ressa used the term *lawfare* to describe the way the government has weaponised the law against uncomfortable reporting. But the pro-democracy group Freedom House believes media freedom has steadily deteriorated around the world over the decade to 2020, increasingly driven by populist leaders with new forms of repression taking hold in both open societies and authoritarian states alike.

Concluding Thoughts

In its report on the state of press freedom in 2019, Freedom House said, "elected leaders in many democracies, who should be press freedom's staunchest defenders, have made explicit attempts to silence critical media voices and strengthen outlets that serve up favourable coverage. The trend is linked to a global decline in democracy itself: The erosion of press freedom is both a symptom of and a contributor to the breakdown of other democratic institutions and principles, a fact that makes it especially alarming."

Ultimately, if the first responsibility of any democracy is to protect the safety and security of its people, it makes sense to support the foundations of the system that delivered that security in the first place. Press freedom is widely accepted as one of those foundations.

PRESS POOLS

The term *press pools* is a reference to journalists working as a group, rather than in the traditional mode of competing with one another as reporters and employees of a particular news outlet. This occurs when a professional agency enlists journalists from several news organizations to share reporting content or location advantage. Reporters in the pool are expected to supply detailed notes and to file reports that are shared freely with all members of the pool who may not have been selected for inclusion at the event for coverage.

Press pools are sometimes the result of a government declaration in order to organize reporters and their newsgathering at a particular event or location. Press pools are also commonly used by public figures or large organizations such as international companies or leagues to efficiently distribute information. The term is often replaced now with the more inclusive *media pools* which accounts for the shift in news formats from paper-based print to audio and image content across digital platforms.

This entry describes the evolution of press pools and discusses the effects that pooling has had on news content and public opinion. The entry begins by discussing the reports sent home during the Roman Empire in western Europe before focusing on pooling practices of the U.S. news media in the 19th century and beyond.

Early Pooling of Reports

News reports in a written form that circulated, or were posted for public consumption, date to at least the first century BCE. The *Acta Diurna*

(Daily Events) reported significant events around the Roman Empire and provided a record or announcement of births, deaths, and marriages. The publication was a collection of news reports sent from the provinces as well as official notifications from government and was considered required reading for Roman citizens. The efficiency of collecting news into a single fixed issue and distributing or posting it for mass consumption was not lost on the citizenship of such a vast empire. Individuals recounted in letters and other kinds of records that they read specific reports in the *Acta Diurna* and relied on the contents for knowledge about their shared world.

With the development of a mechanized printing press, collected news was distributed in ever wider regions and the reports were gathered from many sources. Pooling of content was often through a post office or general publisher who had access to correspondents who were far-flung and well-informed. As regularly published newspapers became a part of advancing societies, the reporters were more organized and identifiable to establish authoritative content. There was the use of *nom de plume* when a reporter was concerned about retribution for news content, but many reports identified sources for information so that readers at least understood whether to believe the story.

Printing Press Era Pooling

Once newspapers became regularly issued and published by established news organizations, reporters supplied content that suited the publishers' and subscribers' interests. As a selling point for subscriptions, reporters were urged to provide the most current and reliable reports. The need for a constant flow of news reports spurred entrepreneurs to employ journalists and create newsgathering organizations such as the Associated Press, Reuters, and United Press International that collected news and supplied publishers with content. The development of the telegraph aided in news collection and distribution speed over long distances.

Press pooling—that is, selected journalists providing reports for an entire group of reporters who were working for several news organizations—took several forms. *Press conferences*, for example, where a source of information—a public official,

entertainer, or social personality—delivered at once the subject of a report to many journalists without giving interviews to individual reporters. This is one means of pooling the journalists and conserving the effort of relaying information. Press conferences were held, sometimes lavishly and with much anticipation, by government officials, the Hollywood entertainment industry, and anyone else with a public following in the days before social media. Another use of press pooling was developed by the news organizations that wanted access, equally and efficiently, to regular news sources. These pools are sometimes referred to as the *press corps* and are found in environments where news events and sources are habitually providing content. Reporters assigned to particular officials or agencies even had offices or locations dedicated for their reporting activities.

These pooling structures benefited the news sources because they limited the time necessary to interact with journalists. The pooling also benefited the journalists because everyone got the same information at the same time, requiring less time for each reporter to gather particular facts or statements. Journalists were free, then, to spend more time working on other aspects of their reports, such as gathering information outside the pool resources, or writing their stories. This pooling structure can lead to what is referred to as *pack journalism*, when reporting practiced by reporters in a group becomes uniform. Sources of news have also learned to use press pooling to their advantage. Pooled reporters could be uniformly misled with false reports or misdirected by information that was provided without substantiation. The timing of reports could also be managed by sources who wanted to delay information or advance speculation to benefit a particular stance or point of view.

Government Restrictions on Reporting

During times of social conflict, particularly wars and civil unrest, governments learned to manage journalists with varying degrees of success. Notably, in the United States, the federal government organized press pools for reporters covering offshore wars in a variety of ways. These efforts included limiting journalists' access to military activities, formally pooling with credentials and

dedicated work areas, to embedding reporters with specific military units or offices.

In the early years of the 20th century into the late 1960s and the Vietnam War, U.S. journalists who were reporting on wars from the frontlines were encouraged to be good citizens about the details and timing of what they relayed about military activity. Censorship was imposed by government agents as reports were intercepted and taken from messengers or deleted from field reports. And there were self-imposed rules applied by news organizations that feared that laws would be enacted to curtail freedom of the press if editors did a poor job of screening news content.

During the latter part of the century, the improvements in media reporting and communication equipment substantially shortened the timeframe for filing and distributing reports. The Vietnam War was reported so quickly by journalists at the front to the U.S. nightly news broadcasts that the reporters and editors hardly had time to think about the implications of their stories. The military, in response to so little filtering of the news, formalized the reporter credentialing process and imposed broad restrictions on what could be reported from war zones, beginning with U.S. interventions in Central America, Africa, and the Middle East in the 1980s. The restrictions ranged from a 1983 complete ban of media during the U.S. military intervention in Grenada and a 1986 shutdown of media reporting on the military operation in Libya. Following an internal report by Ret. General Winant Sidle, press pools were organized by the U.S. military for 1989 operations in Panama, 1990 in the Persian Gulf, and in the 1992 Somalia deployments. Later, the 1993 peacekeeping efforts in Bosnia-Herzegovina and the 1994 Haiti intervention both proved more difficult to enforce pooling strategies because the military activities were not as formal.

News organizations loudly decried the confinement of reporters away from the battlefields. Coast to coast, opinion writers posted scathing editorials, and reporters protested during press conferences with military officials when the news blackout occurred during the landing in Grenada and again in Libya. After the recommendations contained in the Sidle Report (1984) became known beyond the Pentagon, embedding of reporters was adopted by the U.S. military as a

way of controlling the news sent home from the Persian Gulf operations. Embedding also reduced the antagonism of the news organizations. In this new press pooling template, reporters were allowed access to offshore operations but were restricted to their specifically assigned military units. They were also instructed, with guidelines from the military, that providing any detail about troop movement, size, or activity might inform the opposing side in the conflict. Reporters were required to agree to, and abide by, the guidelines or they would be denied credentials that allowed them to report from the locations of military activity.

These restrictions of press pools had a deep effect on the kinds of news that was distributed in the United States, and research suggests it has also affected public opinion about military conflicts. For example, during the 1982 U.S. Marines deployment to Lebanon, before media pooling was in effect, only 35% of respondents to a public opinion poll said it was the right thing to do. But the next year, after the 1983 Grenada invasion and reporter blackout, 69% of poll respondents said it was the right thing to do.

Modern Press Pools

As communication technology evolved in the 21st century, the need for credentialed journalists on the scene of specific events has diminished. Reporters with varying skills are more often available as freelancers for news organizations to hire on the spur of the moment. News organizations have blended staff reports across communication platforms, so that fewer reporters are required at any given location or for specialized events.

News reports can be filed seamlessly using digital equipment and Internet connections, so that anyone with a portable computer or smartphone can transmit news anywhere that satellites serve. News consumers are also less reliant on a few news sources and can instead browse the World Wide Web for information at will. These factors—worldwide digital communication, and the ubiquity of search tools—have reduced the efficiency and usefulness of press pools as a means of controlling information gathering,

limiting or broadening information distribution, and affecting news media content.

PRINTING

Printing is the reproduction of text and images in quantity on paper. Modern printing has become highly sophisticated and more digital in nature and has been transformed from art to science. New digital printing processes combine the use of advanced premedia systems (preparation of content for printing or publishing), lasers, plates,

presses, inks, papers, electronic controls, and digital imaging and printing systems. This entry examines printing's origins and summarizes different types of printing, including lithography, digital imaging, and ink-based processes, including but not limited to offset lithography, letterpress, and screen printing.

Origins

Printing from movable (or exchangeable) type appeared in China and Korea in the 11th century. The oldest known printed rather than manuscript text was printed from clay in Korea in 1397 BCE. In 1440, Johannes Gutenberg of Mainz (Germany) introduced printing with ink on paper to the Western world with his invention of movable cast metal type mounted on a converted wine press. Until Gutenberg's invention, all books in the West were laboriously handwritten or copied by scribes.

Changes in press construction evolved slowly until the first all-metal press was built in England by the Earl of Stanhope early in the 19th century. Expanded use of printing was spurred by the growth of book and newspaper publishing and the need to produce more copies of publications faster. During the Industrial Revolution, the job (or platen) press and the cylinder press were developed. The first successful cylinder press, in which a rotating cylinder was used to press the paper against a flat bed of raised type, was the steam-powered press built in London by German inventor Friedrich Koenig. It was used for the London *Times* in 1814 and was capable of producing 1,100 sheets per hour. Cylinder presses provided the speed for high-capacity magazine, newspaper, and book printing.

Mechanized Printing

American Richard Hoe manufactured the first cylinder press in 1846. The first such press was installed at the *Philadelphia Public Ledger*. Early models produced 2,000 impressions per hour. The first web (roll-fed) press was developed by American William Bullock in 1856. These early web presses delivered 15,000 signatures (multiple pages printed on one large sheet) per hour, printed on both sides. A device for folding the papers as

they came from the press was added in 1875. Letterpress printing (metal type) was replaced by offset lithography in the 1960s.

Lithography

The basic principle of lithography—*stone writing*—is based on the principle that oil-based ink and water do not mix. It was discovered by Alois Senefelder of Munich about 1798. Working on a highly porous stone, he sketched his design with a greasy substance that adhered to the stone. He then wet the entire surface with a mixture of gum arabic and water. It wet the blank or nonimage areas, but these non-greasy areas repelled the ink. An ink made of soap, wax, oil, and lampblack was rolled on the stone. This greasy substance coated the image but not the wet blank area. Senefelder called his invention *chemical printing*. Artists used lithography to make reproductions of artwork—drawings and paintings.

The first steam-driven press for lithography was invented in France in 1850 and introduced in the United States by Richard Hoe in 1868. Direct rotary impression for lithography was introduced in the 1890s using grained zinc and aluminum metal plates to which images were hand transferred from stones using starch-coated transfer sheets.

In 1906, the first *offset lithographic* rotary press began printing sheets in Nutley, New Jersey, an invention of Ira Washington Rubel. Offset lithography transfers the image from the plate to a rubber blanket and then to the paper.

Digital Imaging

The age of electronics and computers changed the way printed products were created and produced. The first production operation to be affected was typesetting with the introduction of the Intertype Fotosetter in 1949 and the Photon phototypesetter in 1954. Offset lithography did not need metal type, and this accelerated the growth of photo offset preparation. In 1950, the PDI Electronic Scanner was introduced for color separations. To print color photographs, they must be *separated* into cyan, magenta, yellow, and black plates. Neither technology advanced until the 1970s, when the video display terminal or television screen and

computers were combined to improve electronic typesetting, and electronic dot generation and digital magnification expanded electronic color separation.

The digital revolution in typesetting began in 1985 with the introduction of the plain paper typesetter and the film imagesetter. In 1985, the imagesetter and raster image processor (RIP) fostered the development of device-independent prepress systems known as *desktop publishing* that displaced the device-dependent color electronic prepress system and eventually replaced conventional prepress systems. Typewriters were replaced by video editing terminals in newsrooms.

Platemaking advances began earlier, with laser imaging in 1975. This was followed by computer-to-film in the 1980s and the eventual introduction of computer-to-metal plates in 1991.

Each modern printing process has three main operations: prepress, press, and postpress. The first and last steps are very similar for all printing processes.

The prepress step involves preparing text and graphics for printing. Before the introduction of electronics and computers in printing, most prepress operations were manual using handset type and/or typesetting machines, process cameras for making page films, film processing, manual color correction, film assembly, and page and signature layout (multiple pages on one plate). Notably, digital imaging technology has replaced all of these manual metal and photomechanical operations; pages are now created and assembled on computer screens using desktop software. Postpress or finishing is the operation for cutting, folding, assembling, and binding sheets into final form—and it is largely unchanged.

The press or printing steps used by presses differ for each printing process. There are two major classifications of printing processes: (1) plate, pressure, or impact processes such as offset lithography, letterpress, flexography, gravure, and screen printing and (2) plateless or dynamic processes such as electrophotography, inkjet, ion, or electron charge deposition, magnetography, thermal transfer printing, and inkjet.

Plate printing processes use mechanical printing presses to exert the heavy pressure needed to transfer ink to paper and are the processes used to support long-run (many copies) magazines,

newspapers, books, packaging, and other printed products.

Plateless printing systems are used for copying and digital printing. They produce an image during each cycle of the printing device. The image can be the same or can be changed from cycle to cycle. This feature enables digital printers to print variable information such as coding, addressing, and personalizing promotions and documents. The printing speed, however, is slower than plate processes, but there is no plate loading and no drying time. Therefore, they are used primarily for short runs, on-demand, and/or variable information printing.

Ink-Based Printing Processes

All printing processes are concerned with two types of area: the *image* or printing areas and the *nonimage* or nonprinting areas. After the text and imagery have been prepared for reproduction (the prepress step), each printing process has definitive means of separating the image from the nonimage areas. Ink-based or conventional printing has five types of printing processes:

Planographic—printing and nonprinting areas are on the same plane surface and the difference between them is based on chemical properties—ink is either accepted or rejected. Examples are offset lithography, collotype, and screenless printing.

Relief—the printing areas are on a raised surface and the nonprinting areas are below the surface. Examples are letterpress and flexography.

Intaglio—the nonprinting areas are on a plane surface and the printing areas are etched or engraved below the surface. Examples are gravure and steel-die engraving.

Porous—the printing areas are on fine mesh screens through which ink penetrates, and the nonimage areas are a stencil over the screen to block the flow of ink. Examples are screen printing and stencil duplicating.

Digital—includes electrostatic printing with toner particles or inkjet printing with drops of ink produced on demand or jetted as a stream.

Planographic—Offset Lithography

Offset lithography uses thin aluminum metal or polyester plates with the image and nonimage areas on the same plane. There are two basic

differences between offset lithography and other processes: (1) It is based on the fact that oil (ink) and water do not mix, and (2) it uses the offset principle, in which ink is transferred from the plate to a rubber blanket on an intermediate cylinder and from the blanket to the paper on an impression cylinder.

On a lithographic printing plate, the printing areas are ink-receptive and water-repellent, and nonprinting areas are water-receptive and ink-repellent. When the plate mounted on the plate cylinder of the offset press is rotated, it comes into contact with rollers wet by a water or dampening solution and rollers wet by ink. The dampening solution wets the nonprinting areas of the plate and prevents the ink from wetting these areas. The ink wets the image areas that immediately are transferred to the blanket cylinder. The inked image is transferred by pressure to the paper as the paper passes between the blanket cylinder and the impression cylinder.

Offset is not a process. Letterpress and gravure (and even digital printing) can also be printed using the offset principle. A main advantage of the offset principle is that the resilient rubber blanket produces a clearer impression on a very wide variety of paper surfaces and other materials with both rough and smooth textures. It extends plate life and reduces press makeready (the process of setting up the press for printing by loading plates, paper, and ink).

Both sheetfed and web (roll-fed) presses are used. Sheetfed lithography is used for printing advertising collateral, books, catalogs, greeting cards, posters, labels, packaging, folding boxes, decals, coupons, trading stamps, and art reproductions. Also, many sheetfed presses can perfect (print both sides of the paper, which is also called *duplexing* or *perfecting*) in one pass through the press. Web offset prints on rolls of paper and is used for printing daily and weekly newspapers, inserts, advertising literature, long-run catalogs, books, encyclopedias, and magazines.

Relief—Letterpress

Letterpress is the method of printing Gutenberg invented in 1440 and has been used for job and commercial printing. It is a relief method of printing that can print from cast metal type, molded

duplicate plates (still used for some package printing), or photopolymer plates on which the image or printing areas are raised above the nonprinting areas. Viscous oil-base and ultraviolet (UV) inks are used. The ink rollers come in contact with the raised areas only, and the inked image is transferred directly to the paper. Commercial letterpress has declined in use because too much time was consumed in makeready (adjusting the press form so both the light and heavy areas print with the correct impression). Letterpress makeready is a manual process that is very skill- and time-intensive and therefore very expensive. It is one of the main reasons that the letterpress has declined in use. It is still used for corrugated carton printing, imprinting, and numbering. Four types of presses were used: platen, flatbed cylinder, rotary, and belt. Letterpress is making a comeback in specialty and hobby printing using photopolymer plates.

Relief—Flexography

Flexography is a form of rotary web relief printing like letterpress but using flexible rubber or resilient photopolymer relief plates, and fast-drying low-viscosity, solvent-based, water-based, or UV-based inks fed from an anilox inking system (rollers with many cells in them to facilitate ink delivery). Most flexographic presses are webfed in three basic approaches: *stack*, *in-line*, and *central impression cylinder* presses. Almost any material that can go through a web press can be printed by flexography—tissue, plastic bags, pressure sensitive labels, corrugated board, and materials such as foil, cellophane, polyethylene, and other plastic films. It is well suited for printing large areas of solid color with high gloss and brilliance. The growth of flexography parallels the expansion of the packaging industry, especially flexible packages. Development was based on the central impression cylinder press, laser-engraved ceramic anilox ink metering systems, laser-imaged photo-polymer plates, and water-based and UV inks. In the 1990s, some newspapers attempted to print with flexography approaches.

Intaglio—Gravure

Gravure image areas consist of cells or wells etched or engraved into a copper cylinder, while the unetched surface of the cylinder represents the

nonprinting areas. The image cylinder rotates in a bath of ink. The excess is wiped off the surface by a flexible steel *doctor blade*. The ink remaining in the thousands of recessed cells forms the image by direct transfer to the paper as it passes between the plate cylinder and the impression cylinder. Three types of processes are used for making gravure printing cylinders: (1) *Chemical etching* produces cells of the same size or area with varying depths; (2) *electromechanical engraving* produces cylinders with cells that vary in area and depth; and (3) *direct digital laser etching* produces cells of varying area and depth. Gravure printing produces excellent reproductions of pictures, but slightly ragged type. The high cylinder-making cost usually limits use to very long runs. The use of halftone and film-less gravure has reduced these costs and made gravure competitive in certain shorter run markets. Gravure is used for long runs of newspaper supplements, circulars, magazines, catalogs, as well as special products such as wallpaper and packaging. Cylinders can be reused many times. Many magazines and catalogs are hybrid publications—part gravure and part lithography. The long-run editorial sections are gravure and the short-run geographic, demographic, and advertising sections are printed with offset lithography. All pages are then assembled in automated bindery systems.

Porous—Screen Printing

Formerly known as *silk screen*, this method once employed a porous screen of fine silk, nylon, dacron, or stainless steel mounted on a frame. Many materials are now used to make the stencil, which is produced, manually, photo-mechanically, or electronically. Printing is on a wide range of substrates under the screen by applying ink with a thick consistency forced through the fine mesh openings with a rubber squeegee. The production rate, once limited by the drying time of the ink, has been increased by the development of automatic presses, improved dryers, and new UV inks. Most presses are flat-bed. Rotary screen presses speed up production considerably because they allow continuous operation. Screen printing usually can be recognized by the thick layer of ink and is used for

fabric, apparel (especially T-shirts), signage, and specialty materials.

Lithography, letterpress, flexography, gravure, and screen printing account for the majority of all reproduction on paper and special substrates; however, digital printing processes are making rapid inroads because of their ability to more effectively handle short runs and variable information printing.

Digital Printing Processes

Copying and digital duplicating are also called *reprography* or *reprographics*. For fewer than 100 copies, the *copier* has been the fastest and most economical method of reproduction. Above 100 copies, high-speed copiers and/or duplicators are used, but these are now mostly *digital printers* and can accept hard copy or digital files. Reprography is used extensively by in-house printing departments and quick printing shops. The only method for making copies of documents before 1940 was the photographic print called a *photostat*, which was time-consuming and expensive. In the 1950s, the 3M Thermo-Fax used heat to make copies. The Xerox 914 in 1959 was the first to introduce plain paper copying using electrophotography (toner). Subsequently, a number of photocopying systems were developed, such as photo-based diffusion transfer processes that were popular in Europe. Electrophotography (toner) has dominated the reprographic market, but inkjet printing is making inroads.

Electrophotography, also called *xerography* or *electrostatic printing*, is based on electrostatic transfer of toner to and from a charged photoconductor surface. Many printers use electrophotographic (EP) coatings such as selenium, cadmium sulfide, zinc oxide, or organic photoconductors to produce the images in the copier. The photoconductor converts light energy (photons) into electrical energy (electrons). These coatings are charged with a corona discharge in the dark and lose the charge on standing or when exposed to light, such as that reflected from the white areas of an original or by a laser or other light source. The image areas that remain charged are developed with an oppositely charged dry powder or liquid toner and are transferred from the EP surface onto plain

paper using electrostatic attraction. The electro-photographic coating is cleaned and can be reimaged many times. Color copiers use similar principles, but they have four or more colored toners or inks rather than one. The term *digital press* implies a higher level of operating speed and capability for production applications.

Copiers are no longer manufactured as such. The function of copying a hard copy original is now performed by multifunction printers (MFPs). These devices incorporate a scanner, a digital printer, and a digital front end to accept files. They can scan, print, fax, and copy. Fewer and fewer copiers are made as more and more files are sent to these devices for printing. MFPs may be black-and-white (also called *monochrome*) or full color. Printers theoretically produce originals, and copiers produce copies—but the term *copy* is used in both cases.

Duplicating

Before copiers and digital presses, copies of pages in quantities from 50 to 5,000 were produced on offset lithographic duplicators. There were offset presses in sizes up to 12 by 18 inches (A3+). The offset duplicator was the mainstay of the printing industry and allowed many entrepreneurs to start printing services. Copiers and duplicators were once small offset presses with online polyester platemaking. Over time, they became high-speed copiers that *photographed* paper originals, and today, they are digital printers. Stencil and spirit duplicators are based on the mimeograph that was invented by Thomas Edison and marketed by Albert Blake Dick. They work by forcing ink through a porous stencil and produce copies on plain paper. New versions of these printers use digital files to image the stencils.

Digital Prepress

Prepress processes advanced from metal assembly to pasteups to film. New filmless digital imaging processes create page images directly on printing plates for conventional printing or directly on plateless presses from computer files. These are called *computer-to-printing* or *direct-to-printing* processes. The three types of filmless digital

printing processes are (1) *computer-to-plate* (CTP), (2) *computer-to-plate-on-press* (DI, for direct imaging), and (3) *computer-to-print* (digital printing). All categories use essentially the same prepress digital files output from page composition software, page description languages, and RIPs to drive the lasers or imaging systems of the marking devices.

Digital Printing

Conventional printing uses plates that contain the text and images to be reproduced in quantity on a mechanical press that feeds inks to the plates and exerts heavy pressures to transfer the inked images to paper or other substrate. Digital printers apply copier and new digital technology and use dynamic image carriers. Each cycle of the printer transfers a fresh image to the substrate. It can be the same or different than the previous image. This feature makes it possible to print variable information from print to print, which conventional printing cannot do. It also allows electronic collation, which assembles all pages of a publication in order. Digital printing is used for short-run, on-demand printing (print immediately), but the speed for larger and longer-run documents is slower than plate processes.

Digital printing began in 1970 with the introduction of inkjet printing, followed by EP laser printers in 1978, color electronic laser printers in 1993, and many EP and inkjet color printing presses introduced since 1995. Other digital printing technologies are magnetography, thermal transfer, dye sublimation, and inkjet printing.

All printing today is digital in some manner and all printing technologies accept digital files. Static printing uses an image carrier (plate or cylinder) that makes every impression exactly the same. Digital printing refers to any printing process that does not use a fixed-image image carrier (e.g., a plate). The process is based on the regeneration of printed information for each and every impression of a particular job. Toner, solid ink, and inkjet (in all its forms) are considered digital printing. DI printing (imaging plates on-press) or CTP (imaging plates off-press) are digital in nature, but not digital printing. Over time, offset lithographic plates will be imaged on reusable

image carriers on-press and the age of *plateless* conventional printing will begin.

Computer-to-Print Systems

All purely digital printing systems accept digital files and thus become computer-to-print digital printing systems. They may use EP photoconductor, inkjet, ion- or electron-charge deposition, magnetography, thermal transfer, and dye sublimation technologies, among others. They are called *variable data printing systems* because each impression is regenerated and can then include personalized information from a database. Each impression is an original. Copiers made a second-generation copy.

Magnetography and electron deposition printing use special magnetic toners to produce the printed images. In these processes, there is less need for heat to fuse the toner, and thus a wider array of papers may be used, especially when lithography is used for preprinting.

Thermal transfer uses thermal print heads that melt spots of dry thermoplastic ink on a donor ink ribbon and transfer them to a receiver to produce color labels, logos, wiring diagrams, bar codes, and other similar products. Dye sublimation printers are like thermal transfer printers except the inks on the donor ribbons are replaced by heat-activated dyes. The thermal head converts the dyes to gas spots that condense on the receiver.

Inkjet systems use jets of ink droplets driven by digital signals to print directly on paper or other substrates. The first plateless digital printing system was an inkjet imager introduced in 1970. Two types of inkjet systems are in use: continuous inkjet and drop-on-demand.

Continuous inkjets are used for direct mail and transactional printing, digital color proofing, and variable information on-press color printing systems at speeds up to 1,000 ft per minute.

Drop-on-demand inkjets are divided into thermal, piezo, and solid ink/phase change digital printing systems. Inkjet uses heat and thermal pressure to create droplets of ink. Solid ink begins as a solid and is melted to produce drops. Inkjet systems are rapidly gaining in use, especially since new inks have been developed with light- and water-fastness properties for printing on different substrates. There are also large format webfed and

flatbed printing systems used for producing displays, murals, outdoor exhibits, posters, and paneled billboards. Water-based (aqueous), solvent, and UV inks are used depending on the printer type. Early water-based inkjet inks used dyes; today, many use pigments.

Press Configurations

Printing presses and digital printers are either sheetfed or roll-fed (also called *webfed* and *continuous feed*). Sheetfed presses are used for commercial printing where lightweight and heavyweight paper stocks can be easily changed. Roll-fed presses are used for printing longer runs on light-weight stocks for magazine, catalog, and newspaper publications.

Presses and printers are further categorized by the sheet size (40-inch presses can print eight pages on one side of the sheet at one time), and roll-fed presses use the width of the roll and the cut-off in defining size. Most publication roll-fed presses cut and fold the paper into units called *signatures* that contain 4 to 64 pages.

The printed newspaper is facing many challenges—from electronic reading devices with news distribution via social media, blogs, and websites. As print circulation declines and page sizes shrink, newspaper printing is projected to move to digital printing (toner or inkjet). These devices do not use plates. Digital printers allow printing of individualized newspapers with information aggregated for one person.

Some weeklies are already using webfed inkjet printing. The tabloid format and smaller run lengths are now effectively addressed by digital printing. Newer inkjet printers are webfed with roll widths over 40 inches. This will allow shorter run broadsheet newspapers to print digitally.

Journalism arose because of the printed newspaper and today extends into television, radio, and the Internet. But the printed newspaper will metamorphose from a mass-produced publication to one that is more personalized and the technology to produce it is at hand.

PRIOR RESTRAINT

A prior restraint occurs when a government body or representative tries to stop publication before it occurs. In the United States, prior restraints are considered presumptively unconstitutional and the least acceptable intervention into the speech marketplace. This is because, unlike punishments that occur after expression has taken place, this form of censorship keeps speech from reaching the public in the first place.

This entry explores instances when prior restraints were requested and discusses whether they were permitted or not. The entry also examines how this process is complicated by the existence of websites like WikiLeaks. Finally, the entry explains what the prohibition against prior restraints means for U.S. journalists.

What Is a Prior Restraint?

The notion that government censorship of speech is an improper exercise of power dates back the writings of John Locke in the late 1600s. Locke said that people, not governments, have innate rights including life, liberty, and personal self-fulfillment. The power of the government comes from the people, therefore, government actions to limit natural rights, such as censorship of expression, are always illegitimate.

This thinking and a desire to be free of interference on expression imposed by the British

Parliament helped the framers of the U.S. Constitution shape the First Amendment, which prohibits Congress from making laws that abridge the right to freedom of speech or press. Prior restraints by the government run directly counter to the First Amendment and therefore are allowed only in certain, extreme circumstances.

In the United States, the government may restrict speech by making an entire category unprotected, such as obscenity, incitement, or fighting words, or through a prior restraint. Prior restraints generally occur in two ways. The first is when the government requires that content be submitted for approval before it is distributed, usually through a licensing process. The second and more frequent way prior restraints occur is through a temporary restraining order or injunction against speech.

Occasionally government actions can be viewed as indirect prior restraints. For example, an appeals court said that when a county sheriff tried to pressure credit card companies not to provide services to the classified advertising website Backpage.com, which contained sex ads, this amounted to a prior restraint that harmed the website's right to free speech.

When Prior Restraints Might Be Permitted

The legal doctrine used to determine when prior restraints may be considered constitutional is referred to as the *Near test*, which comes from the 1931 case, *Near v. Minnesota*. In this instance, Jay Near, publisher of the *The Saturday Press*, printed eight issues of his paper in which he accused city government and police of doing nothing to stop Jewish gangsters who he said were operating bootlegging, gambling, and racketeering operations in the city. The paper was shut down for violating a public nuisance law because it was malicious, scandalous, and defamatory. The law provided that any person "engaged in the business" of regularly publishing or circulating an "obscene, lewd, and lascivious" or a "malicious, scandalous and defamatory" newspaper or periodical was guilty of a nuisance and could be prevented from continuing that nuisance.

The U.S. Supreme Court eventually overturned Near's conviction and found the Public Nuisance statute to be a violation of the free press clause of

the First Amendment. The Supreme Court, in a 5–4 decision, said that only in certain, extreme instances may expression be curtailed before it has had a chance to be heard, such as when it threatens national security.

A few years later, in *Nebraska Press Association v. Stuart* (1976), the Supreme Court said in their unanimous decision that if “a threat of criminal or civil sanctions after publication chills speech, prior restraint freezes it.” In addition to judicial injunctions against publication, the Supreme Court said here that prior restraints include government oversight over categories of speech or types of publications, government determinations of acceptable and unacceptable content, and government censorship of expression that occurs before it reaches the speech marketplace.

Prior restraints may be considered constitutional when the speech in question is necessary to protect national security or to prevent obstruction of military recruitment or foreseeable overthrow of the government. Speech that falls into the unprotected categories of obscenity, incitement, and fighting words may also be curtailed.

Under this framework, the government may not censor or prohibit a publication in advance of its release unless it reveals military secrets, incites immediate violence, or meets the legal definition for obscenity. To receive an injunction against a particular publication, the government must demonstrate that the prior restraint is justified.

The National Security Exception

For publication to be prohibited under the national security exception, it must contain specific information that would endanger troops, such as their location, numbers, or movements.

In 1971, the Supreme Court ruled that a court order stopping the publication of information by *The New York Times* that came from a stolen top secret government report about U.S. actions during the Vietnam War was unconstitutional because it did not prevent immediate harm to troops but instead revealed only historical information. In this instance, the federal government was not able to demonstrate that it had a compelling reason for the restriction. This case, *New York Times v. United States*, is often referred to as the *Pentagon*

Papers case. It has become a landmark case and a long-standing example of the Supreme Court’s refusal to allow information to be censored simply because it portrays the United States government in an unfavorable light.

However, when a magazine called *The Progressive* wanted to publish instructions for designing and constructing a hydrogen bomb, courts issued a temporary injunction against sharing what they deemed to be military secrets. The case was eventually dismissed when the information was independently published by other sources.

Today, Internet technology makes it far more difficult for the government to prohibit the release of information. WikiLeaks, which was founded in Iceland in 2006 by Internet activist Julian Assange, has released a number of caches of leaked or stolen documents on its website. For example, in the mid-2000s, WikiLeaks distributed classified U.S. military documents about the war in Afghanistan. Unlike the Pentagon Papers case, the information released by WikiLeaks in this instance was not historical in nature and therefore had the potential to put troops in danger.

WikiLeaks has released classified information provided by former Army intelligence officer Chelsea Manning who was convicted of violating the Espionage Act of 1917. Former National Security Agency (NSA) contractor Edward Snowden has also been charged with violating the Espionage Act for sharing classified information with news organizations about the NSA’s global surveillance program. While some look at Manning and Snowden as whistleblowers shining a light on potentially problematic U.S. global and domestic initiatives, others label them traitors. The existence of websites like WikiLeaks and cases like Manning’s and Snowden’s demonstrates how difficult it is for the government to prevent the release of information in the digital age.

Newsgathering

Prior restraints also arise when institutions or organizations are threatened by the release of information by journalists. However, these too are generally not permitted unless the government can produce clear and convincing evidence that the speech will cause certain harm that cannot be

addressed by less intrusive measures or that the speaker clearly engaged in criminal activity to obtain the information being banned. In the case *CBS v. Davis* (1994), the Supreme Court struck down a state order preventing a newscast that featured hidden camera footage of a meat packing plant. Although the reporters engaged in *calculated misdeeds* to secure the footage by getting jobs at the plant under false pretenses, the Supreme Court ruled that the extraordinary remedy of an injunction was unwarranted.

What Journalists Need to Know

When it comes to prior restraints, it is important for journalists to know where the legal lines exist. If the information in question contains troop location, numbers, or movements, it may be curtailed under the national security exception. Journalists and other speakers may also have their expression restricted when it contains obscene material, as defined by the case *Miller v. California* (1973). If the speaker or publisher engages in criminal activity to gather the information in question, it may also be censored before publication. Other than those instances, the government may not stop publication before it occurs. Therefore journalists, whistleblowers, and others should not be dissuaded from publishing because of threats issued by public officials. The Supreme Court has maintained over a series of cases that prior restraints on speech are presumptively unconstitutional.

PRIVACY

The law of privacy in the United States does not fit into a single conceptual framework. The term *privacy* consists of three distinct, though related, broad legal categories: constitutional privacy, statutory privacy, and the privacy torts or civil claims. In popular discussions and debates, journalists and nonjournalists alike often blur the distinctions. All three are relevant to journalism and everyday life in the United States. This entry first discusses how technological developments of the late 20th and early 21st centuries have forced journalists to grapple with new privacy concerns. It then looks in turn at the three different legal categories of privacy and how they relate to journalism.

As photography grew and the press became more intrusive in the late 19th century, journalists, philosophers, and legal scholars began reexamining the meaning of personal privacy, the limits of ethical journalism, and the law of privacy. Similarly, the explosive growth of the Internet in the late 20th century and the subsequent development of social media and surveillance cameras have raised new ethical and legal concerns about the shifting lines between what is private and what is a matter of legitimate public interest.

With so many people posting to the Internet their personal moments and actions and with only limited protection through privacy settings and privacy policies, journalists and others can find a wealth of information electronically that in the past would have been unavailable. This raises fundamental questions about society and journalism. Are our privacy expectations changing? If the Internet never truly forgets, despite the best efforts of search engine optimization firms that seek to

bury or reorder search results and the European Union that has struggled to implement a legislative right to be forgotten, is everyone and everything online fair game for the tech-savvy, even voyeuristic, journalist?

Although new technologies and somewhat exhibitionist habits of many social media and smartphone users may be pushing the boundaries of journalism ethics, the courts still invoke the settled boundaries of privacy law to those new technologies and habits. The near-ubiquity of video footage and private information on the Internet have not made privacy law irrelevant—just more technical and perhaps even more dangerous for the poorly informed journalist. Websites and other online services may be able to protect themselves by having their user click on and agree to their exception-riddled privacy policies, but journalists do not have those same legal or contractual defenses. Just because one can find the image or information on the Internet, that does not mean the image or information might not, if published, constitute an invasion of privacy. To understand these issues, journalists need to understand the different legal dimensions of privacy in the United States.

Constitutional privacy is rooted in the U.S. Constitution, although the word privacy does not appear in that document. Decisions of the U.S. Supreme Court provide the outlines of the concept, which defines the right of individuals to be free from unreasonable governmental intrusion into their lives. When one thinks of Court decisions dealing with everything from a woman's right to control her reproductive life to gay rights, one is generally dealing with constitutional privacy issues.

Statutory privacy is grounded, again as the terms suggest, in statutes (i.e., laws) typically enacted by state legislatures or Congress. These statutes are subject to change as the political climate in those bodies and the country changes. Statutory privacy deals with everything from health care records to student academic records and even driver's license records. The texts of these laws tend to be very detailed and can vary from state to state in the absence of a federal rule.

The third category consists of the four privacy torts or civil lawsuits for invasions of privacy. This category is generally a question of state law. As a

result, there is some variation from state to state based on common law traditions and relevant state court decisions and state statutes. General treatises on the law, such as the Restatement of Torts, provide excellent sources of guidance.

Most states recognize four privacy torts. These include the following: invasions of privacy through the disclosure of highly personal facts, intrusion upon one's solitude, false light, and, finally, commercial appropriation of one's image or name without permission in connection with the sale of products or services. The precise terms of these claims vary across the country, as discussed more fully below. Several states have rejected the false light claim, for example, concluding it resembles defamation law without its safeguards.

In addition to the multijurisdictional and multiconceptual state of the law, one also must consider the constitutions of the 50 states. Those documents, which tend to be idiosyncratic as well as more easily amended and more detailed than the federal constitution, often have provisions creating certain state privacy rights or rights of access to state-controlled records and information that some might otherwise consider private.

This nuanced world of privacy affects the lives and work of journalists and nonjournalists alike. First, journalists often write about constitutional issues without understanding the subject. Second, state or federal statutes that limit, for example, access to certain records, whether in the possession of the government or a private entity such as a hospital, define both privacy expectations of individuals and the ability of a journalist to obtain newsworthy information. Finally, tort claims over the disclosure information in a news report or over the newsgathering techniques ranging from photography to voice recording obviously affect both nonjournalists and journalists. A brief analysis of each of the three categories of privacy law in the United States follows.

Constitutional Privacy

Although the word "privacy" is nowhere in the text of the U.S. Constitution or any of its 27 amendments, the Supreme Court has recognized a series of privacy-based rights of the people against unreasonable governmental intrusion into or control over personal decisions, personal information,

private places, and the conduct of private lives. Journalists often write about these issues.

Many of these cases have arisen in the context of criminal prosecutions and police investigations, often relying on the Fourth Amendment right against unreasonable searches and seizures. For example, the Supreme Court has found a zone or envelope of privacy surrounding an individual as well as dwellings and other specific places, thus limiting the power of the government to conduct not only physical searches but also certain wiretaps and forms of digitally enabled surveillance. This application of privacy can also limit the legal ability of government agents to allow journalists to be present during some raids, arrests, and other official activities.

The Supreme Court has not limited its privacy rulings to the world of criminal procedure. The Court has extended the general reasoning regarding privacy rights to intimate decisions made by individuals. In a seminal case in the 1960s, the Court held that if one examined the structure and import of various constitutional rights, from the First Amendment to the Fourth to the Equal Protection Clause, one found decisional privacy rights grounded or implied in the “emanations” and “penumbras” of those constitutional provisions. In 1965, the Court used this right of privacy to strike down a state law barring the sale of contraceptives to married couples. As the Court expanded the scope of this implied right of privacy to other matters, including most notably in 1973 to a woman’s right to choose to abort a fetus within certain limits, the right became more controversial.

The constitutional right of privacy developed further when the Court in 2003 used it to strike down a Texas statute that made consensual sexual relations between adults of the same sex a crime. Writing for the court, Justice Anthony Kennedy articulated in *Lawrence v. Texas* (2003) a rationale based on respect for the private lives and intimate choices of consenting adults. The Court employed the same basic rationale in 2015 to invalidate state limitations on the rights of same-sex couples to marry in *Obergefell v. Hodges*.

The lynchpin in each of these decisions is governmental action—be it enforcement of a law related to intimate relationships or the collection of information about a person for criminal

prosecutions or other investigations. The voluntary disclosure of information by people to private businesses, from banks to credit card companies and even social media or software companies, implicates no state action and thus generally no constitutional privacy rights in the United States. These forms of information collection involve questions of personal privacy left to the realms of statutory privacy rights and the privacy torts.

Statutory Privacy

The state legislatures and the U.S. Congress often enact statutes designed to protect individuals from invasions of privacy beyond that which the Constitution covers. Increasingly many of these statutes apply to information collected by private businesses (e.g., banks, health care providers, insurers, search engines, social media companies, and other digital entities) as well as by the government.

The content of these statutes rarely makes for easy or stimulating reading. The laws tend to share some common characteristics. First, the laws tend to be detailed, lengthy, and very technical. Second, the laws are subject to amendments and even repeal as the political winds shift in the relevant legislative body (e.g., Congress). Third, the laws usually represent a balancing of competing interests and thus can be controversial (e.g., the interests of technology companies that trade in personal data with the interests of the users). Fourth, the laws must comply with constitutional standards and are thus subject to review and interpretation by the courts—both state and federal.

Setting forth the detailed requirements of even one of these statutes would exceed the scope of this entry. Some apply primarily to information held or collected by the government, some to private entities, and some to both. The Freedom of Information Act (FOIA), for example, is a law that provides some access to the records of federal agencies, but it also includes exemptions designed to protect personal privacy. The states also have their own public records laws that provide access and define any privacy exceptions in the statutory text or by judicial interpretation. The federal Privacy Act of 1974 is another statute relevant to information held by the federal government about individuals, and it too is very complicated.

Among the more high-profile federal statutes with direct relevance to individuals' rights to privacy information, one will find the Health Insurance Portability and Accountability Act of 1996, which took effect in 2003 (HIPAA), and the Family Educational Rights and Privacy Act (FERPA or the Buckley Amendment) of 1974. HIPAA limits the use and disclosure of individuals' health information by doctors, hospitals, insurers, related businesses, and many employers that provide health care or coverage. FERPA protects the privacy of student education records and applies to all schools that receive federal funds.

Other examples of these laws set standards for all types of information from driver's license records to electronic communications to information collected online about children and others. Some states have laws intended to protect the privacy of certain participants in the judicial system (e.g., jurors and victims of sexual batteries). While some of these laws are constitutional, some are not under the First Amendment, which provides, among other things, certain rights of access to judicial proceedings.

The Privacy Torts

Tort law involves the civil court claims or lawsuits that individuals or businesses may file against one another for violations of certain rights, including privacy rights, through their conduct. The American law of privacy has developed in an ad hoc fashion over many decades and with some significant variation among the states and territories that comprise the country.

In 1960, William Prosser, then the dean of the College of Law at the University of California, Berkeley, published an influential law review article entitled "Privacy" examining hundreds of cases involving privacy tort claims. Prosser identified four distinct torts that cut across state jurisdictional lines: (1) disclosure of embarrassing private facts about individuals; (2) intrusion upon an individual's privacy or solitude; (3) false light or the intentional dissemination of highly offensive false publicity about another; and (4) appropriation, or the use of another person's name or likeness without permission. The discussion that follows represents a general examination of the

most common approaches across the states to individual privacy torts.

The first privacy tort involves the publication of truly private information that would be highly offensive or outrageous to a reasonable person and not a matter of legitimate public concern. This tort assumes the disclosed information is true. If the information is false, one would be looking at a potential defamation or libel claim and not a privacy claim. The disclosure must be widespread, which would apply to just about all disclosures by the media.

The types of information that are most likely to raise this tort include reports about sexual relations, humiliating illnesses or other intimate medical information, intimate personal letters, some very personal family disputes, and photographs taken in private places. The exception for matters of legitimate public concern protects many news media reports, though not necessarily all of them. Information relevant to public events, controversies, trials and most judicial proceedings, or found in publicly available government records typically will not support one of these claims. In one case, the U.S. Supreme Court ruled the news media may legally publish personal information, even the name of a sexual battery victim, if that information is already public. Information, even if embarrassing, that one discloses about himself or herself or that is already widely known cannot be the basis of a claim because the information is not private. Consent is a defense to this claim.

One well-known recent case involved the posting by the Gawker gossip blog of a short, grainy sex tape that showed a celebrity, Terry Bollea ("Hulk Hogan"), engaged in consensual sex with the then-wife of Bollea's then friend. Although Bollea had repeatedly and publicly boasted of his sexual conquests, the disclosure of the private tape so outraged the jury that in 2016 it awarded Bollea \$140 million in damages. A judge subsequently reduced the award and the case was later settled for about \$30 million, but it led to the bankruptcy and sale of Gawker Media, which ran Gawker and several other websites. The case also demonstrated the risks faced by digital news media and even social media users who post highly personal information that is not clearly newsworthy.

The tort of intrusion involves a violation of an individual's solitude, either physically by entering

that space or technologically through photography, videography, audio recorders, or other devices. This tort does not require actual publication of the information obtained, if any. The intrusion itself (i.e., the collection of the information) constitutes the essence of the claim, which resembles some elements of the criminal law of trespass. As a general matter, public spaces and events cannot be the basis for an intrusion claim. People involved in public activities typically have little or no reasonable expectation of privacy in those activities. Private property and private spaces (e.g., locker rooms and bathrooms) are a different matter. One usually needs permission to enter private property, although consent may be implied in some contexts. The use of hidden cameras, secret microphones, drones, powerful telephoto or infrared lenses, and other similar tools can lead to an intrusion claim in cases of misuse. Some states even make the secret, nonconsensual recording of private conversations a serious crime.

The false light case law across the country exhibits a high degree of confusion. This tort is best expressed as the widespread publication of facts that by their arrangement or order place a plaintiff in a false light that is highly offensive to a reasonable person and, in at least stories of public importance, was published with actual malice (i.e., with knowledge of or reckless disregard concerning that false light). Dramatizations of actual events, deceptive juxtapositions of otherwise accurate facts, fictionalizations of events, and docudramas can raise this concern. The confusing and at times conflicting case law as well as similarities to some elements of the law of defamation, particularly defamation by implication, have led some states and courts to reject this tort.

The fourth tort, commercial appropriation, involves the use without permission of an individual's name, likeness, or image for commercial purposes—that is, advertising or promotions for the sale of products or services. Some states expressly include the unauthorized use of distinctive voices and other forms of impersonation as protected elements of a person's identity. This tort does not cover unauthorized use of a name, likeness, or image in news reports, feature stories, or commentary; it typically will not cover certain truly transformative, creative works incorporating the name, likeness, or image.

Most commercial appropriation cases involve advertising that uses a celebrity's name and identity, although private persons can file these claims as well. Celebrities can also file claims based on the right of publicity, a closely related claim that is often confused with commercial appropriation. The unauthorized use of names and likenesses can lead to claims involving works of literature, films, and television shows. Obtaining consent or permission (i.e., a signed, written release) is an important defense to these claims. The related right of publicity may be assigned by contract and may survive a celebrity's death in some states and be inherited or owned by an heir or some other person or business.

PRODUCERS

Producers are the hidden voice of broadcast news, especially television news, in local and network newsrooms across the country. People do not often see their faces or hear their voices, but they touch virtually every word that is written in television news and make the decisions every day that set the news agenda for local and national, television and radio news programming. Since the early 2000s, the role of the producer has exploded into the digital world producing content for websites, mobile, and social media platforms. Producers

work with a wide range of technology to create audio, video, text, interactive digital, graphics, and virtual and augmented reality content across all media platforms.

When most people think about producers, they think about Hollywood film or Broadway theater producers. But news producers are not involved with the finances or staffing of their programs; they are the key content people. News producers' decisions range from what stories go into a television or radio newscast and how they will be presented to researching, reporting, and writing those stories; from graphics, video and audio production elements, to timing and communicating with talent and production during a live broadcast. Digital producers manage everything from the overall look of websites and mobile apps to specific content areas to individual stories and special projects. Most broadcast newsrooms and their digital counterparts are managed from a “producer-centered” perspective, meaning the producers are the center of the decision-making process about what ends up on the air, on the web, on mobile, and on social media. This entry examines the development of the role of producers within the context of news, discusses four main types of producers, and highlights some producers considered pioneers in the production of television and radio news. The entry also addresses concerns about the role of producers in light of developments in journalistic technology and content in the 21st century.

Development of the News Producing Role

One can trace the present-day dominance of the producing role in broadcast news back to early television network news programming in the late 1940s and early 1950s. Prior to television, most radio news was written and produced by the reporters and anchors who also delivered that news. Two of the earliest television news programs were Edward R. Murrow's *See It Now* (1951–1957), and *Douglas Edwards and the News* (1948–1962). The names behind those news programs are almost as famous as the faces and voices viewers knew so well. Fred Friendly, who went on to become Columbia Broadcasting System (CBS) News president, was Murrow's producer and Don Hewitt, creator and longtime

executive producer of *60 Minutes*, was also the creator and producer of the Douglas Edwards broadcast.

At the national network (CBS, National Broadcasting Company [NBC], and American Broadcasting Company [ABC]) level, producers such as Friendly and Hewitt had a great deal of influence over the broadcasts they worked on. They managed the content working closely with the anchors/hosts of the programs, but those anchors typically would have the final say on editorial decisions. As of 2021, the anchors of the major broadcast network evening newscasts still carry the title of Managing Editor, which gives them some editorial control over the content. In early local television newsrooms, the reporters and the assignment desk were the focal points for coverage decisions, and then the news anchors would typically decide the order in which the stories would be broadcast. If there was a producer, that person was an assistant to the anchor, helping with writing, distributing scripts, and sometimes sitting in the control room during the live news program to help with timing. But most early producers in local television news had little editorial control or decision-making power.

The television viewing public got one of its first glimpses of this local producing position in the 1970 hit situation comedy, *The Mary Tyler Moore Show*. Actress Mary Tyler Moore played Mary Richards, a single woman who worked in a Minneapolis television newsroom as an assistant producer. Her role as primarily the girl Friday to the egotistical anchor and the gruff news manager was not very different from the reality of local television news producers in real newsrooms. During the 7 years the award-winning show was on the air, viewers saw Mary Tyler Moore's character grow in responsibility and influence in the newsroom, a trend that also was happening in local television newsrooms.

In the late 1970s and early 1980s, technology changed the complexity of television news and dramatically compressed production time. The change from film to videotape cut processing time out of the production process. The introduction of live technology allowed reporters to go live from the scene of a story and send videotape back to the station for immediate broadcast. Previously reporters and photographers had to be back at the station by 4:00 p.m. for a 6:00 p.m. broadcast,

now they did not have to come back at all and could be still shooting a story at 5:30 p.m. that would lead the 6:00 p.m. broadcast. Graphics and production technology also allowed much more production value to be added to the newscast.

In addition to the rapid technological developments, in the early 1980s, local television stations began adding more newscasts, expanding from a half-hour at six to an hour, then 90 minutes and by the 2010s as much as 2.5 to 3 hours in the early evening. They also expanded morning news and added a half-hour at noon. All these developments made it impossible for one person to write, produce, and anchor a newscast. There was a need to manage all the elements of the newscast, especially during the live broadcast, and the manager of those elements became the local news producer. Those assistants to the anchors, now full-fledged producers, also gained control over the editorial content of the newscasts.

By the early 1990s, local television producers had as much influence and control over local newscasts as their national network counterparts. Most local television newsrooms were described as "producer-driven," clearly indicating the importance and power of the position. An interesting side note to the development of the producing role is the importance it played in moving women into more prominent positions in television news. As accurately portrayed in *The Mary Tyler Moore Show*, the majority of those assistants to the anchors were women. As those assistants became producers, growing in importance and power, so did women in television newsrooms. By 1990, a survey of television news employees found two thirds of producers were women. And as television newsrooms became "producer-driven," the career track to upper-level news management positions changed from reporting and/or anchoring, to producing. According to the 2019 Radio Television Digital News Association survey of women in leadership, more than 35% of all television news directors and nearly half of news directors in the largest 25 TV markets were women.

As broadcast newsrooms began to expand the content to the web and eventually mobile and social platforms, the role of producers expanded. Initially, it was the newscast producers' job to make sure content from their shows got on the stations' websites. Because the web was treated as

an afterthought, often television and radio scripts were simply dumped onto websites, with their associated broadcast cues and technical directions included. As with early newspaper content on the web, broadcast content was rarely adapted for the new platform and was never put on the web before a broadcast. When broadcast stations and networks began to put more emphasis on web, and then mobile, content, the term *producer* stuck for the new managers and creators of this content. One frequently finds this term in digital-only news sites as well.

Types of Producers

There are four main types of producers in radio, television, online, and mobile news, and their roles range from overseeing content and production of an individual story to overseeing an entire newscast, to multiple newscasts.

Field Producer/Digital Content Producer—A field/digital content producer works very much like a reporter but, in video and audio content, is not typically the face or voice of the story. At most local television and radio stations, reporters are their own field/digital content producers. They do the research, interviews and writing, and often shoot their own video and/or edit the video/sound for their stories and then put those stories on air and on the web. In the early 2000s, the title reporter/field producer migrated to multimedia journalist (MMJ) in most small- and medium-market local television or radio stations, and national networks even used MMJs in international bureaus.

In larger local stations and at the broadcast and cable network level, a field producer will often do much of the work to put the story together, including research, setting up interviews, writing, and overseeing the editing of the story. A reporter or anchor will become the on-air talent, recording the script and perhaps going out into the field and conducting interviews the field producer sets up, as well as doing a stand-up (the part of the story in which viewers see the reporter talking on camera). Field producers also are used for special reports, such as consumer or health stories, investigative reports, and in-depth stories, such as the segments of a news magazine program such as *60 Minutes* or *20/20*. A separate digital content

producer may be working on the same story for the website and use some of the video or sound from the on-air story. For digital-only news outlets, the digital content producer typically works like a broadcast reporter/MMJ, although some team up with a video/audio field producer to gather and edit sound and video for the story.

Field/digital content producers may oversee more than just a single story when there is breaking news or a major event. In those situations, much of the coverage of the story is live from the story scene, so field producers supervise all the coverage from the site, for example, from candidate headquarters on election night.

Line or Show Producer—This is the position most typically thought of when the title “producer” is used in radio or television. The line producer is the person in charge of an entire newscast or other news program, or a segment of the newscast, such as weather or sports. Line producers manage every part of a newscast, from deciding what stories will go into their newscasts and in what order those stories will air, to how long and in what format the stories will be, which stories will be promoted, and which stories will be live from the field. Line producers write many of the stories in their newscast, and they decide which stories have graphics. Using automated production tools, they often create those graphics. They are the key communication hub for everyone who contributes to, or oversees, the newscast. While the newscast is on the air live, the line producer times the show to make sure it gets off the air on time, as well as communicates with all live locations out in the field, the anchors and the director of the show, to make sure everything is going on air correctly. Because of their experience in the control room during live newscasts, line producers also typically call the shots during live breaking news coverage. With no scripts and no rundowns to guide what goes on the air, the line producer literally decides on the fly what comes up next and communicates that to everyone as it goes on the air. There is nothing more stressful for a producer than live, real-time producing, but many will tell you, there is also nothing more exciting and fun.

Executive Producer—The executive producer is a manager of producers and newscasts. The executive producer might have responsibility for

overseeing all the newscasts of a local station, a group of newscasts, such as the morning news and noon show, or the early evening newscasts, or perhaps just one newscast, such as the late news. Larger stations are likely to have multiple executive producers, while smaller stations may only have one. At the network level, each news program has its own executive producer. The executive producer approves the producer's line-up of stories, reviews scripts, and works with reporters on developing their stories as well as approving scripts. The executive producer is the "big picture" person who is responsible for ensuring that each program follows the newsroom's overall philosophy toward news content and targets the audience for each newscast's time period. This is a management position that will help determine the strategic direction of the newsroom and implement that strategy in individual programs. The executive producer also is typically the person who will lead the planning for special event coverage, such as election night or a major community event.

Special Projects Producer—This producer and/or executive producer does not work on daily news, but as the name implies, works on special projects that ultimately air during newscasts, news specials, and/or are posted on a website. Special projects producers typically oversee health and consumer segments, regular feature segments, interview segments, and investigative/long-form stories. Special projects are usually planned and produced over weeks or months and are highly promoted to draw in viewers to a newscast, website, or other news programs. The special projects producer may directly produce the segments and stories in the field or supervise the work of other field producers and/or reporters.

At the national news level, radio, cable, or broadcast networks and digital outlets have several producers in each of these categories for each news program or web page or mobile app produced. One may see credits that include Washington or New York Producer, Senior Producer, Supervising Producer, Foreign Producer, Assistant Producer, or Segment Producer, among others. But most of those titles fit into one of the above categories—it all depends on what the producer is responsible for.

Producing Pioneers

There are many notable producers who could be recognized, but here are just a few who helped define television and radio news production in the 1950s, 1960s, and 1970s.

Roone Arledge (1931–2002)—Arledge is most closely associated with his pioneering work in sports broadcasting, but he also took over the news division for ABC. Interestingly, it was an idea for a show called *For Men Only*, modeled after *Playboy* magazine, which caught the eye of an ABC executive who was just about to take the fledgling network into sports programming. In 1960, producing his first college football game, Arledge smashed the boundaries between the camera and the sporting event, taking viewers right down on the field. From there, he created and produced *Wide World of Sports*, *Monday Night Football*, and ten ABC Olympic broadcasts. His success with sports led ABC to name him president of the struggling news division, along with the sports division in 1977. Arledge created the news magazine, *20/20*, and reshaped the evening news broadcast into *ABC World News Tonight* using many of the same flashy graphics and production techniques he had pioneered in *Wide World of Sports*. In 1979, Arledge changed late-night television with a series of special reports on the Iranian hostage crisis that eventually became *Nightline*.

Fred Friendly (1915–1998)—Friendly often falls behind Edward R. Murrow's shadow, but was a pioneer in his own right, producing long-form documentary-style news programming. In the 1940s, he began his first producing project with Murrow, working on historical albums for Columbia Records. He experimented with the use of audiotape from actual radio news coverage in these albums, and when he did not have the original sound from a news report, he would recreate the event on tape (which to this day causes headaches for radio historians, because he did not identify which was real and which was recreated). Friendly did a stint with NBC radio, producing a 1950 NBC radio series called *The Quick and the Dead* on the atomic bomb, which brought together broadcast and print news reporters, experts, and the star power of Bob Hope as host. That award-winning series led to his full-time job at CBS,

where he worked with Murrow to produce the CBS Radio documentary series *Hear It Now*, which moved to TV as *See It Now* in 1951, becoming one of the first regularly scheduled television news programs. People often credit a 1954 *See It Now* program on Senator Joseph McCarthy with helping to end McCarthy's anti-communism crusade. Friendly continued his groundbreaking work in news documentary programs with *CBS Reports*. As *See It Now* and *CBS Reports* moved out of the studio and into the field, Friendly's producing style incorporated video and natural sound (the background noise one hears at a scene, such as the crowd cheering at a sporting event, or trees rustling in the wind) in ways that moved television news production toward maximizing the visual image element of the medium.

Reuven Frank (1920–2006)—Frank often receives credit for bringing television out of radio's shadow by always emphasizing the pictures. He wrote in a famous 16-page memorandum on his creation, *The Huntley-Brinkley Report*, that pictures were the point of television reporting. Frank started his news career as a reporter for the *Newark Evening News* in New Jersey. In 1950, he moved to NBC News and in 1956 he teamed Chet Huntley, broadcasting from New York, with David Brinkley, broadcasting in Washington, to create the first television news superstars. *The Huntley-Brinkley Report* dominated network television evening news ratings until Walter Cronkite came along for CBS. Frank's memorandum on the format and look of the newscast was detailed, even down to camera angles, and included guidelines for the visual storytelling techniques he believed were the heart and soul of television. The memorandum became a blueprint for television newscasts everywhere. Frank also produced documentaries, including the 1962 Emmy award-winning *The Tunnel*, which detailed the escape of Germans through a tunnel under the Berlin Wall. Frank was president of NBC News for two terms, from 1968 to 1972 and 1982 to 1984.

Don Hewitt (1922–2009)—Although Hewitt was trained as a journalist and worked the first 5 years of his career at the *New York Herald Tribune*, when he came to CBS in 1948, he was as involved with the production side of news programming as he was with the editorial content. He was the producer and director for the networks' evening

newscast for 14 years. He also directed Murrow's *See It Now* program and the first televised presidential debates between Nixon and Kennedy. As the executive producer for the *CBS Evening News with Walter Cronkite*, Hewitt helped Cronkite become known as the most trusted man in America. Hewitt was instrumental in developing the early formats for the network evening news. But Hewitt is best known for creating the first television news magazine program, and the longest running prime-time broadcast program, *60 Minutes*. Hewitt remained an executive producer of *60 Minutes* with very tight control over story content until he retired in 2004 at age 81.

Al Primo (1935–)—Primo worked in the early days of local television news, and took local news producing to whole a new level with the creation of the first format exclusively designed for it. Primo debuted the format he called *Eyewitness News* in 1959 in Cleveland and then took it to Philadelphia and New York, successfully beating the competition in both cities. The format made heavy use of reporters as "eyewitnesses" for the anchor in the studio and the viewer at home. Al Primo also receives credit for creating "happy talk," in which the studio anchors chat about stories, and talk with weather and sports anchors. The *Eyewitness News* format spread across the country and internationally, eventually being used by more than 150 stations in the United States and in Mexico, Canada, Japan, and Australia. A handful of U.S. stations still used the *Eyewitness News* name in the early 2000s. The success of the format also led to the development of a rival format in 1965 called *Action News*, which incorporated fewer reporters and lots of short stories with video or some visual element for each story. *Action News* also was still in use by a few stations into the 21st century.

Concerns

As journalism moves through the incredible technological and content changes of the 21st century, there are some concerns specifically targeted at television news producers. Because they exert so much control over the content and presentation of news programming, and local television news remains the primary source of news and information for people even as digital and mobile

overtake all other sources, it is important to note those concerns.

The age and experience level of people in news line producer positions has been a worry for years, and it continues to be a problem. Good news producers in radio or television are difficult to find and keep at stations and the networks. The job is very demanding, and highly stressful, requiring someone with great writing skills, quick decision-making ability, solid news judgment, creativity, people management skills, and the ability to work extremely well under deadline pressure. It is definitely not a job for everyone, and because of the high stress level, tends to be a job for younger people, with a high burnout rate. Producers are in high demand in television news, leading local stations in all size markets to hire students right out of college to be the key decision makers for their newscasts. Because of that, there is a widening gap, especially in local television newsrooms, in age and experience between the producers and executive producers who control news programs, and the anchors and reporters who contribute to those programs. A 2001 survey of local television news producers, anchors, reporters, and news managers found that more than 60% of anchors had 10 plus years of experience, but only 20% of producers had that many years in the news business, and as of 2021, this has not changed. News managers and anchors express frustration about the inability to hire producers who have not only journalism experience, but also life experience to fall back on when making daily judgment calls about stories. Young producers are less likely to be engaged with the communities they live in, have less historical context for stories, and do not relate to the typically much older audience for news. One anchor in the 2001 survey said that children were producing newscasts. However, these younger producers bring key mobile and social media skills to radio and television newsrooms, which are highly prized as most broadcast media outlets become multiscreen content producers.

Related to the age and experience concern is one of flash over substance. Younger producers, raised on video games, social media, and mobile content, find themselves increasingly pressured to produce television newscasts that attract younger viewers. As technology continues to make the use of graphics, music, virtual and augmented reality,

and other production tools easier and less expensive, producers focus on glitzy and jazzing up their news programs more than the story content. In addition to high production value, most television news sets are tools for producers to add multiple venues for anchors and reporters to deliver content. In addition, live technology and pressure to be the first with breaking news also tend to replace journalism judgment. A television or radio news producer often feels pushed to change a newscast rundown that they may have worked all day crafting in favor of an accident or crime story that happens right before or during the newscast. Since the newscast is not an accordion of time, substantial stories may end up getting dropped to accommodate what may be a minor story that happens to break as the newscast goes to air. This pressure to have more live and breaking news puts producers in the hotseat to shuffle their newscasts, and to make instant decisions with no time for the careful thought that went into the original newscast rundown. Automation in the production process has added additional stress to the process of “blowing up the rundown.” Whereas up until the early 2000s, if producers needed to make a change during a newscast, they simply let the director and on-air talent know. But news production is steadily automating to the point where most live television programming is computerized, so directors now code every bit of information into an automation system and during the show simply hit a computer keyboard to move forward to the next set of commands. These systems control microphones, video, graphics, and cameras. In order to make a change, new coding has to be entered into the system, so instant changes are much more complicated.

Broadcast news producers are the people most directly responsible for the news people consume on television and radio and via mobile and social media sources. Producing is a high-power, high-stress job that is best suited to those who thrive under deadline pressure, like to be in control, and can juggle multiple tasks at the same time. One typically does not see or hear from the producers of news content, but their handprints are on everything one does see, hear and read. The position has developed from little more than an assistant gopher when television and radio news first started as very simple productions, to the person at the center of the broadcast and digital news

process in a world of high-tech, fast-paced, live programming.

PROPAGANDA

Propaganda is the organization, the message, or means of communication that is designed to persuade people to take a position or to question accepted thinking. Propaganda often uses incorrect information and hides the source of the information. It is known as a type of political warfare. Rather than attacking an enemy with military force-like weapons, propaganda uses deceptive communication. It is cheaper and physically safer than using military weapons. Propaganda uses a range of techniques. "Fake news" is one technique, but propaganda is more than fake news.

This entry examines the meaning of propaganda, its origins, messages, and means and methods. It also examines specific types of propaganda and the relationship between propaganda and misinformation. Finally, this entry examines the use of propaganda in wars and other conflicts, its status as fake evidence, and its circulation in and through the arts.

Meanings of Propaganda

While the common view is that propaganda is the message itself, it has been viewed in different ways over time. How propaganda is constructed, by what kinds of organizations, and the responses have varied over time because of the historical context. Understanding the complexity of propaganda makes it easier to spot and analyze.

Origins as Organizations

The formal beginning of propaganda is credited to the Roman Catholic Church during the medieval period when the Reformation was challenging that church's authority throughout Europe. Protestantism was rising between the 14th and 16th centuries. A Catholic pope created a commission to expand where Catholicism was taught. This commission evolved into the *Sacra Congregatio de Propaganda Fide* [Congregation for the Propagation of the Faith], which dealt with the church's foreign enterprises and taxed new cardinals. Within 5 years, the Collegium Urbanum, functioning as a school of propaganda, came into place to prepare the new priests.

In this period, propaganda came to be known as the organization with the mission of putting forth the ideas of those who created it. Although propaganda would become known as the messages themselves and their distribution, propaganda was equated with organizations. More recently, during World War I, the different countries had their own propaganda offices. Great Britain had a Ministry of Information and an Enemy Propaganda Department. The United States created the Committee on Public Information (CPI), nicknamed the Creel Committee because it was run by journalist George Creel. The CPI had a Foreign Section for the purpose of communicating to its friends and allies as well as its

enemies abroad. German propaganda, in contrast, was largely run by the army. These different kinds of organizations created different kinds of propaganda. The more professionally organized British and American offices relied on facts compared to the German army's.

Because of World War I, propaganda became better known. The major countries involved in World War II continued to rely on propaganda offices. Britain still ran its Ministry of Information, but also the Political Warfare Executive against the opposition. The United States ran its propaganda through a similar Office of War Information, although the Office of Strategic Services administered some psychological operations. In Germany, most propaganda came from the *Reichsministerium für Volksaufklärung und Propaganda* [Reich Ministry for Popular Enlightenment and Propaganda].

Messages for the Masses

As a mass society developed in the late 1800s and early 1900s, authorities saw the benefits and risks of propaganda as messages. The organizations created to spread propaganda did so because the organization's founders felt they would benefit from affecting how people thought and felt. Behind this thinking were assumptions about the public.

An early mass communication concept was known by two names, *the magic bullet* and *hypodermic needle*. Both describe a process by which people's minds could be easily changed by messages. Propagandists assumed the masses were simplistic and easily manipulated. This concept from the first half of the 20th century appeared to have some plausibility in light of events. For example, Russians overthrew their monarchy in 1917 and replaced it with a different form of organized oppression. Later, Germans followed Adolf Hitler and the Nazis down a path of extreme hatred and violence.

It was reasonable for responsible leaders during these decades to fear the possible effects of propaganda on a mass public after witnessing such horrible events. They did not want similar things happening in their own countries, yet they wanted to be able to use the mass media for positive activities, such as improving the health of the public through mass messaging.

The two wars did not eliminate the use of propaganda for religion, but they did prioritize politics as the primary purpose for propaganda. It could be used for social control, which would lead to debates if even well-meaning propaganda campaigns were good for a society. Propaganda, in meaning, became known less for messaging with a persuasive purpose and known more for manipulation and bias. Because of propaganda's history in the 20th century—one which went beyond wars and revolutions—some people may now think they are immune to the message. However, the assumption that someone is beyond the effects of propaganda may leave them more vulnerable because they are not critically analyzing messages they agree with or consider as plausible as other messages.

Nowadays, the common view of propaganda is that it is biased, if not deceitful, information. So while this view holds all propaganda is information, not all information is propaganda. Simply put, a central idea of propaganda is that people can be persuaded how to think and act if given the right information, in the most appropriate ways, and with frequency to reinforce the ideas. Propaganda tends to be systematic messaging; otherwise, the message is unlikely to stick.

Propaganda may mean different things to different people, but disagreeing with the message does not make it propaganda. Propaganda has to do with the intent of sending the message. It benefits those in charge. Propaganda has been compared to advertising. A significant difference with advertising is that people understand the process and what they are being sold. Propaganda, on the contrary, is a message that is not as clear in purpose as an advertisement.

The Means and Methods of Propaganda

As already explained, propaganda has been treated as an organization and a message. It has also been described as how that message is shared, such as the physical form or medium of communication. The treatment of a medium of propaganda is tricky because a medium, like television, is more often used for content that is not propaganda. Most people who study propaganda do not argue that a medium is a propaganda, but it is helpful to know how propaganda has been transmitted.

Printed documents have been used for propaganda in numerous locations. Political pamphlets made by colonial patriots were the literature of the American revolutions. The best known writer of the patriot cause was Thomas Paine, who created *Common Sense* and *Crisis*.

Similarly, leaflets were regularly used in Europe to create confusion or to break down the opposition. In 1806, the British Navy flew kites from the HMS *Pallas* to drop leaflets on the French. A little more than a century later, leaflets were dropped on German troops from aerial balloons. The Russian revolutionaries used leaflets to try to convince German soldiers to join them as workers of the world. Leaflets were still used in World War II, the Vietnam War, and the Gulf Wars. They remain useful to this day when one side may not have access to other forms of communication.

Two kinds of radio signals are useful for sending communications over distances. The AM frequencies may lack the clarity of FM, but FM signals travel farther. Short-wave signals travel even farther by reflecting off the ionosphere and reaching far-away listeners, such as across continents.

Radio, although very young, was used during World War I and then during the Great Depression, when many people could not afford daily newspapers. U.S. President Franklin D. Roosevelt gave his “fireside chats” via the radio to inform Americans and keep their spirits up during the Depression. At this same time, in the 1930s, Hitler used the radio to promote his idea of a renewed Germany.

Radio has been used for other purposes. In some cases, radio was used for distance education. Radio has also been used to share messages across an empire or to a diaspora, such as by the British Broadcasting Corporation’s Empire Service and Germany’s Deutsche Welle, both formed between the two world wars.

Radio was employed to discourage soldiers during World War II. The British broadcast to German soldiers to weaken morale. The broadcasts were made to sound as if they were produced by dissident Germans located in Germany. Radio propaganda aimed at soldiers occurred on both sides, such as Japan’s use of multiple women to speak to Allied soldiers in the Pacific region. The soldiers gave a single nickname for all the women, Tokyo Rose.

The Cold War era was one of reliance on the radio for a variety of purposes. Spies could receive messages from abroad via the short wave. Western countries established propaganda stations, such as Radio Free Europe, Radio Liberty, and Radio in the American Sector, to combat internal propaganda efforts in communist countries.

Radio Free Europe and Radio Liberty were funded by the Central Intelligence Agency after World War II until 1971, and then Congress directed funding to a broadcasting board for their operations. Radio Free Europe was aimed at the countries that came under the control of the Soviet Union, like Poland and Hungary. Radio Liberty broadcasts were directed at the Soviet Union.

Radio in the American Sector, more commonly referred to as *RIAS*, operated in the American sector of a divided Berlin, Germany. RIAS was broadcast for all who could listen, including those under the control of East Germany and the Soviet Union. East German officials suggested RIAS more appropriately stood for Revanchism, Intervention, Anti-Bolshevism, and Sabotage. RIAS lasted from 1946 until 1993.

Television, which became popular after World War II, has been used for various propaganda purposes, most notably in the pretense of news. Citizens of the modern Russian Federation rely on television for their news. Because the Russian government dominates television news in Russia, citizens are given a steady supply of pro-government propaganda. In the United States, Fox News has resembled Russian-style propaganda television for giving a highly restricted view of the world and disregarding some traditional journalist practices like routinely correcting errors in stories.

The Internet has become sort of an all-in-one medium for propaganda. Social media posts are the new leaflets, websites are like pamphlets with stories, and various platforms can play podcasts and videos like radio and television. Fake news is not a new phenomenon, but it spreads faster on the Internet than through previous mediums.

Specific Propaganda Tactics and Targets

There are the subjects of propaganda (who the propaganda is about), targets of propaganda (the

audiences), and motivations for propaganda (the goals of propaganda. Some specific aspects of these have been repeated over time so often that they deserve attention.

Overt Propaganda

Overt propaganda is based on truth—or a perceived truth—that represents an official position. For example, a nation's health and safety office may have an information wing that provides useful tips on exercise, eating better, and avoiding illnesses. The public may not like the advice, but it is pretty clear who is providing the messages and the reasons for sharing them.

Overt propaganda can be directed to the public of an enemy government. Again, the messages come from an identifiable source and the purpose is relatively clear. An example would be the radio broadcasts of the Voice of America (VOA) during the Cold War. The VOA would broadcast news stories so that Soviet citizens could learn of events without the usual Soviet censorship. VOA would also play music to show off American culture, like jazz. The VOA would broadcast in less developed countries, as well.

A more extreme version of this type of propaganda is the Nazi's Ministry for Popular Enlightenment and Propaganda. The ministry was run by Joseph Goebbels, and it never hid its purpose. The goal of the ministry was to get Germans to think the same about Germany. It is at this extreme that truth is fading away if it relies on lies, not just information and motivational speaking, and overlapping covert propaganda.

Covert Propaganda

Covert propaganda is designed to be hard to detect as propaganda because it is difficult to identify the original source, which would likely indicate the potential for biased or faked information. The propaganda radio broadcasting by Britain, pretending to be German, and aimed at Germany during World War II was covert propaganda, as was the German radio pretending to be Scottish during the same war.

A reason for aiming covert propaganda at enemy soldiers is to lower morale because the audience is not sure of the accuracy, but may

believe it without oppositional information. Even if the audience does not completely believe the covert propaganda, they may not trust the reliable and accurate information they otherwise receive at home.

Disinformation

Disinformation is part of a formal process of information warfare that the Soviet Union's intelligence agency created, and which is continued by the Russian Federation. Disinformation is information that is intentionally false and usually distributed in a secret or covert manner. It is a form of covert propaganda that was used during World War II and the Cold War. Soviet intelligence considered disinformation to be an "active measure" in its political warfare.

A disinformation campaign involves creating a lie and then getting the lie in the news. The Soviet intelligence office, *Komitet Gosudarstvennoy Bezopasnosti* (KGB), would create the lie, and then try to get the lie in the news. A disinformation story would often have a small element of truth in it to make the whole story appear more plausible.

In some cases, agents posed as journalists and published stories in newspapers around the world. Some researchers produced falsified studies that received news coverage. One of the most successful campaigns was when the KGB spread the lie that the United States developed the AIDS virus to use as a biological weapon, but the virus got out of the lab and began infecting people.

It is not surprising that the Russian Federation has carried disinformation into the Internet age. But even with technological changes, disinformation campaigns hope their stories appear in mainstream media. The Western style of journalism that seeks comments from both sides of a story legitimizes the possibility that the lie is true. Thus, disinformation takes advantage of the fundamental nature of objective journalism.

Disinformation agents' most reliable targets tend to be people who believe in conspiracy theories because they lean toward believing lies. This was evident in the 2016 U.S. presidential campaign when a lie was spread through online chat rooms that members and supporters of Hillary Clinton's campaign were involved in a pedophile ring

operating out of a pizza restaurant in Washington, D.C. The lie was so effective that one man decided to investigate it himself and shot a rifle in the restaurant before being arrested.

Trolls and bots are now used in disinformation campaigns. They operate out of so-called propaganda farms in countries like Russia and Iran. The most notable farm is the Internet Research Agency (IRA) in Russia, which was used against the 2016 American presidential election to create distrust and hostility. In 2018, Twitter released more than 10 million tweets for analysis that Twitter identified as being mass-produced for information campaigns.

The use of Twitter and Facebook in disinformation campaigns led to questions in multiple countries about what limits should be placed on social media business that benefit economically from these kinds of disinformation campaigns.

War, Atrocities, and Martyrs

The propaganda of violence has often been used to motivate people to undertake acts of violence in response to real or false violence, regardless of if the stories were true or not. An early example is Pope Urban II's speech that accused Muslims of crimes against Christians, which contributed to the Crusades in the Middle Ages with the goal of taking back Jerusalem.

Martyrdom is tied with the propaganda of violence because the victims are celebrated or recognized in a positive fashion for their death. This encourages the righteousness of one's own beliefs and may convince some people to become martyrs. John Foxe's 1556 *Acts and Monuments* (*Book of Martyrs*) is an early example of recognizing martyrs and being used to promote a view, in this case learning about atrocities committed by the Catholic Church against Protestants. It is considered one of the most important books of its time for its massive size and influence on English political and religious authorities.

War propaganda was frequent in the first true mass media century, the 1900s. The Great War was the name of the war, which would become known as World War I after World War II. World War I started in 1914 and formally ended in 1918. This was a war of citizen soldiers, not of armies-for-hire like wars before, such as the

British use of Hessian soldiers in the American Revolutionary War, the Swiss Guard in the French Revolution, and the Viking-originated Varangian Guard who served the Byzantine Emperor. Citizen-to-soldier armies became prepared for war through propaganda.

This kind of propaganda requires different functions. It creates or focuses hatred against the defined enemy. It must also convince the public that its beliefs, lifestyle, and/or values are different than the enemy's and that their own cause to protect these is better than the enemy's. Propaganda is also used to gain help from other entities, like other countries. Then, it is used to strengthen and maintain the alliance. Propaganda has often been used to make the enemy look extremely dangerous and different. Oftentimes, existing prejudices were references and worsened for effect. For example, Italian propaganda during World War I showed a German soldier stabbing a baby with a bayonet. Germany used anti-British propaganda by attacking any supposed British righteousness because of past British atrocities in its empire, such as in Ireland and India.

Some propaganda support was aimed at recruitment without a direct racist, ethnic, or religious attack. For example, the Uncle Sam "I Want You" World War I poster was modeled on the British poster, "Britons: Lord Kirchner Wants You. Join Your Country's Army! God save the King." Both make the appeal for enlistment without a biased framing of the enemy. This propaganda is a form of overt propaganda.

By World War II, which started in 1939 when Nazi Germany invaded Poland from the west and the Soviet Union responded from the east, the public had somewhat tired of propaganda. Many people in democracies were suspicious of propaganda because of what they saw two decades before during World War I. Some countries, like Britain and France, investigated the accuracy of propaganda. In Germany, anti-Semitic propaganda was ubiquitous and many believed it. Germans were taught that they were a superior race and that Jews, Slavs, and people of color were causing the world's problems. The Slavic people, the German citizens were told, should become slaves for Germany.

These wars revealed the limits of atrocity and related propaganda. The British did not use it about Germany because the government felt its

own citizens recognized the Nazi values were radically wrong. Public has to be willing to believe the propaganda for it to be effective and not create a suspicion of the sender of the message. News of German concentration camps emerged during World War II, but the true stories were easy to dismiss as propaganda because of past war propaganda.

The use of such propaganda also affects the perception of violence and news coverage. During World War II, the Soviet Union massacred more than 14,000 Polish officers who were their prisoners. The secret police buried them in mass graves, which were later uncovered by German soldiers in Russia. The Germans correctly blamed the Soviets, but the Allies accepted the Soviet lie that Germany committed the massacre. The British and American public was quick to believe their governments because of previous Nazi atrocities. This made it difficult for the British and American governments to punish the Soviet Union after the war. The two governments had to admit they lied, but critics and the Soviet Union argued Britain and the United States could not be trusted because, one way or the other, they were liars. As the United States investigated the so-called Katyn Massacre in the early 1950s, the United States was accused of using biological weapons during the Korean conflict. Even in 2019, North Korea accused the United States of developing such weapons to use against them. This demonstrates how atrocity and related propaganda builds off of both previous violence and propaganda.

This form of propaganda continued appearing at times and at a variety of places where extreme violence existed. For example, the Kosovo War in the Balkans, during the late 1990s, was a conflict of religions and nationalities. It was also the first war when the Internet played a role in communications. The tightly restricted access to war zones by both sides and the emergence of the Internet as a source of information was a preview of the future.

Martyrdom has also been associated with terrorism and propaganda, especially when people are recruited to sacrifice themselves for a cause and become a martyr. The deaths of martyrs have been used for continued recruiting and to encourage others to help in different ways.

Fake Evidence

Evidence is used to make a convincing argument. But not all evidence is true—some evidence is faked. The history of propaganda includes the creation and distribution of faked evidence.

Probably the most commonly cited fake evidence is *The Protocols of the Elders of Zion*, published in 1903 and appearing to come from Jewish thinkers and leaders planning to take over the world. The source of the document is believed to be an officer in the Russian tsar's secret police, who wanted to unite non-Jewish Russians against the Jewish Russians. The document became better known after World War I and was one of the important source documents for the Nazi movement in Germany. In the United States, Henry Ford, founder of Ford automobiles, used the *Protocols* to spread anti-Semitic messages.

Another example is a medal a German made for himself that celebrates the 1915 sinking of a British ocean liner, the RMS *Lusitania*. The British were able to photograph a copy of the medal and send images to the United States, which had lost 128 Americans in the sinking. Britain sent these to encourage Americans to join World War I. Britain also manufactured copies with a leaflet on German offenses. While the original medal was not official because copies were made for personal use, it came to symbolize German violence and the celebration of it.

The Arts

Design, photography, music, and movies all have played special roles as propaganda media. Each one's special characteristics lend themselves to certain propaganda messages. The artfulness of their presentations—compared to news reports—can increase the emotional appeal of the propaganda.

Art has long been used as a way to communicate stories and values. In religion, paintings and other art forms served to communicate to people who could not read. Paintings were also associated with the rulers because most people could not afford a painting. Naturally, rulers wanted art that elevated them above the masses. So art was a privilege of the elites, and they could choose the stories that were shared.

Art has been used to support patriotism, nationalism, and myths that all function as varying degrees of propaganda. For example, Howard Chandler Christy's famous painting of the signing of the American Constitution is more myth than journalism because it was not designed to be historically accurate, except for the faces of the subjects.

The Soviet Union made extensive use of visual propaganda to celebrate workers and encourage more labor. The country actively used modern graphic design techniques, for the time, photography, and movies. After a while, the dynamic style was largely dropped for heavy-handed propaganda without experimentation. Soviet leader Joseph Stalin decided to prevent the use of new and exploratory styles of art from the West.

During the Depression, U.S. President Franklin D. Roosevelt funded the Farm Security Administration, which hired photographers to document conditions in America. Photographs were shared with news publications for distribution. It was hoped that people around the country would see the suffering and struggling of other people, which could lead to sympathy and support for taking care of the needy.

Nazi Germany used both classic and newer art forms for propaganda. Hitler was inspired by the music of Richard Wagner and movies were used to promote his ideas. *Triumph des Willens* (Triumph of the Will), a 1935 documentary-style propaganda film, was made to convince people Germany was returning to greatness. Its aesthetic style and exclusion of themes that would have made it more offensive, such as anti-Semitism, helped to attract audiences to the propaganda piece.

During the Cold War, the United States used the modernist art form of abstract expressionism as a propaganda tool. The U.S. government wanted to show people in other countries, especially those aligned with the Soviet Union, that artists could create what they wanted and in any style they wanted, unlike those in the Soviet Union.

PUBLIC BROADCASTING SERVICE

The Public Broadcasting Service (PBS) was created in 1969 by the Corporation for Public Broadcasting (CPB) both to interconnect local noncommercial television stations and to procure, schedule, and distribute programming to them. Comprising around 350 member stations, PBS has functioned as one node in the U.S. public media ecosystem, though it frequently has been positioned as a synecdoche for the sector on whole. Over the course of its history, public affairs programming has been

central to the mission of U.S. public television; it was founded to offer clear expressions of American diversity, as a forum for debate, and to provide a voice for otherwise unheard groups. While PBS has played an important role in expanding the civic function of televisual journalism, it simultaneously has been limited by the structure and funding of the U.S. public media sector. This entry examines the creation of PBS, its role in the development of public affairs programming, funding for PBS, and PBS's status in the 21st century.

The Creation of PBS

In the 1950s, a nascent noncommercial television sector emerged in the United States. It was facilitated in part by the successful campaign of the Joint Committee on Educational Television to persuade the Federal Communications Commission (FCC) to set aside over 200 television frequencies for *noncommercial, educational* stations. It also was enabled by the largesse of the Ford Foundation, which funded national organizations to lobby for educational television, help local communities establish ETV stations, and distribute programming to stations.

Technical, logistical, and financial restraints limited how noncommercial television could address current affairs. National Educational Television (NET), an organization largely supported by the Ford Foundation, distributed programming to local stations. Throughout the 1950s and much of the 1960s, stations were not interconnected—they were not capable of simultaneously carrying the same programming—and received NET programming in staggered blocs; this distribution system undermined NET's ability to telecast on exigent issues. NET's public affairs programming instead focused on topics ignored by commercial television or provided greater depth and alternate perspectives than what viewers may have encountered in commercial media.

Local educational TV stations were heterogeneous and included stations created by state legislatures and run by state commissions, stations affiliated with school systems, stations run by university systems, and stations created by local community organizations. As NET sought to provide alternate perspectives, it faced hostility from some

of the local stations who anticipated that their local communities, or the entities that funded and controlled them, would see the programs as contrary to the local public interest. In addition, corporate underwriters for NET programming were reluctant to sponsor public affairs programming and preferred cultural affairs and science series.

By the mid-1960s, the future of noncommercial television seemed uncertain, especially given the financial instability that had defined the sector for over a decade. The Carnegie Commission on Educational Television formed in 1965 to study the problems of and map solutions for the U.S. noncommercial television sector. It suggested that the sector, which had been referred to as *educational television* be reconfigured as *public television*, a renaming that signaled both a core tenet of the commission's recommendations—that the federal government provide sustained financial support for the sector—and a reinvigorated vision of what noncommercial television could offer the U.S. public. The Carnegie Commission imagined in public television an alternative to commercial television; freed from the constraints of advertising, and thus freed from the reliance on ratings and on hailing a mass audience, public television was intended to take risks, address controversial topics, and expand the diversity of perspective available to television viewers.

The Carnegie Commission recommended a manufacturer's tax on television sets that would provide a dedicated funding stream insulated from political pressures. The Public Broadcasting Act (PBA), enacted in 1967, embraced the Carnegie Commission's recommendation with one important modification: Public broadcasting would receive federal support, but it would be allocated by Congress as part of the appropriations process. In so doing, Congress created the conditions by which the future of the sector could be compromised by its programming decisions, especially in the realm of public affairs.

The PBA created the CPB to disburse federal funds to local stations and to fund program production. The CPB created the PBS. PBS has been one element, by design, of a highly decentralized public television sector, one that has uneven control of nationally circulating programming especially in the realm of journalism and public affairs. The four primary constraints on PBS's public affairs

programming—the allocation process for federal support, the sector’s reliance on corporate underwriting, the centrality of viewer support to local station operations, and the diversity of the local stations themselves—were prefigured in the early history of noncommercial TV in the United States and cemented in the passage of the PBA. In addition, technological changes, such as the expansion of cable television and the rise of the Internet, along with the escalation of the culture wars in the United States, influenced how PBS approached its public affairs programming.

PBS and Public Affairs Programming

PBS does not produce the programming it circulates to local public television stations. Producing stations—such as WETA (Washington, D.C.), WGBH (Boston), WNET (New York), and WTTW (Chicago)—produce the majority of programs scheduled and circulated by PBS. PBS also secures programming from independent sources and international television services. Local stations round out their schedules with locally produced programming and with shows secured from other providers such as the Independent Television Service and American Public Television.

PBS’s signature news series, *PBS NewsHour*, premiered in 1975. Originally produced by WNET and entitled *The Robert MacNeil Report*, the program emerged from PBS’s widely praised coverage of the Senate Watergate Hearings. Journalists Robert MacNeil and Jim Lehrer anchored the coverage and provided around 5 min of context before each day’s testimony began; the hearings were telecast live and re-aired each evening. This coverage established public television as a crucial site of public affairs programming as it brought the extent of the criminality of the Richard Nixon White House daily into people’s living rooms.

After the success of their Watergate coverage, MacNeil and Lehrer in 1975 coanchored a half-hour nightly news program. The title of the program shifted across time—it became the *PBS NewsHour* in 2009—and it was expanded to an hour in 1983. The program has offered an overview of the day’s headlines, followed by three or four longer segments of in-depth discussions on the issues of the day; when the series first aired in

its 30-min format, it had dedicated its discussion period to one topic. This facet of the *NewsHour* extends a longstanding commitment within the noncommercial television sector to discussion and deliberation as central to unmasking and addressing social and political problems.

While, as discussed in greater detail later in this entry, public television long has been attacked for an alleged liberal bias, its flagship nightly news program has been critiqued for tacking to the right. Analyses of the *NewsHour* have identified how the program’s guests largely hail from government, think tanks, journalism, corporations, and the academy and comparatively rarely are drawn from local communities, advocacy organizations, or labor unions. Accordingly, while offering more substantive discussion of issues, the *NewsHour*, for its critics, has replicated an *elite bias* in news sourcing and has neglected to meaningfully offer diverse perspectives not heard on commercial outlets.

PBS’s other longstanding public affairs programs have included anthology documentary series and weekly news discussion programs. In 1983, PBS premiered *Frontline*, a series dedicated to long format public affairs documentaries. *Frontline* has been the only sustained broadcast series committed to public affairs and investigative documentary since the commercial networks jettisoned their prime-time documentary series (CBS *Reports*, NBC’s *White Paper*, and ABC’s *Close-Up*). *Washington Week*—formerly *Washington Week in Review*—since 1967 has provided weekly panel discussions, primarily by Washington-based journalists, on the key recent events.

Public Funding and Public Affairs

The first substantive existential threat to the public television sector happened within 5 years of the PBA. In 1972, Nixon vetoed the CPB’s authorization bill on the grounds that the public television sector had become too centralized. To many then and since, this issue of localism was seen to cloak Nixon’s antipathy toward public television’s public affairs programming, his animosity to journalists (such as Robert MacNeil, Sander Vanocur, Bill Moyers) perceived to be his political enemies, and his view that members of the CPB board were too liberal. Nixon ultimately signed an authorization bill in 1973, not coincidentally

after the chairman, president, and director of television for the CPB resigned.

The Nixon veto confirmed that the PBA had left the public television sector vulnerable to political pressures. In response, PBS and the CPB inaugurated a new system by which nationally circulating programming would be chosen: the Station Program Cooperative (SPC). The SPC empowered local stations to determine which programs PBS would distribute. The value of the process was in how it allowed stations to play a substantial role in determining the national schedule; the downside was that it privileged programs that were inexpensive, uncontroversial, or tried-and-true. The SPC was in place from 1974 until 1990.

Public funding was substantially decreased in the 1980s, the result of two intertwined developments. The expansion of cable television was imagined to obviate the need for public broadcasting, as it diversified the outlets, and ostensibly the perspectives, available to TV audiences. In addition, PBS programming about topics like the Vietnam War, the Iran–Contra scandal, and Israel provoked attacks that public television evinced a liberal bias that betrayed its commitment to serve the public on whole. While public television survived calls for its complete defunding, the Reagan administration decreased federal support and the sector moving forward was required to rely on other financial sources. In response, the CPB and PBS rejected programs critical of state and corporate actors, delivering public affairs programming characterized as “safely splendid” and “blandly grand.”

The decrease in federal funding pushed PBS to rely even more on corporate underwriting. This move was facilitated by a 1984 FCC order that allowed for *enhanced underwriting* on public broadcasting stations. Enhanced underwriting allowed stations to provide on-air information about their underwriters, save explicit promotion of their goods and services or comparative claims about their value, and accordingly made underwriting more attractive to underwriters than the brief on-air identifications of support that previously had been permitted.

Challenges to PBS resurfaced again in the 1990s, when conservative leaders in Congress fought to defund public broadcasting, drawing on similar arguments about liberal bias—especially centered on programs about homosexuality—and

redundancy. While this effort did not succeed, the 1992 appropriations bill for the CPB included a provision that required the CPB to review public affairs programs to assure they adhered to objectivity and balance. This provision again put PBS on notice that its treatment of controversy would be central to future federal support and discouraged it from taking risks in its presentation of alternate viewpoints.

Threats to cut off federal funding for public television continued on into the 21st century. In 2005, the House Appropriations Labor, Health and Human Services Subcommittee voted to defund public media on the recommendation of CPB chairperson Kenneth Tomlinson for analogous reasons as were raised in the 1990s. Republican presidential candidate Mitt Romney in 2012 called for the privatization of public media, arguing that it was an inessential expense that increased the nation’s unsustainable debt. President Donald Trump in 2017 and 2018 proposed budgets that would have eliminated funding for public media, though Congress refrained from enacting the cuts.

PBS Today

For decades, criticisms of public television have hinged on five complaints: accusations of ideological bias in programming, assertions of its redundancy in an era of media abundance, allegations that it serves primarily an elite audience, anxieties that its funding sources (especially corporate underwriting, private foundation grants, and viewer donations) have undermined its public service mission, and contentions that its lack of racial diversity in personnel, programming, and perspective similarly have undermined this mission. These concerns have endured yet shifted in the 21st century. Underwriting scandals between 2012 and 2014—PBS, for example, had created a multipart series on the U.S. economy that aligned with the business interests of corporate underwriter Dow Chemical, a series lambasting the problems of public employee pensions funded by a billionaire who had lobbied against public pensions, and a program about drones underwritten by a drone manufacturer—accelerated concerns over how the financing of PBS compromised its function as public media.

Yet, PBS also has persevered and capably adapted to an increasingly partisan media ecosystem and to the affordances of digital media. The emphasis on deliberation and discussion in its flagship public affairs programs distinguish it as a trusted news source for audiences across the political spectrum. Its cultivation of multimedia websites—inclusive of blog posts, video, and podcasts—also has extended its capacity to offer in-depth discussion of current events and to expand the audience for its news programming. As Michele Hilmes (2018) has noted, PBS has developed into a *quality* media brand that, along with decades experience in navigating and uncertain financial future, has rendered it well-poised to persist in an ever-changing media environment. If hailing a *quality* audience in the 20th century had provoked accusations that PBS did not serve the public on whole, in the 21st century, it may be the key to its resilience in a variegated media ecosystem.

PUBLIC FUNDING

Public funding constitutes financial support for journalism that comes from a government entity. Public money can support journalism directly or indirectly. Because independence from government is a valued element of journalism, the extent to which government financially supports journalism has been more controversial than other forms of funding for media such as advertising, underwriting, reader support, or philanthropy. This entry discusses public funding for journalism in the United States and the debate surrounding its efficacy.

The First Amendment to the U.S. Constitution, which includes the wording “Congress shall make

no law . . . abridging the freedom of speech, or of the press,” sets up some protection for journalism from government, and journalists in the United States are expected to act as a check on government. A major function of the press is holding the government accountable.

Because of this, opinions among U.S. journalists differ about the extent to which public funding should support what they do or whether it should support it at all. Some have argued public funding compromises the ability for journalists to act independently of government; others have argued it can provide necessary financial support for journalism while safeguarding editorial independence.

History of Public Funding of U.S. Journalism

The United States has a history of subsidizing journalism in various ways. In the 1700s, colonial newspaper printers survived because of government contracts and would act as official printers for a municipality. The U.S. Postal Act of 1792 offered discounted rates for newspapers and allowed printers to exchange them for free. The U.S. government contracted roughly all its printing to newspaper publishers, often doling out contracts as political favors, until Congress in 1860 created the U.S. Government Printing Office. Through much of the 19th century, plenty of American journalists were either directly on the government payroll or had sideline patronage jobs working as political party operatives. Public money kept the presses running.

A gradual move away from a linkage between government and the press began in the 1830s as commercial for-profit media bloomed, particularly in larger cities. As the “penny press” in New York City took off, newspapers moved away from alliances with government as commercial advertising dollars fueled newspapers that no longer had to rely on political parties for support.

There was never a complete break, however, from government support for some journalism in the United States, particularly as news mediums continued to evolve. During World War I, the federal government took the unprecedented step of funding and running a daily newspaper called *Official Bulletin*. Published out of the News Division of President Woodrow Wilson’s Committee

on Public Information, the newspaper appeared in government offices, post offices, and military installations until the end of the war.

Publicly Funded Journalism Entities in the United States

During World War II, the U.S. government launched Voice of America (VOA), a radio news operation broadcast overseas to combat Nazi propaganda. In 2019, the federal Broadcasting Board of Governors requested \$661.1 million from Congress that year to fund its operations. The government entity, which calls itself “America’s civilian international media agency,” oversees VOA, Radio Free Europe, Radio Free Asia, and others. When President Gerald Ford in 1976 signed the VOA’s charter into law, the charter stated the broadcast operation would be “accurate, objective, and comprehensive.” In 2016, Congress stated the Inspector General of the U.S. State Department and Foreign Service shall “respect the journalistic integrity of all the broadcasters.”

Whether VOA operates in practice without political pressure or to the highest forms of journalistic independence has made for plenty of debate. One correspondent who spent 35 years at VOA said in 2017 such media were funded by taxpayers to support an agenda.

Following the advent of television, President Lyndon B. Johnson in 1967 signed the Public Broadcasting Act, creating the private nonprofit Corporation for Public Broadcasting (CPB). In public remarks at the time, he said while the CPB would get part of its support “from our government,” it would be independent, “carefully guarded” from government or party control. The CPB created the well-regarded National Public Radio (NPR) and Public Broadcasting System (PBS).

NPR and PBS do not rely entirely on government support. While the outlets receive money from the U.S. Treasury, through the CPB, they also raise money from listeners and viewers, and from corporate underwriting and philanthropic foundations.

In 2020, Congress approved \$465 million for the CPB, a minuscule portion of the federal budget that helped support more than 1,500 local public radio and TV stations that year. In 2017, 36 states provided public funding for broadcast media, and the percentages of public funding by state differed

considerably. Public funding made up more than half the revenue budgets of some local stations. Some conservative politicians have pushed to defund NPR and PBS for reasons ranging from cries of bias to wasteful spending. In 2012, public funds made up about 15% of PBS's budget. In 2020, NPR stated grants from the CPB and federal agencies and departments made up less than 1% of its annual operating budget on average.

Governments have supported media indirectly as well. In 1970, Congress passed the Newspaper Preservation Act, which allowed for a special exemption in antitrust laws for newspapers to enter into joint operating agreements with competing publications.

Some states offer tax breaks for printing ink or newsprint. States also have laws mandating certain public notices about important information like public meetings, government contracts, or unclaimed property appear in a local print newspaper. Smaller newspapers in particular rely heavily on the notices to stay afloat financially. In the digital age, newspaper publishers have had to lobby state lawmakers and fight to keep those laws on the books to prevent losing a revenue stream. Public schools and universities can financially support student journalism.

Shifts in Thinking on Public Funding for U.S. Journalism

Still, government support for media in the United States is less robust compared to some other countries such as Germany, Finland, and the United Kingdom, and news outlets funded by the government are outliers in the broader U.S. media ecosystem. For the better part of the 20th century, when a traditional advertising model was working well, particularly for local news publishers, many of those who produced the news in the United States likely would not have advocated expanding public-sector support and might have been repelled by the prospect.

Following the rise of the Internet at the turn of the 21st century and the Great Recession of the early 2000s, when the bottom fell out of the local news business model, public discussion bubbled up among U.S. journalists and those who advocate for journalism about the viability of expanding public funding to support local news. The

discussions came at a time of great disruption for local news publishers. Layoffs had lashed the industry. Publications went out of business. Studies showed a diminished local news scene was bad for democracy.

Local news was too important to disappear, believed some who began to rethink their aversion toward publicly funding journalism in the United States. In 2014, a North Carolina city government gave a \$100,000 low-interest loan to help expand a newspaper that focused on the Black community. That same year, a local government in Wisconsin offered a \$30,000 payment to a small local newspaper, so it wouldn't shut down. Some advocating for more public support for local news proposed creating state or national public media funds to administer money to publishers, forming entities called *Community Information Districts* funded by local taxpayers, or using local library district taxes to produce journalism, among various other possibilities.

As financial cutbacks in the local news industry continued through the first quarter of the 21st century, some who previously might not have entertained the idea of expanding public funding for journalism became more open to it—if it could be done in a way that protected publishers from undue influence. They included well-regarded academics, journalism historians, a former chairman of the Pulitzer Prize Board, and at least one First Amendment attorney. Some argued that if news publishers were able to establish adequate editorial firewalls to protect journalism from the influence of corporate advertisers or philanthropic donors—not that they always did—they could do the same if some revenue came from a government entity. Government has funded important science research without intrusion, some said, and the government has long funded arts and humanities.

In 2018, New Jersey lawmakers approved a bipartisan measure that created a nonprofit organization, the first in the nation, that would invest public funds to bolster local news coverage. In 2020, for the first time ever, the Colorado Office of Economic Development & International Trade offered a \$100,000 grant opportunity to a local news publisher.

As COVID-19 spread across the world and was declared a pandemic in early 2020, it prompted business shutdowns that further devastated

advertising revenue for many news organizations, and some publishers accepted government support via the Paycheck Protection Program administered by the U.S. Small Business Administration, so they could continue to create journalism. Others argued newspapers have a core function of covering government and couldn't reconcile that with accepting taxpayer money. If anything, the pandemic further galvanized a contentious debate over the efficacy of public funding for news in the United States.

PUBLIC RADIO JOURNALISM

American public radio journalism consists of the news and public affairs programs that can be heard on noncommercial radio stations and includes a variety of formats, from news magazines to public affairs programs to listener call-in programs. At a

time when commercial radio's news content is generally limited to brief newscasts, public radio offers listeners a wide range of news, analysis, and discussion. Public radio journalism offers greater variety and depth than is typically provided on commercial stations, covering not only breaking news but also science and the arts.

The main producers of such programming historically have been National Public Radio (NPR), Public Radio International (PRI), American Public Media (APM), and Pacifica Broadcasting. In recent years, more programs are also being produced by several local public radio stations and independent radio producers, some of these in collaboration with NPR and PRI. Podcasting has opened a new avenue for distributing public radio's journalism programs and has brought in new producers and new audiences. This entry first discusses the history of public radio broadcasting in the United States and gives some examples of news programming and coverage of the arts, culture, and the environment. It then looks at public radio programs featuring narrative journalism, collaborations among stations to strengthen regional coverage, the use of podcasts and social media, and public radio funding.

History

NPR, which came into existence as a result of the Public Broadcasting Act of 1967, started broadcasting in 1971 and is a major producer of news programming on public radio. APM, launched in 2004, is the second-largest producer of public radio news, culture, and music programs. APM is the name under which Minnesota Public Radio produces and distributes programs nationally.

Originally known as *American Public Radio*, PRI was founded in 1983 as a way to distribute programs from public radio stations around the country and to diversify offerings on public radio stations. In 1994, its name was changed to Public Radio International (PRI) to reflect its mission of bringing a more global perspective to the airwaves. It has established partnerships with the BBC, Canadian Broadcasting Corporation, and *The New York Times* to fulfill its goal of bringing different perspectives to public radio. In 2012, it was acquired by WGBH Boston and in 2018 it merged with PRX, another producer and distributor of audio journalism.

Pacifica Broadcasting was founded in San Francisco in 1949 by Lewis Kimball Hill, a pacifist who saw community radio as a place to begin a dialogue about the betterment of society. The Pacifica Network consists of five radio stations in New York, Los Angeles, Berkeley, Houston, and Washington, D.C., as well as many independent public radio stations that are affiliates. Its goal was to give voice to those without power and to become a place for progressive viewpoints that questioned the status quo with regard to political discourse, art, and culture. However, ongoing problems with governance and finances have undermined Pacifica's presence in the public radio journalism sphere.

News Programming

News magazines are an especially important part of public radio journalism. NPR's flagship news magazines are the late weekday afternoon *All Things Considered* and the similar but earlier *Morning Edition* and *Weekend Edition*. *All Things Considered* (ATC) was created in 1971 as a news program designed to be distinctly different from what commercial radio had to offer and that embodied the NPR mission of celebrating the variety of human experience. The format has evolved over the years and become more structured. ATC starts off with headlines on the hour followed by longer stories with in-depth reporting. This long-form journalism is characteristic of public radio as is its ability to explain complex issues, take unusual angles on news stories, and offer news with a global reach that makes for a greater breadth of coverage.

Recognizing that it needed a news program during morning drive time, NPR added *Morning Edition* in 1979. Introduced 8 years after ATC, *Morning Edition* was far more a product of audience research than had been the case with ATC, with information about audience listening behavior shaping the structure of the program. The program was designed without a clear beginning, middle, or end, an approach that allowed listeners to tune in and out of it depending on their morning routines. The segments were shorter than on ATC, with frequent opportunities for member stations to broadcast the local weather, news, and other announcements.

Weekend Edition (Saturday), hosted by Scott Simon, went on the air in 1985 and was followed by a Sunday version a year later. The program distinguished itself from the weekday news magazines with narrative features that combined natural sound with storytelling and commentary on the week's events that extended to sports and entertainment. NPR also produces programs in collaboration with public radio stations. One such example is *Here and Now* produced with WGBH Boston.

Although its original mission saw NPR being more of an alternative news source to commercial media with a focus on analysis and commentary rather than breaking news, over the years its role has evolved to being a primary news source. This means that there is a greater emphasis on covering all major news events and being on the spot when news breaks. After the attacks of September 11, 2001, for the first time, the network reported round-the-clock for a record 90 hours (nearly 4 days). Such live coverage is something NPR has continued to do, covering important Senate hearings, confirmation hearings for Supreme Court justices, and presidential debates.

As the amount of news on commercial radio has declined, especially with the increase in media consolidation after the Telecommunications Act of 1996, public radio has filled this void. Public radio defines journalism in a broader sense, going beyond hard news to feature a breadth of coverage similar to that of newspaper journalism. With newspaper closures and cutbacks at many remaining newspapers since the 2008 recession, public radio journalism plays a critical role by bringing to light abuses of power and making audiences aware of a range of issues that are not being covered elsewhere.

Starting in 2000, NPR has expanded its overseas bureaus in order to cover breaking news around the world at a time when most news organizations were closing their overseas bureaus because of declining revenues. In the early 2000s, NPR began to move toward establishing an online presence and training its journalists to produce stories for digital platforms. Funding for this initiative came from the Kroc bequest and later from the Knight Foundation.

Other public radio entities also provide news programming. In 1996, PRI launched its news and public affairs program, *The World*, designed to

compete directly with *All Things Considered*. PRI's first venture into program production, *The World* is coproduced by the BBC World Service and public radio station WGBH in Boston. As its name suggests, the program has an international focus and features a mix of news, interviews, and music from around the globe. In 2008, PRI added to the morning drive time news options with *The Takeaway*, a show that has a distinctive conversational style.

Democracy Now is a 1-hour current events program that first aired on Pacifica stations in 1996 and is now produced by an independent production company. The newscast covers stories that rarely achieve attention on commercial radio and even on other public radio stations and are in keeping with its mission of promoting peace and social justice.

Listener call-in shows, a staple of commercial talk radio, have also found a place on public radio, but the similarity ends there. The nationally distributed call-in program *Talk of the Nation* demonstrated that such offerings could be educational and informative and a forum for discussion, rather than the often-contentious ranting of commercial radio's largely right-wing hosts. That show ended its run in 2013, but *On Point*, produced by WBUR Boston and syndicated by NPR, continues the call-in genre of programming.

Marketplace, a 30-minute business program, is an example of how public radio has taken what many see as a dry and boring topic and put its unique stamp on it. To begin with, the program originates in Los Angeles, away from the East Coast business centers. And rather than focusing on the "numbers" (i.e., the performance of stock indices), it looks at the world through the lens of business, economics, and finance. This approach results in stories that often go beyond the typical business narrative and thus appeal to a wider audience. Sample features on the program in 2020 included stories about how much money people have on gift cards, how the novel coronavirus was impacting U.S. businesses, and the role of the Screen Actors Guild in assisting actors on and off stage.

Public radio also shows that news can be a source of comedy and humor. Weekly NPR quiz shows *Wait, Wait, Don't Tell Me*, hosted by Peter Sagal, and *Ask Me Another*, hosted by Ophira Eisenberg, mix humor and information and are performed before live audiences (with the exception of

shows broadcast beginning in late March 2020, due to the COVID-19 pandemic), giving them an opportunity to interact with the hosts.

Coverage of the Arts and Culture

While the arts are covered regularly in segments on public radio news magazines, there are also programs such as NPR's *Fresh Air* that often go into greater depth on this subject. *Fresh Air*, produced by public radio station WHYY in Philadelphia, has been available nationally since 1985. Host Terry Gross's interviews with writers, musicians, artists, journalists, and politicians are distinguished by the amount of preparation and research that goes into each of them to give listeners unusual insights into their personalities and a sense of who the subjects are as individuals.

Studio 360 was made available nationally to public radio audiences starting in 2001. Hosted by Kurt Andersen, the show was produced by New York's WNYC and distributed by PRI. It combines artist interviews with features that allow reporters to speak in the first person and draw on personal experiences to examine concepts in high and low cultures. Each program was built around a chosen theme; themes have ranged from girl culture to loneliness, to youth, to locations of popular television series. The program ended in 2020 after 20 years on the air.

In the realm of culture, public radio also has programs that are built around a single subject. *On Being*, which started as *Speaking of Faith*, is an hour-long program that explores questions of spirituality, healing, science, and the arts. It is produced and distributed by PRI and has been available nationally since 2001. In an interview in 2004, host Krista Tippett said her goal is "to trace the line between theology and human experience," through conversations that explore how individuals struggle to resolve the moral and ethical questions in their religion. A sampling of show titles indicates the breadth of topics covered that ranged from "How We're Wired for Goodness," "The Evolutionary Power of Children and Teenagers," to "A New Imagination of Prayer."

The Splendid Table, an hour-long weekly program produced and distributed by APM, explores the place of food in American life. While recipes are a part of its appeal, the discussions about food

provide a means to examine culinary traditions in the United States and other cultures. Originally hosted by Lynne Rossetto Kasper from 1997 to 2017, it is currently hosted by Francis Lam. Lam often invites luminaries from the world of cooking to share their perspectives and memories about food and cooking.

On the Media, another weekly hour-long show produced by WNYC and distributed by NPR, examines the culture of the media. A large part of its focus is on how news is made and how journalism is practiced by news organizations, including public radio and First Amendment issues. Co-host Brooke Gladstone said in an interview that the goal of the program was to explore advertising, television, movie trends, and look at “where media and culture collide, where media holds up the mirror to culture” in order to “show how the media sausage is made” (Transom, 2004).

Coverage of the Environment

Public radio journalism encompasses subjects rarely addressed on commercial radio, including science and the environment. NPR’s *Science Friday* is a weekly science talk presentation broadcast live that focuses on science topics that are in the news. Host Ira Flatow is joined by experts for a discussion on topics related to science, technology, health, and the environment. Listeners have an opportunity to call in with questions. Flatow says his goal is to make issues in science accessible to his listeners.

PRI’s weekly show *Living on Earth* reviews how culture, economics, and technology shape the world around us. Host Steve Curwood invites experts to explore a broad range of topics, many of which relate to the impact of climate change such as Norway’s vanishing winter and the environmental consequences of fracking. Curwood says the show is about people’s relationship with nature and does not seek to tell listeners what to do, but rather seeks to provide information.

Narrative Journalism

Public radio has broadened its definition of journalism to make room for individual narratives that find a place in radio documentaries and on news magazines such as *ATC* and *Morning Edition*. The public radio program that is credited with making

the personal narrative hip was *This American Life*, hosted by Ira Glass. First aired in 1995, the show features the stories of real people told in their own voices. Each show is built around a single theme that is explored through narratives of different individuals in compelling, dramatic, and often comic situations that are often also emotionally moving.

The idea that “people” stories can be interesting is the basis for David Isay’s *StoryCorps* project launched in 2003 and Jay Allison’s *This I Believe*, which aired from 2005 to 2009. *StoryCorps* gives ordinary people an opportunity to record their stories. The first booth where stories could be recorded was set up in New York City’s Grand Central Station in October 2003; in 2005, two Airstream trailers—traveling recording studios called *MobileBooths*—were launched to record stories told by people across the country. A small portion of these stories are edited down and then featured on *Morning Edition*. According to Isay, the idea that people matter and that they won’t be overlooked drives the project.

Based on a 1950s series by the same name hosted by Edward R. Murrow, *This I Believe* invited people—some famous, but many not famous—to share the core values and beliefs that guide their lives with the hope that listeners would develop respect for values different from their own. While the well-known were invited to participate in the program, the rest volunteered themselves using the guidelines on the program website to write their essays. These first-person 3-minute audio essays were carried on both *ATC* and *Weekend Edition*.

A less heard and perhaps less clearly identified format that has a place on public radio is the documentary. APM Reports (formerly American RadioWorks) produces documentaries that are carried on a variety of public radio programs. These documentaries explore topics such as the role of social media, technology companies, government institutions, and education.

Regional Collaborations

One way that public radio journalism is being strengthened is through station collaborations. In the late 1990s, six stations in the Pacific Northwest came together to form the Northwest News Network. While some of the original stations have dropped out of the collaboration, there are seven

primary partners with other stations that join in occasionally.

In 2017, the Corporation for Public Broadcasting (CPB) launched the Mountain West Journalism Collaborative that brings together six stations in Colorado, Wyoming, Idaho, Utah, and Montana. The goal is for these stations to produce local stories that could be shared regionally and pitched to NPR for reaching national audiences.

NPR's Collaborative Journalism Network launched with a collaboration anchored by four of the largest Texas public radio stations in Dallas, Houston, San Antonio, and Austin. The collaboration started with six daily newscasts statewide that drew on news stories from large and small stations across the state. In addition, in-depth reporting carried by the Austin public radio station is shared with NPR member stations across the state.

A similar collaboration was set up in California to "increase coverage of statewide issues and to boost reporting from and for underserved areas in the state" (NPR, 2020). The goal is to eventually get all stations in the state to participate and to help counter news deserts that have formed as local newspapers shut down.

The Gulf States newsroom collaboration covers stations in three states—Mississippi, Alabama, and Louisiana—and is supported by both the CPB and NPR. Like the California collaborative, it aims to counter news deserts and contribute to a better-informed citizenry.

Both NPR and CPB see these collaborations as a way to support local journalism at a time when many local newspapers are shutting down.

New Platforms Expand Audience Reach

The growing popularity of podcasts has benefited existing public radio organizations such as NPR while offering a platform for independent producers to reach audiences. In 2020, eight of the top 20 podcasts ranked by Podtrac were produced by NPR including *NPR News Now*, *Up First*, and *Hidden Brain*. *This American Life* (produced by WBEZ Chicago and distributed by PRX) ranks among the most downloaded podcasts of all time.

Serial, produced by *This American Life* and launched in 2014, is an example of investigative journalism in a serialized audio narrative. The first

season investigated the 1999 murder of a student at a Baltimore high school. Season 2 focused on an American soldier, Bowe Bergdahl, who was held by the Taliban for 5 years and later charged with desertion. *Serial* became the first podcast to win a Peabody award and with over 340 million downloads of Seasons 1 and 2 set a world record.

The Center for Investigative Reporting (CIR) whose stories had been featured in a variety of news outlets—print and television—launched its first radio show and podcast, *Reveal* in 2013. News stories fall into three broad categories—inequality, sustainability, and accountability. Additionally, it launched a serialized investigation, *American Rehab*. *American Rehab* examined rehab programs that were turning those coming to them for treatment into an unpaid labor force. *Reveal* maintains an active presence on social media platforms such as Facebook and Twitter and uses its website to post multimedia content.

Funding

Financial support for public radio journalism comes from many sources and varies for different public radio entities. NPR receives funding from Congress by way of CPB, from corporate underwriters, from member stations (whose fees for programs are based on their audience size), and from foundations. PRI's main source of funding is station fees, corporate underwriting of program series, and support from foundations; it also solicits support from listeners. Pacifica Radio relies primarily on support from its listeners and is the only public radio entity that does not accept corporate underwriting.

As funding from the CPB has declined, corporate underwriting and support from foundations have become particularly important for both NPR, APM, and PRI. All of them have received funding from foundations such as the Gates Foundation, the McArthur Foundation, and the Knight Foundation, among others. Dependence on these sources of funding has raised questions about the influence of these entities on the journalism practiced by public radio and the limits such funding might place on investigative reporting on public radio. There is also concern that foundations can buy coverage in their area of interest.

PUBLIC RELATIONS

Modern public relations emerged in the early 20th century as a response to the expanding role of mass communication in mobilizing and influencing public opinion. Several factors, such as Progressive Era political, social, and moral reforms and government war propaganda, combined to institutionalize and normalize the act of influencing and changing public opinion. After more than a century, public relations has evolved

into a profession that includes public affairs, crisis communication, issues and reputation management, lobbying, investor relations, media relations, community relations, social media management, and corporate communication. The definition of public relations also has changed over the years from making things known and relations with the public to strategically building and managing mutually beneficial relationships with publics critical to organizational success. Every organization, whether for-profit or not-for-profit, uses some form of public relations to navigate its social and professional relationships.

This entry defines public relations and explores its growth as an industry, its impact on individuals and organizations, and its expanded reach in the 21st century.

Defining Public Relations

As Ronn Torrosian, founder and CEO of 5W Public Relations, has said, public relations combines a variety of disciplines, including journalism, psychology, and law, and stays interesting while continually changing. Torrosian's definition coincidentally reflects the philosophy of public relations icon Edward Bernays, a onetime journalist and nephew of Sigmund Freud. In the 1920s, publicity was associated with journalism and persuading journalists to provide news coverage of the publicist's clients or employers. In promoting the new field of public relations, Bernays drew from psychology to emphasize the importance of knowing and understanding public opinion and attitudes. He then looked to the legal profession for the right metaphors to describe public relations practitioners as counselors advocating on behalf of their clients in the court of public opinion. As the most prolific spokesperson for the new profession, Bernays resisted using the more common term of publicity and instead promoted public relations as the preferred *nom de guerre*.

The concept of publicity or the act of making things known to the public had been around since the 1800s. Publicists relied on mass communication to reach the public and judged the success of their efforts by the number of newspaper and magazine articles written about their clients and special events. After World War I, however, the success of the Office of War Information's propaganda campaigns gave publicity a bad name and

associated it with such pejorative terms as propaganda, disinformation, and deception. Journalists condemned publicists and press agents for manipulating the news processes in a concerted effort to win positive news coverage for partisan corporate, governmental, and nonprofit interests. Even today, publicity, despite its pervasiveness in public relations practice, is considered somewhat of a dark art, a less respectable aspect of the field. Public relations practitioners and educators have continued to distance themselves from publicity and propaganda by emphasizing the management function of communication and public engagement.

This rebranding served the self-interests of professional publicists. It expanded definition of public relations to include services beyond the mere pleading for media attention and coverage. It allowed publicists, such as Ivy Lee and Bernays, to market themselves as public information counselors, mediating between organizations and the public. The captains of industry began relying on public relations counselors to rehabilitate reputations damaged by overly aggressive reporters and policy makers. Public relations helped corporate leaders shed their image as greedy, public-betrayed empire builders by rebranding them as civic leaders and philanthropists. Practitioners proved their value by advising corporate leaders on overall communication strategies that served the public interest. By the 1930s and 1940s, major corporations depended on public relations to win back public support lost during the Great Depression. Practitioners served as quasi corporate journalists, counseling executives as to the nature of public attitudes and opinions while at the same time providing the public with information about organizational leaders, operations, and values.

The Growth of Public Relations as an Industry

As practitioners mediated between organizations and the public, they began placing more emphasis on tapping into public attitudes and addressing public concerns. Public relations helped organizations adapt their messages to align with the needs and interests of the public. Scholars would later interpret these efforts to survey and understand public attitudes and opinion as asymmetric

communication or seeking public input so as to design better, more persuasive messages. That interpretation, however, fails to appreciate sincere attempts by public relations practitioners to know the public mind and use that knowledge to help organizations reconcile their values and interests with those of the public. Indeed, Denny Griswold, publisher of *Public Relations News*, defined public relations as a function of management that monitors and interprets public opinion and attitudes while aligning organizational policies with the public interest. Griswold added that public relations' purpose was to help the public understand and accept an organization's plans and activities. Of course, a favorable public image allowed organizations the space necessary to operate without public or political scrutiny. By counseling management on how to promote a positive public image, public relations managers increased their influence over the organization's dominant coalition and bargained for a seat at the management table.

A natural outgrowth of independent corporate communication counseling was the founding of public relations agencies. In 1927, John W. Hill helped establish one of the most successful public relations firms in Cleveland, Ohio. Hill & Knowlton remains one of the leading global public relations agencies with more than 80 offices worldwide. From the outset, Hill defined public relations as disseminating information about clients and educating the public about big business. Although he emphasized publicity, Hill was more concerned about aligning the attitudes and opinions of management with those of the public. In helping management understand the public, Hill perceived the role of public relations as the organization's conscience. In other words, practitioners' knowledge of public attitudes and opinion allowed them to advocate for the public inside organizations. They reminded management of the organization's social responsibility. Although public relations disseminated information necessary for the public to make decisions, it also monitored the public mind so as to help management recognize its social responsibilities. Practitioners echoed Hill's philosophy when they defined public relations as synonymous with the public interest because it acted as the public conscience for an organization.

These evolving definitions often referred to public relations role in shaping and influencing both the public perceptions of an organization and the organization's perceptions of the public. Other definitions emphasized the promotion of good will between an organization and its various publics, including employees, community members, civic leaders, and customers. As the word *image* gained more of a negative connotation, public relations began emphasizing the need to manage an organization's reputation rather than its image. Reputation better reflected the sum total of an organization's history, identity, and character. It encompassed more than a slick public image; it symbolized organizational actions, processes, and purposes. Dealing with the public image and reputation of an organization demanded a higher level of strategic expertise than simply writing press releases and talking to journalists. It required research, planning, and strategy. Even today, reputation management represents a critical function of public relations practice.

Public Relations for Organizations

Positive media coverage plays a big role in managing the reputation of an organization. Although the media have changed dramatically since the beginning of contemporary public relations, winning positive news and feature coverage of one organization remains an important goal for public relations practice. Newspapers and magazines dominated the Progressive Era and continued to be a key vehicle for reaching the public up until the 1990s, when the Internet began to disrupt traditional media channels. Press releases and media advisories go out to newspapers, magazines, radio stations, television networks and stations as well as online news sites and influencers. National public relations conferences and webinars devoted to media relations continue to draw large crowds of practitioners hoping for placements in *The New York Times* and the *Atlantic* or on *60 Minutes* and *All Things Considered*. Although a major part of public relations practice, media relations has rarely showed up in definitions of public relations. Instead, the media are channels in which organizations fulfill their democratic obligation to keep the public informed while at the same time serving to win public support for organizational

actions. The media help to cultivate and maintain public acceptance and support.

Managing media relations also plays a critical role in crisis communication. Since the Tylenol drug-tampering murders in the 1980s, public relations has counseled organizations on planning for, responding to, and recovering from crises, both those of their own making and those for which they are a victim. Crisis communication, especially in the age of social media, has become one of the most popular services offered by public relations agencies. It also has captured the interest of communication scholars and has developed into one of the most popular lines of research in the field. Most universities with public relations programs offer courses in crisis communication. Nearly 40 years have passed since the Tylenol crisis, but the basic formula for crisis communication remains essentially the same: acknowledge the crisis, apologize or take responsibility for one's part in the crisis, work with public officials to solve the crisis, and institute processes and changes to minimize the possibility of the crisis occurring again.

Even absent a crisis, it is critical that organizations get credit for the good things they do. The community relations function of public relations has been expanded to include corporate social responsibility (CSR). Public relations has become so integrated into CSR efforts that some observers argue that public relations embodies an organization's responsibility to the public. As part of that responsibility, public relations does more than simply inform the public; it engages in two-way communication with the public. As far back as the 1930s, public relations practitioner and professor Rex Harlow advocated the need for practitioners to establish mutual lines of communication between organizations and the public. In a professional and academic career that extended into the 1970s, Harlow promoted the concept of two-way communication in which management listened and adapted to public feedback and opinion. He emphasized social science research and ethical communication practices.

James Grunig and Todd Hunt formalized the concept of two-way communication with the introduction of the Excellence model of public relations. They argued that the ideal form of public relations emphasized two-way symmetric communication or communicative interactions in

which organizations and publics adjusted and adapted to each other. This emphasis on two-way symmetric communication contrasted with two-way asymmetric communication used to simply better persuade the other party. Public relations practitioners and scholars had long emphasized management, but in the 1980s, they began aligning management with the concept of public relationships. Scott Cutlip, Allen Center, and Glen M. Broom, authors of the introductory public relations textbook *Effective Public Relations*, coined a definition of public relations that placed the management function at the forefront. Public relations' management function was to identify, establish, and maintain mutually beneficial relationships, especially with those publics upon which the organization depended for its success.

Public Relations as Professional Practice

In the last two decades of the 20th century, public relations embraced the concept of managing relationships as central to professional practice. The concept has been further refined as managing organization–public relationships. While two-way symmetric communication continues to influence scholarship and practice, there is now a competing line of research emphasizing dialogue. Michael Kent and Maureen Taylor have rebranded public relations as relational dialogue, with the idea of creating conditions in which organizations engage in the type of give-and-take dialogue that strengthens and maintains healthy relationships, particularly mutually beneficial relationships.

In 2012, the Public Relations Society of America (PRSA) invited members and the public to vote on three potential definitions of public relations. The definitions chosen focused on public relations as a strategic communication process that builds relationships between organizations and the public in a mutually beneficial manner. Ironically, the new definition sounded a lot like definitions that had existed long before the Internet era. Indeed, the definition sounded a lot like the one Cutlip, Center, and Broom introduced in the 1985 edition of *Effective Public Relations*. Canadian practitioners adopted a similar definition a few years before PRSA did. The Canadians added the adjective *strategic* to public relations and also included

strategic as a modifier for managing relationships between organizations and various publics with the such objectives as using communication, seeking mutual understanding, achieving organizational goals, and serving the public interest. Some practitioners questioned the inclusion of the public interest, calling it public relations for public relations. Neither of these definitions mentions interactivity or two-way communication, which have been promoted as key components of public relations in the digital age. If public relations described practitioners' artistic and scientific approach to engaging with people, as the public relations philosopher G. Edward Pendray said in the 1970s, the field has now become the art and science of mediated communication through social media, websites, and owned media. The envisioned relationships are more virtual than real, and the mutuality of those relationships may depend on the number of likes, shares, or stars.

In reality, public relations is the strategic management of communication that humanizes organizations in such a way that they can attract other human beings to interact and engage with the people who populate those organizations and the purposes, products, and activities of those organizations. Public relations is a human endeavor. It represents the humanity of an organization by translating what it is, what it does, and what it means to other humans and human organizations. The challenge remains the same as it has been since public relations emerged as a new profession in the first half of the 20th century. Organizations, the media, technology, and society are undergoing constant change. For public relations to adapt it must somehow retain its soul as a human activity in the midst of a monolithic mediated environment. As the focus shifts from earned media to owned media and even paid media, particularly on social sites, public relations could be subsumed by marketing, social media management, analytics, and big data.

In the meantime, public relations continues to prosper. In 2021, the PRSA boasts 30,000 professional and student members, 110 chapters, 14 professional interest sections, and 375 student chapters. PRSA is part of the International Public Relations Association, a global network of public relations associations. Despite a significant drop in demand for education in journalism and to a lesser extent, advertising, the demand for public relations

courses and programs continues to rise. In recent years, there have been as many as 100 openings for public relations educators. The Bureau of Labor Statistics estimated in 2018 that the number of public relations specialists to total 270,000 and grow by 6%, with a median annual wage of \$60,000. Public relations graduates fill key positions in a variety of fields, including research, strategic communication, and digital content creation. Public relations agencies experienced banner years in 2018 and 2019, with the global public relations industry (agencies) employing 94,000 and generating more than \$16 billion in revenues.

Whether public relations is defined as strategically making things known, managing relationships, or reputation management, it remains ever changing and interesting. Public relations humanizes organizations by giving them a personal voice that communicates the organization's purposes, practices, and values. In the digital age, the need for organizations to relate and interact with public is more important than ever. Public relations instills human attributes in organizational communication that allows the public to relate with organizations and develop relationships with organizations. As public relations cultivates and strengthens those relationships, it establishes a communicative environment in which the organization can influence and be influenced by the people upon which it depends for its success.

PUBLIC RELATIONS, ETHICS IN

As a subdiscipline, public relations (PR) ethics focuses on questions of moral rights and wrongs as they relate to PR professionals and scholars. As such, PR ethics necessarily stretches across disciplines. On the one hand, scholars focus on the practice and theory of PR. This includes an understanding of the day-to-day activities of professionals working in various sectors (e.g., agency, corporate, nonprofit, government) and the major theories that inform our understanding of that practice (e.g., excellence theory, contingency theory, relationship theory).

On the other hand, PR ethicists are grounded in philosophy, typically employing theories of Western ethics in their studies. Perhaps the most widely utilized approaches are the Enlightenment ethics of utilitarianism—most notably championed by John Stuart Mill—and Immanuel Kant's deontological approach. While Enlightenment ethics arguably dominate theoretical approaches to PR ethics, critical theorists have offered alternative ethical perspectives based on a variety of approaches (e.g., postmodernism, Marxism, Jungian psychology). Other theories of ethics based on justice and care have also broadened our perspectives of PR practice, as has renewed interest in Aristotle's pre-Enlightenment virtue ethics.

As such, the objective of PR ethics—providing a means to evaluate right and wrong and the guidance to act morally—becomes predictably murky as

contradictory concepts within and across theoretical and practical domains collide. In particular, competing ethical theories conceptualize both the role of PR and the focal point by which we judge right and wrong differently. Given this state of both the PR and ethics fields, communication ethicist Wendy Wyatt advocates for a pluralistic decision tree through which key concerns of PR can be examined through the lens of multiple ethical theories, resulting in a fuller understanding of the nature of right and wrong within a PR context.

Common Ethical Approaches to PR

This section discusses several theories of Western ethics, including preeminent Enlightenment approaches as well as alternative views.

Enlightenment Ethics

Utilitarianism

PR practitioners are outcome oriented. Success is measured in fostering awareness, affecting behaviors, resolving disputes, and so on. The ability to land new clients for an agency, develop lasting and loyal bonds between a corporation and its customers, recruit a consistent stream of volunteers for a nonprofit entity, or increase voter engagement with public policy are all important outcomes for PR practitioners working in different sectors.

Given this focus on outcome, it is no surprise that scholars have consistently found utilitarianism to be the favored ethical approach of many practitioners. Utilitarianism is a consequentialist ethic, meaning the theory evaluates the goodness of an action based on its consequences—that is, its outcomes. Utilitarianism traces its roots to the 18th- and 19th-century writings of Jeremy Bentham and John Stuart Mill, which were later built upon by Henry Sidgwick and carried forward by contemporary thinkers like Peter Singer.

While the varied approaches to utilitarianism are nuanced, *generate the greatest good for the greatest number* serves as a moral maxim. Problematically, this adage is a simultaneously accurate yet overly simplistic summation of the utilitarian approach. cursory readers of the theory often latch on to the “greatest number” side of the

equation, paying less attention to the “greatest good” aspect. However, both communication and philosophy scholars have painstakingly worked to define this more elusive question: What makes an action “more good”? Common answers of course reference the number of people who benefit, but others include the intensity of the goodness (e.g., curing vs. merely treating a disease), the duration the benefit is felt, and the likelihood that an action will lead to future good acts.

Critics of utilitarianism, particularly in its application to PR, argue that the approach may foster systematic injustice in its favoring of the majority over the minority. The utilitarian would respond that in striving to promote the *aggregate good*, or the good of all persons, highlighting the number of people who benefit from an action is only one factor in calculating that action’s goodness. It is therefore possible for the pain suffered by one individual to be so great that it outweighs the good done for 100; in such a case, the utilitarian would rule in favor of the minority.

Nevertheless, the utilitarian view that all persons are of equal worth complicates this tyranny of the majority critique. While many (perhaps most) would argue for the innate equality of all human beings, individuals do differ, and of particular importance to PR practitioners is their differing relationships with and influence on an organization. PR ethicists generally contend that practitioners and the organizations they serve have certain moral responsibilities to a variety of stakeholder groups: clients, customers, employees, investors, society writ large, and so on. Positive and negative outcomes across groups differ greatly, making apples-to-apples comparisons difficult. Moreover, in practical terms, some stakeholder groups—or even individual stakeholders—exert greater influence over organizational operations; therefore, their concerns may be weighted disproportionately in outcome-oriented decision making, often to the detriment of others, and despite the fact that a utilitarian ethic would demand otherwise.

Deontology

A deontological approach to PR ethics in part seeks to play counterweight to situational injustices by relying on universal rules to govern behavior. Deontology is most closely associated

with 18th-century Prussian philosopher Immanuel Kant and the 20th-century writings of William David Ross. This philosophy also influenced the work of more recent thinkers such as John Rawls, Thomas Nagel, and Thomas Scanlon.

Like utilitarianism, deontology comes in many flavors, but Kant's views are most influential in the PR ethics scholarship. Kant believes the intentionality of an action rather than its outcome more accurately reflects its ethicality. In his view, to act rightly is to act out of a sense of *duty* to the *moral law*, which he defines categorically, meaning that moral law universally deems certain actions obligatory and others prohibited. Through reason and the application of a goodwill, individuals can assess whether a given action is right or wrong based on series of tests, the various formations of which are known as the *categorical imperative*.

Briefly, the categorical imperative commands that we treat all persons as ends unto themselves, not simply as means to achieve some goal, and that we should act only in ways we deem universally acceptable. For instance, Kant views lying as immoral because (a) it disrespects the humanity of the person to whom we lie and (b) we would not wish to live in a world in which, faced with the option of telling the truth or lying, individuals would always opt for the latter. As such, from a deontological view, lying is morally wrong and forbidden in all situations.

Kant's deontological ethic is the most widely applied view in PR ethics scholarship in large part due to the work of Shannon Bowen, who in various writings connects deontology to the two-way symmetrical approach to PR, itself a popular conception of PR practice. Championed by James A. Grunig, the two-way symmetrical approach argues for the creation of mutually beneficial relationships between organizations and their publics by relying on open, two-way communication in which organizations and publics have an equal chance to influence the behavior of the other. Dialogic communication is the favored tool of two-way symmetrical practitioners as it embodies these principles.

Two-way symmetry strives for more egalitarian, balanced relationships between organizations and their publics. As such, the view is similar to deontology in advocating for interactions founded on mutual respect. Deontological thinkers also

believe in the ability of practitioners to develop, adhere to, and govern themselves by universal rules of practice. Many are openly critical of utilitarian ethics as they fear not only the consequences of unequal power balances in moral decision making but also the slippery slope toward moral relativism.

This concern may in part develop from a misunderstanding of the foundational tenets of certain ethical theories. *Moral relativism* asserts that ethical judgments hinge on the perspectives of individuals rather than concrete moral principles. The most ardent moral relativists contend that the standards by which we evaluate right and wrong are as numerous as the individuals making moral choices; hence, there are no general rules or principles of ethics. As a result, many scholars favor the Kantian view of universal moral law over the more anarchistic, anything-goes view of moral relativism.

However, the debate between deontology and moral relativism can be better understood through a long-standing philosophical distinction between *moral generalism* and *moral particularism*, specifically regarding how each views moral principles. Moral principles frame ethical decision making as they serve as explanations as to why actions are right or wrong and subsequently provide guidance to individuals as to how they should behave. Generalists view principles as universally (or near-universally) applicable, whereas particularists do not. It is perhaps best to think of generalism/particularism as a spectrum, with Kantian deontology falling on one side and moral relativism on the other. As such, several ethical theories operate somewhere in between.

Alternative Views

Justice, Care, and Critical Approaches

Critical scholars have greatly contributed to the understanding of PR theory and practice, and the realm of ethics is no exception. Given that the two-way symmetrical view is arguably the dominant paradigm in studying PR practice, ethicists from critical and alternative traditions might best be understood in their relations to two-way symmetry—that is, whether their views of ethical practice support or critique this leading view.

John Rawls's work on justice, and in particular his views regarding fairness, echo the two-way

symmetrical concern for balanced, egalitarian relationships. Rawls distinguishes between *distributive justice*—how goods (often economic) are allocated among members of society—and *procedural justice*—the process through which societies decide how goods should be allocated. While Rawls admits that inequalities are likely inevitable in a liberal society, he strives to ensure they are minimal in nature and arrived at through a fair process. Rawls conceived a thought experiment known as the *veil of ignorance* to test the fairness of how goods are distributed.

Understanding that certain choices benefit some to the detriment of others, Rawls urges moral actors to think of themselves as divorced from their social position. In the case of PR practitioners, they would conceive of themselves not as representatives of an organization but instead potentially occupying the position of any party affected by organizational actions. From this position of ignorance—that is, not knowing who you are or to which group you belong—PR practitioners would then ask themselves whether the proposed organizational action is just and fair. The idea is that we often discount or downplay potential injustices done to others because we know we will likely never occupy their position. The veil of ignorance requires that we consider the fairness of an action from all perspectives.

Feminist ethics of care are also potentially supportive of the two-way symmetrical worldview, though this ethic is only occasionally referenced in PR scholarship. Foundational thinkers in the tradition of care ethics include Carol Gilligan, Nel Noddings, and Virginia Held. *Care ethics* developed as a response to the masculine nature in which philosophical discussions of justice are often framed. Rather than focusing an ethic on a system of universalizable moral judgments based purely on reason divorced from emotion, these scholars focus on the value of care and its role in creating nurturing relationships. Care ethicists uphold that the relationship between mother and child is a pure embodiment of care, calling on us to meet those around us from a position of “one-caring” to foster strong bonds. This focus on developing and nurturing deep relational ties echoes the stated aims of two-way symmetry; however, the demand to focus on situationally dependent aspects of interpersonal relationships

contradicts the more justice-oriented views of Rawls and Kant.

German philosopher Jürgen Habermas’s *theory of discourse* perhaps most closely aligns with the two-way symmetrical worldview and is often cited in PR scholarship to support the efficacy and ethicality of dialogic communication. According to Habermas, for dialogue to be ethical, participants must (a) have an equal chance to initiate and maintain dialogue, (b) have an equal chance to challenge and respond to one another, (c) interact freely without coercion or control, and (d) be equal in terms of power.

Many critical traditions question how common the conditions for Habermasian dialogue are—or in fact whether they ever truly exist. Marxists in particular focus on power imbalances, especially those of economic nature. In PR contexts, this manifests largely over concerns that organizations and publics are rarely equal power players, not only in their ability to influence one another but to influence sociopolitical structures that govern interactions, such as consumer protection or labor laws. Similarly, many PR ethicists argue that practitioners lack the freedom to act autonomously without fear of coercion, given that they are answerable to executives higher up in the organization and that, oftentimes, PR practitioners work within larger organizational departments (e.g., marketing, legal, human relations) and in turn are subjugated to their missions and goals.

More recently, Johanna Fawkes has championed a Jungian approach to PR ethics, arguing that the field has been unable to meld the realities of the practice with the image scholars project of that practice. Several critics of the two-way symmetrical model argue that it favors accommodating publics rather than advocating for organizational positions through persuasive communication. Fawkes asserts that proponents of two-way symmetry are unable to cope and unwilling to face PR’s reliance on persuasion and the field’s roots in propaganda. In attempts to avoid such uncomfortable realities, some scholars have defined PR as wholly separate from propaganda, and oftentimes persuasion more generally, instead of equating PR to coalition building in service of the public interest. Accordingly, this failure to reconcile the “shadow” material of persuasion into a broader understanding of PR has created unnecessary rifts

between scholars and practitioners, further hindering the field's ability to develop a meaningful professional ethic built upon honest self-reflection.

Virtue Ethics

Many critical scholars are thus disenchanted with the Enlightenment ethics of utilitarianism and deontology and therefore propose alternative moral frameworks. Others who feel this same disillusionment have looked to the pre-Enlightenment thinkers, leading to a renewal in virtue ethics, first developed by Aristotle in the 300s BCE. Aristotle's moral framework notably influenced the works of medieval Christian theologian Thomas Aquinas and 18th-century English philosopher David Hume, though 20th-century thinkers like Phillipa Foot, Alasdair MacIntyre, and Rosalind Hursthouse are largely responsible for the theory's resurgence.

Many ethical theories focus primarily on right action, specifically how we judge behaviors as moral or immoral. In contrast, virtue ethics is agent-centered, meaning the moral *character* of the person acting is the principal focus. The general premise asserts that if a person *is* good, he or she will *do* good and that the relationship between moral character and right action is mutually reinforcing.

Virtue ethicists believe that *eudaimonia*—commonly translated as flourishing, happiness, or well-being—is the ultimate end goal of humanity. Eudaimonia extends beyond our everyday understanding of happiness to something more profound, a true or real happiness. Humans achieve this state by cultivating *phronesis*, a sense of moral or practical wisdom that allows us to act appropriately in accordance with the virtues. *Virtues* represent deeply ingrained character traits that help a person act and live well. Aristotle established the four cardinal virtues of prudence, justice, courage, and temperance, arguing that other virtues stem largely from these. While there is no agreed-upon list, charity, understanding, trust, and truthfulness are some commonly cited virtues.

By their very nature, virtues are slippery concepts; therefore, cultivating practical wisdom is necessary for their proper understanding and application. For Aristotle, virtues pave the way

toward human flourishing while vices derail us from that path. In his eyes, vices result from an imbalance in the understanding and application of virtues that trend toward deficiency or excess. For instance, courage is a virtue that provides us the strength to stand up to injustice. When we lack courage, we fall victim to the vice of cowardice, deficient in the strength needed to do right. On the other hand, an excess of courage leads to the vice of foolhardiness, the tendency to seek out or escalate disagreements. Virtues thus represent a *golden mean* between vices of deficiency and excess, and practical wisdom enables us to recognize and maintain a proper balance.

Practical wisdom also helps us achieve balance in other ways. Many virtue ethicists argue that the virtues underpin one another. Practical wisdom helps us to recognize such connections and thus realize how virtues mutually reinforce one another to strengthen overall character. Looking back to the previous discussion of courage, one can readily see how courage is necessary to promote justice.

Finally, while virtues typically coalesce, they occasionally conflict, meaning the adherence to one requires violating another. Practical wisdom helps us balance situational factors so that we might properly comprehend and order the virtues, and thus act well.

Virtue ethics presents a fruitful lens for understanding PR because its major concepts are defined within relational contexts. In the ancient Greek world, the value of developing personal morality laid primarily in such persons' value to a functioning, flourishing city-state. The role of virtues in helping individuals achieve prosperity is therefore far less important than the ability of virtuous agents to work together toward well-being within the broader community.

Given this communal, relational focus, the ultimate source and process of acquiring principles of virtue differ vastly from how Kant theorizes about moral duties. For Kant, moral duties are derived through reason and adherence to universal moral law. Virtue ethicists view individuals as less autonomous, making the process of moral education a more collective effort. Virtues become ingrained character traits through habitual practice; however, there are times when we face moral dilemmas in which we are uncertain about moral rights and wrongs. Virtue ethicists encourage us to look

toward *moral exemplars*, those we uphold in our personal or professional lives as ethically steadfast. Consulting with them personally or looking to examples of how they behaved facing similar circumstances provides valuable guidance.

Ethics and Professionalism

While PR scholars and practitioners engage in seemingly endless debates over which moral approach is best suited to the field, there is near-universal agreement that ethics are critically important in establishing and maintaining the profession. A recognized code of ethics is considered by most to be a prerequisite of professional status; such codes create boundaries between proper and improper methods of practice, thus delineating professionals from amateurs while simultaneously establishing an aspirational vision for the field.

Unfortunately, PR appears trapped in an ongoing identity crisis in which scholars and practitioners struggle to define the field in general, and more specifically an ethic in which to ground it. Though these existential questions still rage—and likely will for some time—PR ethicists continue their search for answers within this thriving sub-discipline of PR.

PUBLIC RELATIONS, HISTORY OF

Public relations can trace its roots to ancient oral traditions in which storytelling served to inform, teach, influence, and advocate. Relating to an

audience depended on speakers and writers believing in their message and then knowing and understanding how to persuade their audience to listen and act on their words. With the expansion of mass communication in the late 1800s and early 20th century, the need arose for individuals, government, industry, and causes to hire experts who knew how to use the media to reach the public. The demand for public relations expertise increased the number of mass communication channels, which proliferated to include print, broadcast, and digital media. Today, public relations touches every aspect of society, and practitioners boast expertise in media relations, lobbying, marketing, social media management, investor relations, public affairs, community relations, and crisis communication. Despite the disruption in journalism and other forms of mass communication, public relations continues to flourish in all areas of society, including government, business, nonprofits, and education.

Historical Roots

Since the invention of the printing press in the 16th century, the rise of public relations has been closely tied to the evolution of journalism and mass communication. The strategic use of communication to influence and change public opinion, however, reaches back a millennium or more. Kings, religious leaders, missionaries, crusaders, social reformers, and merchants have long sought to persuade the masses to support their partisan interests. Aristotle, Socrates, Alexander the Great, and the Apostle Paul employed persuasion. More recently, the Sons of Liberty, Benjamin Franklin, and Andrew Jackson actively sought to rally public support for their causes. The ancients created special events, delivered speeches, developed curriculum, and wrote letters while more recent persuaders relied on handbills, newsletters, newspapers, pamphlets, and books. Even the documentation of the trial of John Peter Zenger represented an effective act of public relations. One of Zenger's patrons, James Alexander, wrote many of the libelous articles that led to the printer's arrest and then made sure to document Zenger's defense by publishing the notes of Zenger's attorney, Andrew Hamilton. This partisan version of the trial arrived in

Britain and its colonies long before the official version and transformed a local political battle into a great moral victory for freedom of speech and the press.

Contemporary scholars, many relying on superficial historical research, contend that public relations emerged in the early 1900s with the creation of the first press bureau and continued to evolve into a profession that served public and private interests. To meet the needs of business and address criticism from the press and the public, the field became more managerial, professional, and ethical. Proponents of this perspective steered public relations away from the more pejorative forms of persuasion, such as propaganda, publicity, and advocacy while touting a more prosocial emphasis on management, relationship building, and dialogue. This perspective conflicts with the historical record. Margot Opdycke Lamme and Karen Miller Russell argued that the field emerged from the deliberate effort to agitate on behalf of partisan causes, advocate for social reform, recruit allies, build goodwill, and establish legitimacy. The history of public relations had less to do with business than with the need to persuade and mobilize public opinion. Before 1900, education, nonprofits, reformers, politicians, government officials, and business executives all engaged in strategic communication—although they were more likely to refer to their work as publicity, propaganda, or advertising.

Progressive Era

In the late 1800s and early 1900s, publicity served as the dominant form of public relations activity. Practitioners were known as *publicists* and in some cases, press agents. However, public relations historians have disputed this connection between publicists and wily press agents such as P. T. Barnum. Press agents pined for press attention and resorted to a number of well-documented hoaxes and exaggerations to accomplish their promotional goals. Publicists, in contrast, sought to influence public opinion through press coverage, special events, and public associations. They justified the need for publicists and publicity by citing the press's bias for bad news, scandals, and conflict. As one observer noted at the time, bad news has wings while good news

needs help. To win coverage for positive news, publicists needed to know what types of events, stories, and people generated news coverage. Thus, publicists played a critical role in promoting the 1893 Chicago World's Fair as well as advocating for political, social, business, and moral reforms. Indeed, they portrayed publicity as a searchlight, cleansing agent, and civic catalyst. The Progressive Era, which started in the 1890s before grounding to a halt during World War I, marked the high point of publicity as a positive weapon for social and moral reform. Examples of Progressive Era publicity included the work of muckraking journalists, partisan newspaper editors, social and political reformers, and advocates for better business practices. Progressives adopted a paternalistic and sometimes coercive approach to improving society while at the same time believing in the public's power to act on prosocial publicity to bring about social and political change.

Popular public relations textbooks and histories contend that the field emerged from the response of big business to muckraking journalism and public scrutiny, but more recent research points to Progressive political leaders advocating for more government oversight and regulation. Others credit the close connection between journalism and public relations as opening the door for corporate journalists and publicists. In reality, key institutions of society—the government, businesses, churches, and charities embraced public relations activities because they recognized the importance of the press and public opinion in advancing partisan interests. Since journalists best understood the press and its processes, they tended to make the best publicists. Thus, public relations' roots in publicity inevitably aligned it with the press and journalism. Albert Shaw, editor of the *Review of Reviews*, speaking to the National Conference of Charities and Correction in 1909, declared, "Get the newspapers with you." Newspapers, he continued, serve as the "organs of publicity, and they are also organs of opinion." Public concerns had genuine news value and by cooperating with the press, reformers accomplished their goals for social improvement. Suffragists, prohibitionists, and other social movements also learned to promote their causes through special events the generated publicity.

Greater public scrutiny meant that big business needed more than just in-house journalists; it required a new type of publicist, one who could advise business leaders on public issues and policy. One of the pioneers of this more consultant role of publicist was Ivy Lee, who in 1904 partnered with veteran journalist George Parker to create a publicity agency. Two years later, while representing anthracite coal operators during a strike, Lee promised to provide prompt and accurate information to the press and public. Although Lee did not always practice his Declaration of Principles, his words inspired generations of professional publicists who could mold and shape public opinion. In 1914, John D. Rockefeller Sr. hired Lee to represent his corporate interests and advocated a policy of informing the public. Lee transformed Rockefeller's image from cutthroat businessman to philanthropist and in the process, gave credibility to the role of communication counselor.

President Woodrow Wilson, an advocate for publicity, engaged Denver newspaperman George Creel to win public support for America's involvement in World War I. Creel turned the Office of War Information into an effective publicity and propaganda machine, promoting the government's war efforts in newspapers, movie houses, and schools. Creel's campaign to win American support for the world war exceeded expectations but also sparked a public backlash. Political leaders condemned the use of public funds to pay for a propaganda campaign to influence citizens. After the war, publicity lost its luster as a Progressive weapon of reform and evolved into a strategic weapon for winning public favor. Although the government continues to curry public favor, its actions were rebranded as public affairs.

Modern Era

In the 1920s, Creel Committee veteran Edward Bernays and other professional publicists also rebranded other forms of publicity as public relations and promoted their role as counselors and special pleaders. Like Lee, Bernays argued that public relations practitioners advocated on behalf of clients in the court of public opinion. By providing the public with information about commercial products and services, these new publicists

promoted commerce and served the public interest. The ethics of their work depended on representing clients worthy of public support. Working with his wife, Doris Fleischman, Bernays reframed public relations as a profession that mediated between organizations and the public. Unlike the publicists and press agents, the public relations counselor advised corporate clients on how to enhance their public image and reputation. Practitioners now sought to determine public opinion and then relay that information back to their organizations, allowing private interests to align with the public interest. Starting in the 1920s, universities began offering publicity courses. Bernays persuaded the Department of Journalism at New York University to allow him to teach a course on public relations.

Although the Great Depression stalled the growth of this new profession, the subsequent recovery required businesses to rebuild its image and regain public trust. Thus, public relations boomed again, and public relations agencies began opening up across the country. In 1927, John W. Hill started a firm in Cleveland, Ohio, focusing on “corporate publicity,” but he soon found that organizations needed a number of services, including internal communication, press relations, and strategic communication. By the 1940s, the firm’s New York office offered more opportunities for growth and expansion, so Hill founded Hill and Knowlton, Inc., which grew into one of the world’s largest public relations agencies. The firm helped clients with crisis communication, media relations, investor relations, corporate communication, and international communication. With demand for public relations skills increasing, especially in major metropolitan areas, practitioners aspired to higher standards. They organized into professional associations.

Universities hired veteran practitioners to teach public relations courses. By 1946, 26 schools were offering public relations courses. Rex Harlow practiced public relations in Oklahoma City before joining the faculty at Stanford University. He taught public relations courses and wrote for academic publications. He also helped form one of the first professional associations for public relations. In 1947, the two largest public relations associations merged into the Public Relations

Society of America (PRSA). PRSA established a code of ethics and emphasized professional training. Its members debated the question of professional licensing for practitioners. Bernays, despite disinterest in PRSA, advocated for licensing. The majority of his colleagues, however, rejected the notion, fearing it violated free speech and encouraged government oversight. PRSA resolved the debate by promoting voluntary accreditation based on having professional experience and the ability to pass rigorous written and oral examinations.

In 1952, public relations educator Scott Cutlip published one of the industry’s most influential textbooks, *Effective Public Relations*. Although publicity remained a tactical part of professional practice, public relations educators and professionals argued for a more prestigious management role that included influencing corporate policy as well as communication tactics. The field adopted a systems theory approach to managing communication in and out of the organizational system. As boundary spanners, practitioners bridged the gap between the organization and its internal and external stakeholders. Public relations managed issues critical to the survival of the organization. Practitioners moved beyond merely disseminating information to engaging in two-way communication with stakeholders and other important publics. Social science research methods helped public relations managers monitor public attitudes and interests and then advise organizational leaders on how to interpret feedback from the public.

Public relations exploded in the 1950s as corporations, government, the military, universities, and other organizations sought public favor. Whereas most public relations practitioners were once concentrated in large metropolitan areas, such as New York City and Washington, D.C., they now hailed from mid-sized cities across the continent. Although corporations generally remained reticent in regard to their ups and downs, they did value positive publicity, especially in the nascent business press. With an increasing demand for content, the business press relied on public relations for information and access to business leaders. Ralph D. Paine, the editor of *Fortune* magazine, warned public relations practitioners about the overabundance of positive stories they supplied to the business press.

If the press published only good news, they would lose credibility and that would not bode well for public relations or journalism. Although practitioners probably agreed with Paine, they were willing to take the risk. Positive publicity provided job security.

As the number of public relations practitioners surpassed 100,000, they received more scrutiny from the press and the public. Vince Packard wrote a best-selling book, *The Hidden Persuaders*, critiquing public relations practice. Writing in *The Atlantic Monthly*, Packard noted that the field had discarded the traditional labels of press agent and publicist and embraced Edward Bernays's title of public relations counsel. The public relations profession boasted that its practitioners had achieved power and prestige as corporate vice presidents and communication executives. Packard admitted that many public relations professionals advocated high standards of practice, but others resorted to using deception and half-truths to influence public opinion. In the 1960s, investigations by the Security and Exchange Commission and other government agencies into corporate publicity and public relations caused some sincere soul searching among practitioners, especially those associated with PRSA.

The Vietnam War and social turmoil of the 1960s and 1970s brought public relations to the forefront in defending government and business. Public relations also promoted businesses to Wall Street and defended corporations from activists and critics, such as Ralph Nader. In the mid-1970s, a recession caused businesses to trim public relations staffs and demand more accountability and measurement. As corporate CEOs became more media savvy, public relations earned more influence over branding and strategy. Public relations agencies expanded their political activities. Indeed, the 1970s and 1980s represented the rise of major public relations agencies including Hill & Knowlton, Carl Byoir & Associates, Burson-Marsteller, Ruder Finn, and Edelman. More and more jobs were filled by graduates trained in public relations rather than journalism.

Digital Era

Through the 1990s and into the 21st century, public relations professionals work in government,

international affairs, business, nonprofit organizations, education, sports, and entertainment. Educators teach two-way symmetrical communication, dialogue, relationship-building, crisis communication, and strategy. Earned media and media relations remain important, but public relations has expanded its role in creating and managing owned media, including organizational accounts on Twitter, Instagram, Facebook, Snapchat, and YouTube. Digital media may have disrupted and savaged journalism but for public relations, it continues to open doors in social media management, social listening, and content creation.

The proliferation of digital media has only served to increase demand for public relations. According to the U.S. Bureau of Labor Statistics, as of 2020, public relations–related jobs in the United States totaled 274,600, with a 10-year estimated growth of 7%. The U.S. public relations industry generated more than \$14 billion in revenue in 2019, and public relations agencies employed more than 54,500 people. At the beginning of the modern era of public relations in the 1920s, the number of journalists outnumbered the number of publicists by a large margin. Today, there are six public relations practitioners for every journalist. Whereas media relations once dominated the work of publicists and public relations practitioners, practitioners now devote more time to digital storytelling and content creation, and social media marketing and management.

PUBLIC SERVICE BROADCASTING

Public service broadcasting, which is sometimes referred to as *public media*, is a federal service administered through the oversight of a corporation and tasked with providing block grants to television and radio extension services that produce journalistic, head start, public affairs, and cultural programming for roughly \$1.35 per person per year. It is a legacy institution of the Progressive Era aspiration that national unity might be improved by agencies designed to promote awareness about the diversity of experiences within our communities, by providing services for self-improvement. Between roughly 1921 and 1967, early public service broadcasters built an alternative media industry to commercial media to guarantee every person the same access to

information and job training. From its origins in state universities, classroom curriculum evolved into radio and television programs that are now associated with Public Broadcasting Service (PBS), National Public Radio (NPR), and a substantial number of cable networks. This entry examines the early history and development of public service broadcasting, the impact of the Communications Act of 1934, the subsequent expansion of public service broadcasting, and public service broadcasting since the passing of the Public Broadcasting Act in 1967.

History and Development

The earliest apocryphal educational broadcasts were made in the 19-aughts, with experiments of live concert relays in San Francisco and West Lafayette. At the time radio had not yet been regulated, and every frequency was open to communication. One might have heard dozens of simultaneous voices on an unprotected channel, in the equivalent of sonic chat room. During World War I, the U.S. government prohibited most forms of radio use. But the University of Wisconsin was selected by the Navy to test directed content between 9XM Madison and the Great Lakes Naval base. Madison broadcasters built their entire station from scratch, even blowing their own vacuum tubes, and called it WHA. WHA is hence usually credited with being the first public service broadcasting station in the United States, due to this head start. One 9XM radio student was chosen to be the radio operator on Admiral Byrd's polar expeditions, another went on to invent radio signal technology. By early 1922, there were already roughly a dozen educational stations up and running. Early educational radio was originally supported by physics and engineering departments at Midwestern state universities, with experimental physicists more interested in measuring transmission of sound waves than the prospects of communication by voice.

But by the early 1920s, educators began to realize radio's promise as a cultural tool. Radio waves could reach large agrarian populations with immediacy, over vast geographic expanses. Distance learning programs initiated in the 1910s latched on to radio and streamlined curricula to reach

adult education students, in the process extending compulsory education programs to farm communities. A theory of the purpose of public service broadcasting emerged around roughly 1925, in dialectical contrast to new commercial broadcasters. The meaning of the service might diverge depending on the community that the station endeavored to reach. But university farm reports, 4-H club, weather emergencies, music appreciation, home economics, and classroom extension lectures marked contrast to the sponsor supported content of local department stores, regional broadcasters, and network affiliates.

Taking their cue from the precedent of the *modern school* and state university philosophies such as the *Wisconsin Idea*, early practitioners believed that the creation of an ethereal *social center* would strengthen the public sphere and promote social connectivity through continuous dissemination of data and perspective. The foundational concept—that educational technology could be utilized to increase equal access to education—inspired rapid public service broadcasting growth through the early 1930s.

In 1925, educators formed a clearing house, first called the Association of College and University Broadcasting Stations, later the National Association of Educational Broadcasters (NAEB), to discuss best practices. Internal correspondence, found in archives across Midwestern universities, detail well the growth of each station, unique genres, and the unique approach that inspired public media. Strides were made in drama, parks service, and primary school music appreciation programming. But as an incipient endeavor, programs were rough and undeveloped. Archival letters of the 1920s detail difficulties in producing broadcasts, from reports of announcers with nasally high-pitched voices, with poor script reading skills, to shows with no perceivable audience; to stations unable to fill airtime, forcing one Iowa DJ to play solo violin for hours to an uncaring audience to keep the station license.

Impact of the 1934 Communications Act

In 1934, the Senate passed its first national media policy: the Communications Act. Faced with frequency scarcity and an abundance of applications, the act stipulated that the infrastructure built by

commercial broadcasters, which did not require state support to maintain facilities, would receive most AM allocations. The consequence was that close to 85% of educational stations suddenly lost their licenses in 1935. The Federal Communications Commission (FCC), which was constituted by the act in 1934, was dismayed by this outcome and released a Pursuant to the Act that clarified a path for how educators might regain their licenses. The basic line of advice, which the FCC determined in concert with the Office of Education, was as follows: (a) that educators had to do a better job of entertaining audiences while educating and (b) to find a way to continuously fund content, since educators were determined to hone their craft without advertising dollars. The result was that the post-Act environment, initially marked by a decimated, scattered educational landscape, transformed into something like a civic movement. Hundreds of institutions and multiple sectors became galvanized that the state universities were right—radio could serve public education—and that technology was fated to do more than entertain, promote, and profit. After 1935, adherents began to search for a way that university stations might reserve a special bandwidth for education.

Improving Educational Broadcasting

University broadcasters studied the practices of the BBC and obtained Rockefeller fellowships to train in station maintenance, audio curricular design, and strategies for how to connect with audiences, setting the precedent for philanthropic underwriting of public media as early as 1936. Concurrently, the president of the University of Wyoming built the first noncommercial media network to reach educational sites in the Rocky Mountains, which he presciently coined as the Rocky Mountain Radio Council “public broadcasting service.” Meanwhile, the FCC and Office of Education organized a Federal Radio Education Committee (FREC) in concert with NBC and CBS, which green-lit a research project to determine how well educational broadcasts fulfilled their educational mandates.

Over the next 10 years, educational broadcasters refined their methods. New modes of distribution appeared at the Universities of Iowa and

Wisconsin. An innovative class of content and format innovators took the helm at Ohio State University. And through FREC, university researchers explored the effects of state university radio on public learning and opinion. The FREC study, which became known as the Princeton Radio Research Project (PRRP), consolidated the methodological foundations of what became known as *communications research*. They had a breakthrough in 1937, when they realized that demographic affiliation could be refined across multiple categories at once ad infinitum, as defined by the listeners themselves. This adjustment—the creation of reflexive demographic categories instead of fitting listeners into preset categories—made it easier to triangulate similar responses among experimental groups, helping educational advocates to satisfy the federal mandate of understanding educational listeners. The PRRP had achieved the remarkable goal of making their method reproducible in different control experiments, eliciting similar demographic responses across geographic space. By the late 1940s, their methods, first developed to understand educational content, became the cornerstone of advertising, product, survey, grant writing, and election approval techniques.

When the United States entered World War II, state university practitioners at the University of Illinois, Iowa State University, and Indiana University enlisted with the office of war information and military training divisions, applied this new technique, and streamlined the clarity and comprehension of instructional broadcasting. After the war, the same figures helped to build Voice of America and other postwar reconstruction projects. By the end of the war, Congress was persuaded to allocate protected frequencies on the new FM dial for educational broadcasting.

With the introduction of television just around the corner, in the late 1940s, educational broadcasting began to look something like today's public media. With the help of philanthropic groups, the military, and federal agencies, reform boosters had improved the quality of broadcasts. But perhaps more importantly, their discovery of triangulatable audience research was effective at measuring public opinion, which made their work attractive to university administrators. Universities began to pour funding into research and

development and audience testing, and between 1950 and 1953, two major events would change the trajectory of public service broadcasting history. The first event was the creation of communication departments. In 1947, the University of Illinois Institute of Communications Research applied audience research as *media effects*, making communication the designated departmental home for educational broadcasting, which further legitimated public service broadcasting. Telecommunications programs were additionally successful at training students for a trade—working in commercial radio. The University of Illinois became the NAEB's home base. From Illinois and WNYC, educators built the *bicycle network*, which figuratively and literally *peddled* shows from station to station, around the country.

Second, the FCC allocated 11.7% protected frequencies for educational television stations in 1952 with the Sixth Report and Order. Armed with TV channels and having realized a vision of nonprofit media distribution, the Ford Foundation became persuaded that the NAEB was prepared to expand into educational television production and research. Between roughly 1953 and 1967, educational broadcasting underwent a measured improvement in quality of content, while expanding its audience. To reach as many students as possible, Ohio State University founded the Midwest Program on Airborne Television Instruction, which literally put a signal tower on an airplane and flew around for 12 h a day to maintain broadcasts in the Midwest. Hagerstown, Maryland, attempted live closed-caption television broadcasts to classrooms. Universities applied the aesthetic qualities of the BBC and network broadcasters to their craft. And by the mid-1950s, the genres associated with public media started to reach aesthetic maturation: travel shows, cooking shows, public affairs, and head start programming.

By the late 1960s, National Educational Radio had produced its third and fourth generation of announcers and producers. In the 1950s, National Educational Television (NET) pooled talent and scripts with the BBC and Ford Foundation, developing programs like NET Playhouse, giving a young Alistair Cooke his start. He'd go on to host *Masterpiece Theater*. The Eastern Educational Network (EEN), which became known as WGBH

in Boston, introduced *The French Chef* and *Mr. Rogers' Neighborhood*. WGBH also imported *Monty Python's Flying Circus*. With the founding of PBS, perhaps the greatest breakthrough came with the formation of the Children's Television Workshop (CTW). The group called upon audience methodologies discovered over the previous 30 years to create perhaps the most important public service broadcasting research consortium of U.S. history, with the most important public television show: *Sesame Street*. Originally a head start grant project, CTW shot early video content and brought it from school to school to screen to students. The material underwent rigorous research and development based on research conducted in communication departments. After a screening, the CTW surveyed response, gauged reception to content by demographic category, and then adjusted aesthetic components of the show from story-world building to the color of each Muppet. Eventually a formula materialized in which social issues such as advocacy for diversity was so well implicitly written into the fabric of the show that viewers no longer noticed that any single scene might feature representations from multiple class, ethnicity, and political viewpoints. Audiences were instead unified counting from 1 to 10, hearing the perspectives of different characters, or searching for Snuffleupagus, one of the many Muppets who would be popularized by the CTW.

The Public Broadcasting Act of 1967

By 1967, public service broadcasting's fortunes had turned around. The Public Broadcasting Act created PBS, NPR, and the Corporation for Public Broadcasting. With support from the Carnegie Commission and multiple Senators, Congress invited the NAEB to migrate producers, show runners, and engineers from state universities to Washington, D.C., Boston, and New York to populate the 4th network. NPR shows such as *All things Considered* and *Fresh Air* employed the first and second female anchors ever on a national network. Instead of instructional broadcasts, NPR favored reporting and conversational public forum style content, and PBS produced and licensed cultural uplift, news, and children's programs.

There are several major takeaways for journalism researchers when examining public service broadcasting's evolution from educational broadcasting during the New Deal to NPR and PBS. From the beginning of mass media in the United States, one finds two complex, successful, innovative approaches that sometimes worked in collaboration, with public service broadcasting and commercial broadcasting. But a fundamental difference in concept over the purpose of technology catalyzed an entirely different mode of production, with different genres, in service of education. The state university belief that education be accessible to every possible student, regardless of background or location, inspired a national media infrastructure.

PUBLIC TELEVISION JOURNALISM

Public television news is an alternative to commercial news programming that positions the audience as information-seeking citizens rather than consumers. The public television model seeks to provide news that is important to a self-governing citizenry regardless of its commercial viability in the broadcast or cable marketplace. Ostensibly free from corporate control, advertising pressures, and the quest for ratings, public television news is generally marked by longer formats, more in-depth coverage of issues, slower pacing, and less focus on visual content compared to commercial news.

Public television news was slow to emerge in the United States. Commercial networks staked early claims to the broadcast spectrum that were subsequently protected by federal legislation. By contrast, in the democracies of Western Europe, public television news was part of a broad public service mandate for broadcasting that existed before the introduction of commercial television, so licensed stations were required to provide balanced news that was independent of both government and commercial interests. This entry first discusses the development of public television in the United States, news programming available on Public Broadcasting System (PBS) and public access television, and some of the problems of public television news in the United States. It then looks like a public television elsewhere in the world.

Public Broadcasting in the United States

In the United States, public television news typically eschews weather, sports, and entertainment news except in the context of reports with wider social, political, economic, or science implications. The absence of commercial interruptions is one of the hallmarks of public television programs.

However, in the United States, programs are often preceded and followed by or interspersed with underwriting credits that use brand names, logos, and information about the sponsoring company and its product. Also, during regularly scheduled national "pledge" drives, news programs are interrupted to ask viewers to make contributions to support public television news.

In the United States, public television news emerged in the mid-20th century in response to at least three concerns raised by critics of commercial television news: (1) that concentration of commercial media ownership into fewer hands invited homogenization of news and narrowing of opinions; (2) that commercial imperatives required news to have an entertainment value that prioritized sensationalism over serious reporting; and (3) that privately owned media relegated viewers to the role of passive receivers of news.

From the earliest years of broadcasting, public media was envisioned as a vehicle for balanced, inclusive coverage and discussion of the day's events. John Macy, the first president of the Corporation for Public Broadcasting (CPB), believed that public perceptions of declining network news standards in the 1960s created a vacuum that public television news could fill. Macy in 1970 set goals for public television news: to provide an alternative to commercial news; to provide a model of rational discourse; and to allow citizens to use television as a platform for expressing their own opinions. Despite such ambitious aims, the failure in the United States to secure reliable long-term funding for public television has left its news programs and documentaries vulnerable to financial and political pressures that have led to increasing commercialization and charges of bias from both left and right-wing critics. Also, the availability of news from cable networks, satellite, and online sources has steadily eroded the audience for public television news.

Development

The forerunner of public television news in the United States was radio programming carried on stations operated mainly by public universities. By the mid-1920s, radio had become an important pipeline of information to farmers, businesses, and
